The mathematical works of Condorcet are numerous, consisting in great part of memoirs in the '*Transactions*' of the academy. In pure mathematics he devoted himself mostly to the development of the differential and integral calculus: he lived during the time when the higher parts of that science began to assume their present powerful form; and his labours on the subject of differential equations must preserve his name in connection with their history. His applications of mathematics are,—1, the problem of three bodies, in which he had no particular success; 2, the application of the mathematical theory of probabilities to judicial decisions, at that time a new and ingenious speculation, the grounds of which are generally misunderstood, but which was treated by Condorcet with a degree of power which entitles his work to no mean rank among those which have led the way to a perception of the extensive bearings of the integral calculus. Condorcet is not in the very first rank of mathematicians, but very high in the second. As a literary author, his '*Éloges des Académiciens morts depuis 1699*,' procured for him the perpetual secretaryship of the Academy of Sciences, and furthered his election to the French Academy. Though decidedly inferior to Fontenelle's '*Éloges Académiques*,' both in point and simplicity, they nevertheless show Condorcet to be a pure and elegant writer, as well as a good judge of the merit of others. His '*Vives of Voltaire and Turgot*,' in which these qualities are most apparent, are moreover distinguished by the enlightened philanthropy, the philosophical zeal, and that desire for improvement, which was always the strongest feeling in the author's heart. The style in which they are written is clear, and if somewhat monotonous, is not altogether devoid of force and spirit. Besides his numerous works (of which he had not time to undertake a regular and careful revision), he contributed several articles to the papers entitled the '*Feuille Villageoise*,' and the '*Chronique de Paris*.' But the grand work of Condorcet was his '*Esquisses du Progrès de l'Esprit humain*,' which he wrote while he was seeking refuge from proscription, and for which he had no other materials except such as he had treasured up in his own vast and capacious memory: it is a work more remarkable for depth of thought than brilliancy of style.

Another of his most remarkable productions was his '*Plan for a Constitution*,' which he presented to the Convention, at whose request he had undertaken to draw up a report on public instruction. His treatise on this subject abounds in enlarged and lofty views, and contains the justest notions on the art of expanding the faculties and forming the character.

Good-nature and kindness were the foundation of his dispositions. If he was deficient in anything, it was in imagination. His outward deportment was cold and reserved, and characterised by a certain

degree of awkwardness and timidity. Nevertheless he possessed more real warmth of feeling and greatness of soul than those unacquainted with him would have suspected. D'Alembert used to characterise him as a volcano covered with snow. His private as well as public conduct was firm, disinterested, and straightforward; and being fully satisfied that a system of equality was the only one compatible with the happiness and real interests of mankind, he made no account of his own rank, title, or fortune, but was willing to sacrifice them all to promote the darling object of his hopes and wishes.

Under the old régime he refused the request of the Academy in 1777 to pronounce an éloge on the Duc de la Vrillière, minister of Louis XV. He subsequently resigned the place which he held under the administration that he might avoid being brought into contact with M. Necker, whom he suspected of having intrigued against his friend Turgot. In the earlier period of the revolution, Condorcet used every effort to bring about those changes which he had so often desired to see accomplished for the good of his country, and became an active member of the Comité des Substances.

Being called to the Convention after the fall of the monarchy, he rallied round the Girondins in order to oppose that portion of the assembly known by the name of Montagnards from their occupying the highest seats in the Convention. In his efforts to found a republic in France upon a philosophical basis, Condorcet sacrificed his life to his opinions. The purity and benevolence of his intentions, and his magnanimous devotion of himself to the cause in which he had embarked, are the imperishable records of his fame. His wife, who was of the family of Grouchy, and one of the most beautiful women of her day, distinguished herself by a correct and elegant translation of Adam Smith's '*Theory of Moral Sentiments*.' Condorcet's works have been collected and published in 21 volumes 8vo.

CONFUCIUS. The real name of Confucius was Koong-foo-tee: the Jesuit missionaries gave it the latinised form in which we use it.

According to some authorities, Confucius lived five centuries and a half, and, according to others, only four centuries and a half, before the Christian era. There is a difference of opinion as to the place of his birth, but that honour is now generally given to the state of Loo, within the district now called K'o-fow Hien, a little to the eastward of the great canal in Shan-tung province, where he was educated, and where he married in the nineteenth year of his age. He was the only son of a woman of illustrious birth. His father, who had several other sons by another wife, held a high government office, but dying some three years after his birth, seems to have left the future philosopher very indifferently provided for. Marvellous stories are told of his love of study when a child, and of his early proficiency in learning and philosophy. The Chinese also record a little fact that may interest phrenologists, namely, that Confucius's head was remarkable for the elevation of its crown. His object in acquiring knowledge was to turn it practically to the purposes of good government, and he accordingly devoted himself exclusively to moral and political science. He divorced his wife after she had borne him a son, "in order," say the Jesuits, who excuse this part of his conduct, "that he might attend to his studies with greater application." When he thought himself sufficiently qualified to instruct the barbarous age in which he lived, he quitted his solitude for the courts of princes. China was not then united under one emperor: this union did not take place until two or three centuries after the philosopher's death. But when Confucius began his mission there seem to have been as many independent kings in China as there were in England under the Saxon heptarchy. From the vast extent of the country, each of these states or kingdoms was probably as large as all England put together. The Chinese were not then more pacific than the rest of mankind: the neighbouring states made war upon each other, and every part of the Celestial empire was in its turn deluged with blood. Not long before the birth of Confucius the horrors of internal warfare had been augmented by some of the belligerents calling in the foreign aid of the Tartars; but when the philosopher commenced his travels a powerful international confederacy had been formed, under which the whole of China was comparatively tranquil. He journeyed through these various states in a condition of simplicity and poverty, devoting himself to the instruction of all ranks in his precepts of virtue and social order. His proselytes gradually increased, and he at length reckoned as many as 3000 disciples, of whom seventy-two were more particularly distinguished by their devotion to their master, and ten were so well grounded in all sorts of knowledge that they were called, by way of excellence, 'the ten wise men.' In his visits to the different princes he endeavoured to prevail upon them to establish a wise and peaceful administration. His wisdom, his birth, his popularity, recommended him to the patronage of the kings, but his laudable designs were frequently thwarted by envy and interest. After many wanderings and disappointments he became prime minister, with a recognised authority to carry his theories into practice in his native country Loo. At this time he was fifty-five years old. In three years he is said to have effected a thorough change in the moral condition of the kingdom. The happiness and prosperity created by the philosophic prime minister excited the jealousy of the neighbouring kings; the sovereign of Loo was soon induced to abandon his benefactor, and Confucius was obliged to fly to the northern parts of China. He was subsequently repulsed at three different courts, to which he applied for office in order that he

might render the people happy; and, after sustaining many other sorrows, he withdrew to the kingdom of Chin, where he lived in great poverty. His doctrines however had taken root, and it was at this time of adversity that his disciples were most numerous. He went again to Loo, his native country, but vainly solicited to be re-employed in the government.

According to some authorities he enjoyed a few glimpses of royal favour in his latter days, being sought after by the rulers of several states, and employed in high offices, which matured his knowledge and experience; but it seems more certain that his rigid principles, and the firm uncompromising manner in which he carried them into practice, always made him many enemies. His zeal endangered his life more than once, but he regarded death with a stoical eye. At length, full of years, if not of honours, he retired from the world, in company with a few of his chosen disciples, to write or complete those works which became the sacred books of the Chinese, and which have survived twenty-two centuries. He died in his seventy-third year. His sepulchre was raised on the banks of the Soo river, and many of his disciples, repairing to the spot, deplored the loss of their great master. The envy and hatred of his contemporaries soon passed away. When peace was restored, and the empire amalgamated, his writings, which had largely contributed to that happy issue, were looked upon as of paramount authority in all matters: and to mutilate, or in any way to alter their sense, was held to be a crime deserving of condign punishment. Unfortunately however the obscurity of the language, and the difficult involuted nature of the written character of the Chinese, rendered involuntary alterations and mistakes of the sense numerous and inevitable.

Though Confucius was left to end his life in obscurity, the greatest honours and privileges were heaped upon his descendants, who have existed through sixty-seven or sixty-eight generations, and may be called the only hereditary nobility in China. They flourish in the very district where their great ancestor was born, and in all the revolutions that have occurred their privileges have been respected. In the earlier part of the 18th century, under the great emperor Kang-hy, the total number of descendants amounted to 11,000 males. In every city, down to those of the third rank, styled Hien, there is a temple dedicated to Confucius. The mandarins, all the learned of the land, the emperor himself, are bound to do him service. This service consists in burning scented gums, frankincense, tapers of sandal-wood, &c., and in placing fruit, wine, flowers, and other agreeable objects, before a plain tablet, on which is inscribed, "O Confucius, our revered master, let thy spiritual part descend and be pleased with this our respect; which we now humbly offer to thee." The ceremony is precisely the same as that which every man is enjoined to observe in the hall of ancestors to his parents, &c.

"It was the great object of Confucius," says a recent writer, "to regulate the manners of the people. He thought outward decorum the true emblem of excellence of heart; he therefore digested all the various ceremonies into one general code of rites, which was called *Le-ke*, or *Ly-king*, &c. In this work every ritual in all the relations of human life is strictly regulated, so that a true Chinese is a perfect automaton, put in motion by the regulations of the *Ly-king*. Some of the rites are most excellent: the duties towards parents, the respect due to superiors, the decorum in the behaviour of common life, &c., speak highly in favour of Confucius; but his substituting ceremony for simplicity and true politeness is unpardonable. The *Ly-king* contains many excellent maxims and inculcates morality, but it has come to us in a mutilated state, with many interpolations." (Gutzlaff, *Sketch of Chinese History, Ancient and Modern*.)

In the writings of Confucius the duties of husbands towards their wives were slightly dwelt upon. On the other hand, the duties and implicit submission of children to their parents were extended to the utmost, and most rigidly inculcated. Upon this wide principle of filial obedience the whole of his system, moral and political, is founded. A family is the prototype of his nation; and, instead of the notions of independence and equality among men, he enforces the principles of dependence and subordination—as of children to parents, the younger to the elder. (Dr. Morrison.) By an easy fiction the emperor stands as the father of all his subjects, and is thus entitled to their passive obedience; and, as Dr. Morrison observes, it is probably (he might say certainly) this feature of his doctrines which has made Confucius such a favourite with all the governments of China, whether of native or Tartar origin, for so many centuries. At the same time it should be observed that this fundamental doctrine has rendered the Chinese people slavish, deceitful, and pusillanimous, and has fostered the growth of a national character that cannot be redeemed by gentleness of deportment and orderliness of conduct.

Confucius was a teacher of morals, but not the founder of a religion. His doctrines constitute rather a system of philosophy in the department of morals and politics than any particular religious faith. (Davis.) Arnauld and other writers have broadly asserted that he did not recognise the existence of a God. (Bayle, 'Philos. Dict.' in article 'Maldonat.') In his physics Confucius maintains that "out of nothing there cannot possibly be produced anything; that material bodies must have existed from all eternity; that the cause ('*lee*, reason) or principle of things must have had a co-existence with the things themselves; that therefore this cause is also eternal, infinite, indestructible,

without limits, omnipotent, and omnipresent; that the central point of influence (strength) whence this cause principally acts is the blue firmament ('*Tien*'), whence its emanations spread over the whole universe; that it is therefore the supreme duty of the prince, in the name of his subjects, to present offerings to *Tien*, and particularly at the equinoxes; the one for obtaining a propitious seed-time, and the other a plentiful harvest." He taught his disciples that the human body is composed of two principles—the one light, invisible, and ascending; the other gross, palpable, and descending: that on the separation of these two principles the light and spiritual part ascends into the air, whilst the heavy and corporeal part sinks into the earth. The word 'death' never enters into his philosophy; nor on common occasions is it employed by the Chinese. (Barrow.) When a person dies, they say "he has returned to his family." The body, it was difficult to deny, resolved itself into its primitive elements, and became a part of the universe; but, according to Confucius, the spirits of the good were permitted to visit their ancient habitations on earth, or such ancestral halls or other places as might be appointed by their children and descendants, upon whom, while they received their homage, they (the dead) had the power of conferring benefactions. Hence arose the indispensable duty of performing sacred rites in the hall or temple of ancestors; and all such as neglected this duty would be punished after death by their spiritual part being deprived of the privilege of visiting the hall of ancestors, and of the supreme bliss arising from the homage bestowed by descendants. A belief in good and evil genii, and of tutelary spirits presiding over families, houses, towns, and other places, inevitably arose out of this system. It does not appear however that either Confucius or any of his followers attached the idea of a personal being or form to the Deity; nor have the true Confucians ever represented the Great First Cause under any image or personification whatsoever. The images and idols of China belong to other faiths. It was soon found that the notions of Confucius were too abstract and ideal for the mass of his countrymen, who, like the rest of mankind in nearly all ages and all countries, required something material to fix their attention and excite their devotion.

The moral doctrines of Confucius include that capital one, which, however neglected in practice, has obtained in theory the universal assent of mankind; he taught his disciples "to treat others according to the treatment which they themselves would desire at their hands." In his doctrines there is an evident leaning to predestination or fatalism, and to fortune-telling, or predicting events by the mystical lines of *Fo-sheo*. With all his defects and omissions, Confucius was however a most wonderful man. His system, without making any pretension to a divine legation, still continues to prevail throughout the most extensive empire in the world. Some religions may have lasted as long, or longer; but we believe no philosophic code can claim anything like such a lengthened period of active practical existence. The Tibetan, the Buddhist, and other religions, have divided, and still divide influence with it, but have never overthrown its empire. The superstitious and the vulgar of all classes, from the emperor on the throne to the poor sailor on board the junk, may burn gilt paper and offer sacrifices to wooden idols, practise incantations, and offer up prayers to the "invisible mother of heaven;" but, at the same time, they all revere the name of Confucius, and the more enlightened pretend to be wholly guided by his merely philosophical code. The body of his laws and instructions is still followed, not only by the Chinese, but by Koreans, Cochinchinese, and other people, who, taken collectively, are estimated at 400,000,000 of souls.

The classical or sacred works written and compiled by Confucius and his disciples are nine in number; that is to say, the 'Four Books' and the 'Five Canonical Books.' The first of the 'Four Books' is the '*Ta-heo*,' or 'The School of Adults'; the second the '*Choong-yoong*,' or 'Infallible Medium'; the third the '*Lun-yu*,' consisting of the conversations and sayings of Confucius, recorded by his disciples, and which, according to Sir J. F. Davis, is "in all respects a complete Chinese '*Boswell*,'" and the fourth the '*Meng-tse*,' which contains the additions and commentary of *Meng-tse*, or Mencius, as he is called by Europeans, who lived about a century after Confucius. The 'Five Canonical Books,' all said to be written or compiled by Confucius himself, are, the '*Shy-king*,' or 'Book of Sacred Songs'; the '*Shoo-king*,' which is a history of the deliberations between the ancient sovereigns of China; the '*Ly-king*,' or 'Book of Rites and Ceremonies,' which is considered as the foundation of the present state of Chinese manners, and one of the causes of their uniform unchangeableness; and lastly, the '*Chun-tsieu*,' which is a history of the philosopher's own times and of those which immediately preceded him.

(Sir J. F. Davis, *The Chinese: a General Description of China and its Inhabitants*, London, 1836; Gutzlaff, *Sketch of Chinese History, ancient and modern*; *Travels of the Jesuit Missionaries*; Bell (of Antermony), Barrow, Staunton, &c.)

CONGLETON, RIGHT HONOURABLE HENRY BROOKE PARNELL, LORD, was born 3rd of July 1776, and was the second son of the Right Honourable Sir John Parnell, Chancellor of the Irish Exchequer; his mother was Letitia Charlotte, second daughter and co-heir of Sir Arthur Brooke, of Colebrooke, in the county of Fermanagh, Bart. He was educated at Eton and Cambridge, and after leaving the university he spent some time abroad. His elder brother having been born a cripple, and incapable of articulating, the estates

had, in 1789, been settled by act of parliament upon Henry, and he came into possession of them upon the death of his father in 1801. The baronetcy, an Irish one, fell to him upon the death of his brother in 1812.

On the 17th of February 1801, Mr. Parnell married Lady Caroline Elizabeth Dawson, eldest daughter of John, first Earl of Portarlington, and granddaughter of the Earl of Bute, George III.'s prime minister; and at the general election in 1802 he was returned to Parliament for the borough of Portarlington, of which his father-in-law was the political patron. But a few weeks after the opening of the session he resigned his seat to make way for Mr. (afterwards Sir) Thomas Tyrwhitt; and he remained out of parliament till March 1806, when he was again returned as one of the members for Queen's County. This seat was commanded by the conjoint influence of his own property, of that of Lord Portarlington, and of that of Lord De Vesci, who was also his near relation. Sir Henry sat in every succeeding parliament as one of the members for Queen's County till the general election in 1832, when he declined a contest with the Repeal of the Union party, and Mr. Lalor was elected in his place. In April 1833, he was returned for Dundee; and he was elected again for the same place in 1835 and 1837. In August 1841 he was removed to the Upper House by being created Baron Congleton, of Congleton, in the county of Chester, from which county the Parnell family originally came.

Sir Henry Parnell's political course was throughout that of an adherent to the most liberal section of the Whig party. Upon the accession of the Whig ministry in 1806 he was made a Lord of the Treasury in Ireland. He made the motion on the civil list which dissolved the ministry of the Duke of Wellington in the end of 1830; and on the accession of his friends to power, which followed, he was made Secretary at War. In 1832 however a difference with his colleagues on some financial points led to his resignation; and he remained out of office till the formation of Lord Melbourne's administration in 1835, when he was made paymaster of the forces and treasurer of the ordnance and the navy, both which offices he retained till the breaking up of the ministry to which he belonged in August 1841. He had also served as chairman of the finance committee appointed by the House of Commons in 1823. In 1833 he was made a member of the government commission appointed to inquire into the excise; and he was also chairman of the Holyhead Road commission. In each of these investigations he took a leading part. Lord Congleton had been for some months in a state of health which made it necessary that he should be carefully watched; but on the morning of the 8th of June 1842, having been left for a few minutes alone, he put an end to his life. He left two sons and three daughters.

Besides corrected reports of five speeches which he delivered in the House of Commons, Sir Henry Parnell published the following treatises and pamphlets:—'Observations on the Currency of Ireland, and upon the Course of Exchange between London and Dublin,' 1804; 'The Principles of Currency and Exchange, illustrated by Observations on the State of Ireland,' 1805; 'An Historical Apology for the Irish Catholics,' 1807; 'A History of the Penal Laws against the Irish Catholics, from the Treaty of Limerick to the Union,' 1808; 'Treatise on the Corn Trade and Agriculture,' 1809; 'Observations on the Irish Butter Act,' 1825; 'Observations on Paper Money, Banking, and Overtrading,' 1827; 'On Financial Reform,' 1830 (his principal work, several times reprinted); and 'A Treatise on Roads,' 1833, reprinted 1838.

CONGREVE, WILLIAM, was the second son of Richard Congreve of Congreve in Staffordshire, and was born at Bardes, near Leeds, in Yorkshire. His father, who held a commission in the army, took him over to Ireland at an early age, and placed him first at the Great School at Kilkenny, and afterwards under the direction of Dr. St. George Ashe, in the University of Dublin. After the revolution in 1688 he returned to England, and was entered as a student in the Temple. His first play, written at the age of nineteen, was the 'Old Bachelor,' which was produced with great applause at Drury-Lane in 1693; and Dryden is said to have remarked that he had never seen such a first play. The next year he produced 'The Double-Dealer,' and in 1695, joining with Betterton, they commenced their campaign at the new house in Lincoln's Inn Fields with a new comedy written by Congreve, called 'Love for Love.' In 1697 he produced his tragedy of 'The Mourning Bride,' and two years afterwards the comedy of 'The Way of the World.' The indifferent success of this last play disgusted him with the theatre, and he determined to write no more for the stage. Through the friendship of his patron the Earl of Halifax, he was first made one of the commissioners for licensing hackney-coaches, then presented with a place in the Pipe Office, and after that with one in the Customs, worth 600*l.* per annum. On the 14th of November 1714 he was appointed commissioner of wine licences, and on the 17th of December, in the same year, nominated secretary of Jamaica. The last twenty years of his life were spent in retirement, and towards its close he was much afflicted with the gout and with blindness. Being overturned in his chariot on a journey to Bath, he received, it is supposed, some internal injury, and, gradually declining in health, died on the 19th of January 1729, at his house in Surrey-street in the Strand, London, aged fifty-seven, and was buried on the 26th of

January in Westminster Abbey. Mr. Congreve was also the author of a romance called 'The Incognita, or Love and Duty reconciled,' written at the age of seventeen; 'The Judgment of Paris,' a masque; 'Semele,' an opera, and several poems. Congreve was as Johnson truly enough observed, undoubtedly an 'original' writer, as he "borrowed neither the models of plot, nor the manner of his dialogue." But the plot is confused, and in the conduct of it little attention is given to propriety or probability. His characters are untrue, and artificial, with very little of nature, and not much of life. His scenes seldom exhibit humour or passion; his personages are a kind of intellectual gladiators—every sentence is to ward or strike; the contest of smartness is never intermitted; his wit is a meteor, playing to and fro with alternate coruscations. He has abundant wit, but it is neither very original nor very choice, and as cold and feeble as genuine wit can well be. His only tragedy, 'The Mourning Bride,' although very successful, is a piece of unrelieved bombast. 'Love for Love' is the only play of Congreve's which has still possession of the stage, and even that is rarely acted, as its wit cannot atone for the exceeding grossness of the dialogue.

CONGREVE, SIR WILLIAM, BARONET, was the son of the first baronet, an artillery officer of the same name, and was born in Middlesex May 20, 1772. He was destined by his father to a military life, and in 1816 had attained the rank of lieutenant-colonel of artillery, when he retired from the service.

He very early distinguished himself by his inventions in the construction of missiles. The rocket which bears his name was invented in 1808, and proved a most destructive engine. It was used with great effect by Lord Cochrane in his attack on the French squadron in the Basque roads, at Walcheren, and at Waterloo, and the Emperor of Russia sent Sir William the decoration of St. Anne for its service at the battle of Leipzig in 1813. The rocket has however been much modified and improved since, and become an essential part of every armament, not in England alone, but universally. Sir William, who succeeded his father as baronet in 1814, had sat in parliament for Gatton in 1812, and in 1820 and 1826 he sat for Plymouth. He was patronised by the Duke of York, took an active part in the improvements and ameliorations introduced by him into the army, and was inspector of the royal laboratory at Woolwich. In 1816-17 Sir William was appointed to attend on the Grand-Duke Nicholas (afterwards Emperor of Russia) on his tour through England. In 1826, when the speculative mania ran high, Sir William became connected with the Arigna Mining Company: he in fact contracted to sell certain mines to the company of which he was to become a director. The honesty of the contract was impugned, and became the subject of a suit in chancery, and the Lord Chancellor decided that the transaction was fraudulent. This decision was announced on May 3, 1828; Sir William retired to Toulouse, and there he died on the 14th of the same month.

Sir William wrote and published 'An Elementary Treatise on the Mounting of Naval Ordnance,' 1812, and 'A Description of the Hydro-pneumatic Lock,' 1816. In 1815 also he obtained a patent for a new mode of manufacturing gunpowder; and in 1819 a patent for the manufacture of bank-note paper for the prevention of forgery.

CONON, an Athenian general, was the son of Timotheus. The first time he is mentioned in history is B.C. 413, in the eighteenth year of the Peloponnesian war, when he had the command at Naupactus on the Corinthian gulf. (Thucyd. vii. 31.) Conon was the chief of the ten generals who were appointed to the command of the Athenian fleet, when Alcibiades and Thrasylus were removed from office, and, though at first beaten in a sea-fight by Callicratidas [CALLICRATIDAS] the Lacedæmonian general, he afterwards gained a signal victory at Arginusæ. Lysander being appointed a second time to the command of the Spartan fleet, engaged with Conon at Egospotami, and defeated him, B.C. 405. Immediately despatching to Athens the sacred ship 'Paralus' with the news of the defeat, Conon himself fled to Salamis in Cyprus, where the friendship of the king, Evagoras, sheltered him from the obloquy or punishment which he would have encountered at home.

Isocrates has given us a pleasant picture of the intimacy which subsisted between the Athenian general and the Prince of Salamis during Conon's residence in Cyprus. Here for a time he kept aloof from action, watching attentively the progress of affairs; the negotiations, which he commenced with the Persian satrap Pharnabazus, terminated in a speedy union of the Persian and Athenian forces with those of Evagoras, with the view of stopping the progress of the Lacedæmonians. Evagoras, Conon, and Pharnabazus together, raised a powerful fleet, in the command of which Pharnabazus was materially assisted by the experience of Conon. Falling in with the enemy's fleet near Cnidus, they gained a complete victory, B.C. 394. The galley of the Spartan general, Peisander, being driven on shore, most of his crew escaped; but Peisander disdained to save himself by flight, and was killed on board his ship. The consequences of this victory were of great importance to the interests of Athens; and Isocrates ('Philip,' §§ 91, 95) represents Conon as having completely destroyed the Lacedæmonian empire. Of the Grecian islands, some surrendered at once, and others showed a readiness to renew their old alliance. This was a juncture too favourable to be lost sight of, and accordingly Conon and Pharnabazus hastened to follow up their success by an invasion of the Thracian Chersonese. Town after town submitted to

them, and the people abandoned their lands. Sestos and Abydos still held out, but the approach of winter at last put an end to the attempt at reducing them, and the satrap and Athenian admiral began to prepare for the operations of the ensuing spring, at the commencement of which they proceeded without delay to the coast of Laconia, and ravaged the country in various parts, *A.C.* 393. Conon seized the opportunity, which the flush of their present success afforded, for obtaining from Pharnabazus many important favours for his country. The satrap allowed him the use of his fleet for recovering the payment of tribute from the islands, and not only gave a large sum of money towards the rebuilding of the long walls at Athens, which had been demolished by the Spartans at the close of the Peloponnesian war, but sent men to assist in the work. At this time Conon appears to have returned to Athens, amidst the joy and congratulations of his countrymen: his portrait, with that of Evagoras was placed beside the statue of Zeus Soter, as a memorial of their gratitude.

At the time when Antalcidas was sent on an embassy from Sparta to conclude a peace with the Persian king, Conon, the Athenian ambassador, was one of those who refused to give their assent to such terms as were proposed for their acceptance. The result was that he was imprisoned by the Persian minister Teribazus, on pretence of his adopting measures detrimental to the great king. What became of him afterwards we have no certain information. According to some he was brought up before the king himself and put to death; while others affirm that he escaped from confinement. He probably escaped to Cyprus, where he had considerable property. Lysias, who ('On the Property of Aristophanes,' §§ 635-646) gives an account of Conon's property in Cyprus, states that it was disposed of after his death. The words of Lysias (§ 640) certainly imply that he died a natural death, and was not murdered. He appears to have died about *A.C.* 388. (Clinton, 'Fast. Hel.') He had a wife in Cyprus at the time of his death.

(Isocrates and Lysias, as cited above; Xenophon, *Hellenica*, i. 4-7; iv. 3-8; Diodorus Siculus, xiii. and xiv; Nepos, *Life of Conon*; Plutarch, *Life of Lyander*, and of *Artaxerxes*.)

CONON, of Alexandria, a friend of Archimedes, in whose writings he is mentioned as having a great knowledge of geometry. He was the proposer of the spiral which bears the name of Archimedes. Seneca says that he made a collection of the observations of eclipses made by the Egyptians; and he is said to have given the appellation Coma Berenices to the constellation so named. None of his works have been preserved.

CONRAD I., Count of Franconia, was elected king of Germany *A.D.* 911, on the death of young Ludovic IV., the son of Arnulf, and the last of the Carolingian dynasty in Germany. He was chiefly engaged during his reign in making his authority respected by the turbulent dukes or great vassals, his electors; among whom Henry, duke of Saxony and Thuringia, was the most powerful and most troublesome. The Huns too attacked Germany, and pushed their depredations as far as Bavaria. Conrad went to oppose them, and received a mortal wound in battle, December 919. In his last moments, knowing the ambition and power of Duke Henry, he recommended to his brother Eberhard and his other relatives the propriety of renouncing their own views, and of electing the Saxon duke as the only means of giving peace and stability to Germany. His advice prevailed, and Henry, called the Fowler, was elected after his death by the title of Henry I. Conrad was never crowned emperor or king of Italy, the Italians having chosen a separate king, Berengarius, marquis of Friuli.

CONRAD II., called the Salic, duke of Franconia, was elected king of Germany after the death of Henry II., in 1024. He annexed the vast dominions of Burgundy to the German confederation, forced the king of Poland to do homage for Silesia, and ceded the duchy of Schleswig to Canute, king of Denmark, as a fief, on the same condition. The great feudal nobles of Italy were at variance among themselves and with the towns. They had acknowledged the princes of the House of Saxony for their kings, and Conrad their successor crossed the Alps to enforce a like submission. He was crowned king of Italy at Monza by Heribert, archbishop of Milan, in 1026, after which he convoked a general diet of Lombardy in the plain of Roncaglia, near the Po, not far from Piacenza. In this diet he regulated the feudal legislation of Italy, the jurisdiction of the great feudatories, the successions, &c. He then proceeded to Rome, where he was crowned in 1027 by Pope John XIX., as emperor and king of the Romans, with the titles of Cæsar and Augustus: his wife, Gisela, was crowned empress at the same time. Two kings, Rudolf III. of Burgundy and Canute of Denmark, were present at the ceremony.

Rudolf of Burgundy having died in 1033, the crown of that kingdom devolved upon Henry, Conrad's son, and Rudolf's nephew by his mother; but it was not without a war that Conrad secured his son's inheritance. About 1035 there was a general rising in Lombardy of the vassals, or sub-feudatories, against the great lords, secular and clerical, and especially against the archbishop of Milan. A battle was fought between Milan and Lodi, in which the archbishop was defeated, and the bishop of Asti was killed. In 1036 Conrad marched into Italy with an army to quell the disturbances; he deposed Heribert and imprisoned him, but the people of Milan rose in favour of their archbishop, and resisted all the forces of the emperor. During the

two years that Conrad passed in Italy he visited Rome and Monte Casino, deposed Pandolfo, prince of Capua, and gave the principality to his brother. A pestilence having spread among the imperial troops in 1038, Conrad returned into Germany, and in June 1039 died at Utrecht. He was succeeded by his son, Henry III.

CONRAD III., of the House of Hohenstauffen, Duke of Franconia, and nephew of Henry V., was elected king of Germany in 1138, after the death of Lotharius II., who had succeeded Henry. Conrad had already been proclaimed King of Italy during the life of his uncle. Henry the Proud, of the House of Welf, duke of Saxony and of Bavaria, who had married Lotharius's daughter, and whose sway extended from the Baltic to the Alps, had also pretensions to the imperial crown. Conrad, assembling a diet at Würzburg, stripped Henry both of Bavaria, which he bestowed on Leopold V., margrave of Austria, and of Saxony, which he bestowed on Albert the Bear, who was descended from the ancient dukes of that province. A civil war was the result: Henry the Proud preserved Saxony, but dying in the midst of the war, his rights descended to his infant son Henry, afterwards styled the Lion. Welf, brother of Henry the Proud, expelled Leopold from Bavaria. A battle was fought at Winsberg in Suabia, between Welf and Conrad, which was lost by the former, and is memorable as having given rise to the distinctive names of Guelphs and Ghibelines, which became the rallying words of two opposite parties that desolated Germany and Italy for centuries. At the battle of Winsberg, the war cry of the Saxons and Bavarians was that of their leader 'Welf;' and that of the imperial troops was 'Weiblingen,' a town of Würtemberg, the patrimonial seat of the Hohenstauffen family. The two names were originally applied to the respective adherents of the Saxon duke and of the emperor; but that of Welf soon became extended to all the rebels or disaffected to the imperial authority. The Italians, adopting the distinction long after, named Guelphs all the opponents, and Ghibelines the supporters of the imperial authority in Italy. [GUELPHS AND GHIHELINES.]

For the moment however peace was made in Germany: Henry the Lion was acknowledged Duke of Saxony, and gave up Bavaria to the margrave of Austria. Albert the Bear was indemnified for the loss of Saxony by the erection of Brandenburg into an independent margravate, which his own successes over the Slavonic tribes bordering on the Baltic soon raised to an equal rank with Saxony, Bavaria, Suabia, and the other great provinces of the empire. Having thus given peace to Germany, Conrad was induced by the preaching of St. Bernard to assume the cross. He set out with a numerous host for the East, by the way of Constantinople. In conjunction with Louis VII. of France, he penetrated into Syria, and besieged Damascus and Ascalon, but without success. Conrad having lost most of his followers, returned disappointed to Germany, which he found again distracted by the intrigues of Welf. He defeated Welf, and died in 1152, as he was preparing to set out for Italy to receive the imperial crown from the hands of the pope. He was succeeded by his nephew, Frederick of Hohenstauffen, duke of Suabia, surnamed by the Italians 'Barbarossa.'

CONRAD IV., son of Frederic II. emperor of Germany, and king of Italy and of Sicily, was elected King of the Romans in his father's lifetime; but at the death of Frederic, in 1250, he found a competitor for the crown of Germany in the person of William of Holland, who was supported by all the influence of Innocent IV. The pope excommunicated Conrad, as the son of the excommunicated Frederic, and released all his subjects of Germany and Italy from their allegiance. This was an epoch of the greatest animosity in Italy between the Guelphs and the Ghibelines. The popes were bent on the destruction of the house of Hohenstauffen, the great leaders of the Ghibelines, who had stoutly resisted the universal temporal sovereignty which was assumed by the see of Rome. Naples, Capua, and other towns of Apulia and Sicily, revolted against Conrad, but Manfred, the natural son of Frederic, who had been left regent of the kingdom in the absence of his brother, brought back most of them to their allegiance, and laid siege to Naples.

In 1251 Conrad, on arriving in Italy, was well received by the Ghibeline party, which was strong in Lombardy, especially at Verona, Pavia, Cremona, Piacenza, Tortona, Pistoia, and Pisa. In 1252 Conrad passed into Apulia, and on receiving the oath of allegiance from many of the barons, he asked the pope for the investiture of the kingdom of Sicily and Apulia; but the pope maintained that all Conrad's rights were forfeited through the rebellion of his father against the authority of the church. Conrad, strengthening his army with the Saracen colonists who had been removed from Sicily by his father and settled in Apulia, at Lucera, and in the neighbourhood, took Naples after an obstinate defence, and razed the walls of that town. Meantime the pope was offering the crown of Sicily, first to Richard of Cornwall, afterwards to Edmund III., son of Henry Crookback, of England, and lastly, to Charles, count of Anjou, who accepted it. In 1254, while Conrad was preparing to return to Germany to oppose William of Holland, he was taken ill at Lavello, in Apulia, and died soon after. The Guelphs spread a report that Manfred had poisoned him in order to possess himself of the crown of Sicily and Apulia, as they had already accused him of having hastened the death of his father Frederic; but these reports are deserving of little notice. Conrad left one only son, called also Conrad, who, on account of his

tender age, was styled by the Italians Conradino, or little Conrad. [CONRADIN.] The young prince was brought up in Germany, and Manfred remained regent of the kingdom of Sicily and Apulia in the name of his nephew. For the Ghibeline version of all those transactions, see Raumer's 'Geschichte der Hohenstauffen,' and for the Guelph part, the numerous Italian writers, and Sismondi's 'Histoire des Républiques Italiennes.'

CONRADIN, CONRADINO, son of Conrad IV. and of Elizabeth of Bavaria, was an infant when his father died in 1254. He was acknowledged as Duke of Swabia, but his father's splendid inheritance of Sicily and Apulia passed into the hands first of Manfred and afterwards of Charles of Anjou, by the battle of La Grandella, 1265, in which Manfred was killed.

In the autumn of 1267, Conradin, when only 16 years of age, set out for Italy at the head of a few thousand men. At Verona he was well received by the great Ghibeline leaders of northern Italy. He entered Rome without opposition, the pope being then at Viterbo, and thence took the road of the Abruzzi. He met his opponent, Charles, at Tagliacozzo, near the Lake of Celano, on the 23rd of August 1268. The battle was long contested; the Germans had at first the advantage, and, elated with success, were pursuing the French, when Charles, who had been lying in wait, came up with his reserve and completely routed them. Conradin escaped from the field of battle with his cousin Frederic, duke of Austria, and others, and descending from the mountains reached the village of Astura, on the sea coast near the Pomptine marshes, expecting to find some means of reaching the fleet of his allies the Pisans, which was in the neighbourhood. But John Frangipani, lord of Astura, seized upon him and delivered him up to Charles for a sum of money. He was taken to Naples, tried, and, notwithstanding the protest of a celebrated jurist, Guido da Luzzano, and others, he was condemned and beheaded in the market-place on the 29th of October 1268, together with Frederic of Austria and several of their followers. The story of the glove said to have been thrown down by Conradin from the scaffold, to be delivered to Peter of Aragon, the husband of Constance, daughter of Manfred, does not seem sufficiently authenticated. A chapel was raised on the place of the execution. The chapel no longer exists; but in the vestry of the new church of Santa Croce al Mercato, built opposite to it, is a small column of porphyry, which once stood on the very spot of the scaffold, with a Latin distich commemorative of the event. (Valéry, 'Voyages en Italie.') Conradin's mother hastened from Germany to ransom her son. Coming too late, she used the money in founding the great convent Del Carmine, where the remains of Conradin and Frederic of Austria were deposited behind the great altar.

CONSALVI, ERCOLE, CARDINAL, born at Rome in June 1757, studied for the church, but applied himself likewise to belles lettres, music, and the arts. He became a monsignore, or prelate attached to the papal court, and was made, by Pius VI., Uditore di Rota, or member of the highest civil court of the Roman state. When Cardinal Chiaramonti became pope he made Consalvi, whom he knew and appreciated, a cardinal deacon, with the title of Santa Maria ad Martyres, in August 1800, and appointed him at the same time his secretary of state, or first minister.

In 1801 Consalvi repaired to Paris, and concluded the concordat with the first consul, Bonaparte. His pleasing manners and liberal opinions procured him marked attention during his stay in the French capital. In 1806, when Bonaparte began to quarrel with the pope, he insisted upon Consalvi being removed from his office, under the pretence that he was ill affected towards him, which meant in reality that he defused the interests and rights of his own sovereign. Consalvi himself urged the pope to accept his resignation for the sake of peace. Pius at last unwillingly received it, and appointed Cardinal Casani his successor. Consalvi remained at Rome during the following years until the abdication of the pope in 1809. After that event he was exiled from Rome with the other cardinals, but some time afterwards he was allowed to join the pope at Fontainebleau. On the release of the pope, and his return to Rome in 1814, Cardinal Consalvi was reinstated in his office of secretary of state, and continued the presiding minister of the court of Rome till the death of Pius, 20th of August 1823. Consalvi did not long survive his master and friend, to whom he had been faithfully attached through all the vicissitudes of a long and stormy pontificate, and between whom and him there was both sympathy of mind and mutual confidence. [PIUS VII.] Cardinal Consalvi died at Rome, January 24, 1824. He was buried in the church of San Marcello, where a monument was raised to him by the sculptor Rinaldi. An excellent full-length likeness of him by Sir Thomas Lawrence is in the royal gallery at Windsor.

Consalvi's administration of the papal state forms an epoch in the history of modern Rome. He abolished numerous abuses and old customs which were no longer in accordance with the state of society. He was favourable to rational change. By the Motu Proprio of 1816 all feudal taxes, monopolies, and exclusive rights, were suppressed. Torture and the punishment of the cords, or estrapade, the use of which had long disgraced the most frequented street of Rome, were likewise abolished, as well as the punishment of death for the indefinite and undefinable offence of heresy. A new civil code, a commercial code, and a penal code, were ordered to be framed. The maintenance of the registry of mortgages (introduced by the French), a better system

of police, and the establishment of workhouses for the poor in the principal towns, are among the results of Consalvi's administration. He also took strong measures to extirpate the banditti from the Campagna, and in one instance, July 1819, he ordered the town of Sonnino, one of their notorious haunts, to be razed to the ground. New concordats were entered into with France, Naples, Bavaria, and other German states.

CONSTABLE, JOHN, was born at East Bergholt, in Suffolk, in 1776. His father, Golding Constable, was a miller, and John, the second son, was originally intended for the church; but as he showed an aversion or disinclination to study, his father gave up this design and endeavoured to make a miller of him, in which business Constable was actually engaged for about a year. His time was however chiefly spent in contemplating and studying the characteristics of natural scenery: he displayed much originality of observation in his attempts at portraying its beauties, and his mind became gradually engrossed in sketching and the study of landscape. His taste for art had early displayed itself: when at school at Dedham he was in the habit of neglecting his lessons for his pencil.

The result was his adoption of landscape-painting as a profession, and in this he was instructed by R. R. Reinagle, R.A., and he received much encouragement from Sir George Beaumont. In 1795 he visited London, but returned to his native place; in 1799 he again visited London with a view to try his fortune, and in 1800 he was admitted as a student into the Royal Academy. For many years he was a steady exhibitor in the Royal Academy, but his works attracted little attention, owing probably to the unpretending nature and extreme simplicity of his style. He professed to despise, and probably did despise all styles and conventionalities; he used to say, "There is room enough for a natural painter; the great vice of the day in *bravura*—an attempt to do something beyond the truth." He was right; and in no great number of years his merits were acknowledged by the public.

In 1820 Constable took a house at Hampstead, where he chiefly resided; he had also a house in Charlotte-street, Fitzroy-square, where he kept a gallery of his works, for, though admired, many of his paintings remained on his hands. At length in 1829 he received the tardy professional acknowledgment of his merits by his election as a Royal Academician: he was then in his fifty-third year. He was taken ill on the night of the 30th of March 1837, and died in less than an hour afterwards.

Constable has painted many excellent pictures, and all his works improve in colour by age; the 'Corn-Field' in the National Gallery is one of his best works, and the 'Valley Farm' in the Vernon Gallery is a very good example of his style. His style is fresh, original, and peculiar, and his scenes are generally extremely simple. His attention was in fact more engrossed by certain minutiae and transient effects in nature than by a love for the picturesque or beautiful of scenery. He carried this attention to minutiae so far as to repeat in many of his pictures the representation of the effect of the morning dew, an effect, however pleasing, extremely transient; and but one, and not the most beautiful, of the ever-varying effects of nature. This effect of dew, of which he was so fond, is a distinctive characteristic of his works, and has caused them to be styled mouldy by some critics, who in the earlier part of his career exercised their functions with little charity towards the painter; but if the 'connoisseurs' of art showed little sympathy for the painter's intense love of nature, he in return was not slow to express his contempt for their commonplace conventionalities. Constable appears indeed to have been very early influenced by his own views of things, for when a young man, being asked by Sir George Beaumont what style he proposed to adopt, he answered, "None but God Almighty's style, Sir George."

Constable's character both as a man and an artist is well described in the following account of him by his friend and fellow-academician, Mr. Uwins, in a paper read at the Pheological Society in 1843:—"He seemed to think that he came into the world to convince mankind that nature is beautiful. Instead of seeking for the materials of poetic landscape in foreign countries amidst temples and classic groves, or in our own amongst castles, lakes, and mountains—he taught that the simple cottage, the village green, the church, the meadow covered with cattle, the canal with its barges, its locks and weedy banks, contained all the materials and called up all the associations necessary for picture. He doted upon his native fields. 'I love,' said he, 'every stile, and stump, and lane in the village: as long as I am able to hold a brush I shall never cease to paint them.'"

(*Memoirs of the Life of John Constable, Esq., R.A.*, composed chiefly of his Letters, by C. R. Leslie, Esq., R.A., 4to, London, 1842.)

CONSTANS, son of Constantine, was at an early age appointed governor of Italy, Africa, and Western Illyricum, and on the division of the empire, these countries were apportioned to him. His elder brother Constantine, being envious of his share, attacked him, but was defeated, and killed near Aquileia, in 340; after which Constans took possession of his brother's dominions, and became emperor of the whole west. Magnentius, commander of the troops in Gaul, having revolted against him, and drawn a great part of Gaul into his party, Constans, who happened to be in that province at the time, was

obliged to take flight towards Spain, when he was pursued and overtaken at the foot of the Pyrenees by some emissaries of Magnentius, and killed, A.D. 350. He is represented by the historians as indolent and rapacious; Zosimus accuses him also of cruelty and other crimes, but Zosimus wrote under the influence of party feeling. The character however of all the three sons of Constantine is open to much censure. Constant protected the Christian faith, as established by the council of Nicea, against the Arians and Donatists, and he also shut up many heathen temples. After the death of Constant, Magnentius took possession of Italy and of Rome, and styled himself Augustus, until he was overthrown by Constantius. [CONSTANTIUS.]

CONSTANT DE REBECQUE, HENRI BENJAMIN, was born at Lausanne, October 25, 1767. Whilst a mere youth his father carried him to England, and placed him at the University of Oxford; he was then sent to a German college, and finished his studies at Edinburgh. There he met with Erskine, Mackintosh, and other young men of liberal opinions, from whom he is supposed to have acquired those principles of political liberty which he retained through life. He was married in 1787 to his first wife, but the union was not auspicious, and he obtained a divorce two years after. Constant returned to France in 1795, after travelling some time in Germany, and the next year his pamphlet, 'On the Strength of the existing Government in France,' was produced. In 1799 the First Consul placed him on the 'Tribunat,' but the independent spirit evinced by the young Swiss in resisting the encroachments of his power displeased Bonaparte, who consequently banished him in 1801. Madame de Staël was ordered to leave the country about the same time. During his exile, Benjamin Constant visited most of the European courts, and in 1808, the authoress of 'Corinne' having refused his hand, he married Mademoiselle de Hardenberg. His famous brochure, 'On the Spirit of Conquest and Usurpation,' appeared in 1813.

In 1814 he returned to Paris, and wrote several pamphlets, in all of which he maintained the fundamental interests of constitutional liberty with that sound judgment and lucid exposition, which formed the leading characteristics of his talent. He also advocated the cause of Louis XVIII. in the 'Journal des Débats' and other newspapers. It was in this journal that appeared, March 19, 1815, his vehement philippic against Napoleon, on the eve of the emperor's return to the Tuileries: "Never will I crawl, like a base deserter, from power to power . . . under Louis XVIII. we enjoy a representative government . . . under Bonaparte we endure a government of Mamelukes. He is an Attila, a Gengis Khan. . . ." But, a few days after this bold denunciation, Constant became a councillor of state under this Attila, and assisted Count Molé in drawing up the Acte Additionnel.

The second fall of Napoleon restored Constant to France, and the department of La Sarthe elected him their deputy in 1819. For the next eleven years, he attached himself to the opposition party in the Chambers; became its leader after the death of General Fay, in 1825, and was considered by many as the greatest debater France had seen since the Revolution. His popularity was almost unrivalled. But for some time previous to the Revolution of July he was observed to droop, and his friends heard him deplore "the too rapid advance of popular feelings." He openly condemned the insurrection of the Three Days. His health was declining fast, and after lingering a few months, he died on the 8th of December 1830, at the age of 63. M. Constant possessed remarkable facility of composition, and a very large number of political brochures proceeded from his pen, as well as various works in general literature, including a drama founded on Schiller's 'Wallenstein.' One of the most ambitious of his later works, was a treatise, 'De la Religion considérée dans sa source, ses formes et ses développements,' 5 vols. 8vo, Paris, 1824-31; and a sort of supplementary publication was his posthumous work, entitled, 'Du Polythéisme romain considéré dans ses rapports avec la philosophie grecque et la religion Chrétienne,' 2 vols. 8vo, Paris, 1838.

CONSTANTINE THE GREAT. [CONSTANTINUS, FLAVIUS VALERIUS.]

CONSTANTINE, POPE, a native of Syria, succeeded Sisinnius in 708. He visited Constantinople and Nicomedia, where he was received with great honour by the Emperor Justinian the younger. After his return to Rome he defended the worship of the images against John, patriarch of Constantinople, and against Philippicus, who had usurped the empire. Felix, archbishop of Ravenna, who had at first refused to acknowledge Constantine, and had been exiled in consequence, made his submission to him, and was reinstated in his see. Constantine died in 714, and was succeeded by Gregory II.

*CONSTANTINE, NIKOLAEVICH, the second of the four sons of the Emperor Nicholas of Russia, who named them after his brothers and himself, so that in two successive generations of the Russian imperial family the four names present themselves in the same order, Alexander, Constantine, Nicholas, Michael. The second Constantine was born on the 21st of September 1827 (new style), and was declared admiral of the fleet by his father in 1831, when he was four years old. As he grew up he manifested an ardent attachment to the profession to which he had been thus early devoted. His chief instructor was Captain, afterwards Admiral Lütke, a man of science as well as a seaman, who had become celebrated by his voyage from Cronstadt to Kamchatka and back in 1826-27, in the course of which he discovered several new islands. Under his guidance his pupil became minutely

BIOC. DIV. VOL. II.

acquainted with all the technicalities of the profession, and stories were current in Russia of disputes between them, in which Lütke had opposed the caprices of the young prince with the manly freedom which we are accustomed to regard as characteristic of a sailor. Whatever truth there may have been in these reports, it is certain that their manner towards each other when they were on a visit to England in 1847, was such as to convey the notion that in familiar phrase they "got on very well together." Constantine in his boyish studies displayed a marked predilection for everything Russian, and also for the study of the oriental languages, of one of which, Turkish, he made himself completely master. These circumstances, and his general reputation for quickness and talent, earned him a wide popularity in Russia, especially with the old Russian or anti-foreign party, to the disadvantage of his elder brother, Alexander, who was looked upon as comparatively dull and spiritless. An idea appeared to gain ground in Russian society, that as in one generation a Constantine had broken the law of succession by vacating the imperial throne, in another a Constantine would do so by mounting it. Stories were current such as we find recorded in Schnitzler, that once when Alexander remarked that the task of governing a nation was burdensome, his brother instantly rejoined, "If that weighs heavy on you, only speak the word, and I will relieve you of the burden." On one occasion Constantine put his brother under arrest for a breach of discipline, in coming aboard his, the Admiral's, vessel without having obtained his leave, and the Emperor, who was seriously offended at the proceeding, was not reconciled to Constantine till in return he had made him suffer an arrest of considerable length. In 1845 Constantine paid a visit to Constantinople, being the first prince of the Russian imperial family who had done so. The embarrassing visitor was received by Abd-ul-Mejid with every show of welcome, though the way in which he was met by the Greeks evinced that they had not forgotten the old prophecy, that the city which had been lost to the Turks under one Constantine, should be won from the Turks under another. In 1847 he assumed the command of the 'Ingermannland,' a ship of the line which had been launched at Archangel under his own direction, to make a cruise in the Mediterranean for the purpose of visiting his mother, the empress, then an invalid at Palermo. On this occasion he paid a flying visit to England, and went over many of the public establishments, signing himself at the model-room at Somerset House "post-captain in the Russian navy." He left a favourable impression on almost all with whom he came in contact. His appearance was more that of a vivacious German student than of a Russian prince, to which his practice of wearing spectacles contributed. He speaks French and English with perfect fluency, having like the rest of the imperial family, acquired the latter language from Dr. Law, the English chaplain at St. Petersburg. He was soon afterwards received with great distinction at Algiers by the Duc d'Aumale, at that time in command of Algeria, and after paying a visit to Naples and Rome, he left his ship and returned home through Germany. On his way he was betrothed to the Princess Alexandra of Saxe-Altenburg, to whom he was married the next year, and by whom he has three children, a son and two daughters. In the dispute between Russia and the western powers which led to the war of 1854-56, Constantine was throughout considered to be on the warlike side, and the great support of the old Russian party. He was entrusted with the command of the defensive measures against the French and English in the Baltic, in conjunction with his inseparable companion, Admiral Lütke. It can hardly be said that the high expectations entertained of his abilities by his countrymen have been realised. If the English navy has suffered some loss of credit from not having gained any signal victory, the Russian navy can hardly be considered to have come with honour from a contest, in which all its efforts have been directed to avoid the hazard of a battle. So remarkably timid a line of policy was in striking contrast with the reputation which the prince had long enjoyed for spirit. On the other hand his humanity to the prisoners and other good qualities are highly spoken of in Lieutenant Royer's 'English Prisoners in Russia.' The death of the Emperor Nicholas led to no collision between his sons, as had long been anticipated, both in and out of the empire, and to all appearance, Constantine has hitherto been the most submissive as well as the first of his brother's subjects.

CONSTANTINE PAVLOVICH, the second son of the Emperor Paul of Russia, and the brother of two other emperors, was born at St. Petersburg on the 8th of May (new style) 1779. The baptismal name of Constantine was bestowed on him at the desire of his grandmother the reigning empress Catharine, and was generally considered to indicate her wish that this grandson would accomplish the prophecy current among the Greeks, that a Constantine should once more reign at Constantinople. Greeks were placed about him from the cradle to interest him in their native language; but the child took a disgust to it from the very outset. As he grew up his favourite study was military exercises and manoeuvres, and he showed many signs of obstinate and eccentric character like that of his father, then the Grand-duke Paul, to whom he also bore a striking resemblance in features, which were the reverse of beautiful. At the age of seventeen he was united to a lady of fifteen, the Princess Juliana of Saxe-Coburg, sister of the present Duchess of Kent. The marriage, which took place in 1796, the year of Catharine's death, did not turn

out happily; four years afterwards the parties separated by mutual consent. In 1799 Constantine took part in the campaign of Suworov in Italy, and displayed a daring bravery, but no great talents for command. On the death of his father the Emperor Paul he was eager for revenge, and was only persuaded to be quiet by his respect for his brother Alexander, which was carried to an extent altogether remarkable in so wild and wayward a character, and even exposed him at times to the charge of servility. He earned his proudest military laurels on the field of Austerlitz in 1805, where, at the head of the reserve composed of ten battalions and eighteen squadrons of the guard, he withstood with fiery energy the charge of Bernadotte, and when victory was impossible, retreated in good order. In all the subsequent phases of the contest against Napoleon which terminated so triumphantly for Russia, he maintained the reputation of a brave and hardy soldier. At its close when Alexander succeeded, in spite of a formidable diplomatic opposition in establishing a kingdom of Poland under Russian sway, Constantine was named the commander-in-chief of the Polish troops, or generalissimo of Poland. No appointment could have been more unfortunate if it was intended to carry out in good faith the constitution which had been promised and guaranteed to the new kingdom. The generalissimo's antipathy to the constitution was however not so extreme as to induce him to refuse a voice in the chambers, when he was very unexpectedly elected deputy for Praga, the suburb of Warsaw, whose destruction by Suworov forms one of the most frightful pages in Polish history. He took his seat, and even affected to oppose on some occasions the measures of the government on local questions; but this was, as might be expected, only an ebullition of wayward humour, and he withdrew when the increasing majorities of the chambers against the government showed that soon one or the other must give way. In fact the generalissimo, who was brother of the emperor, had a greater influence in the government of Poland than the nominal Viceroy Zajączek, an old soldier of Napoleon's, and it was his management of the army, which he brought into excellent discipline, but with a sternness and severity that revolted the feelings of the officers, which gave rise to much of the discontent that prevailed in Poland. In 1820 the crisis came, and Alexander, incensed at the manner in which the Poles availed themselves of their constitution, dissolved the chambers.

In the same year the charms of a Polish lady led Constantine to a step which changed his own destiny and perhaps that of Russia. The Countess Joanna Grudzyńska was a fragile beauty, in delicate health, who seemed little likely to win the regard of a rough and boisterous soldier. Constantine saw her, and became so fascinated that he determined to overcome every obstacle that lay in the way of making her his wife. A decree of the Holy Synod of the Greek Church confirmed an imperial ukase, by which the emperor's brother was, on the 1st of April 1820, divorced from the Princess of Saxe-Coburg, with liberty to marry again. By a decree of the same date, the Emperor Alexander ordained however that only the issue of marriages in the imperial family which were sanctioned by the reigning emperor should enjoy the right of succession to the throne. It was known therefore, when in the course of May the marriage of the grand-duke to the countess took place, that their children would not belong to the imperial family; but the rights of the grand-duke himself were supposed to remain intact, and he was then the presumptive heir to the czar. Nothing was known to the contrary till the unexpected death of Alexander at Taganrog, on the 1st of December 1825. When the news reached St. Petersburg the Grand-Duke Nicholas called together the Council of the Empire to take the oath to the Emperor Constantine, who was then absent at Warsaw, where from generalissimo he had become viceroy of Poland. The council produced a packet deposited with them, on which was written, in the Emperor Alexander's hand, that in the event of his death it was to be opened before proceeding to any other business; and the seal was solemnly broken. A letter from Constantine to his brother was found within, dated in January 1822: "Conscious," so ran the letter, "that I do not possess the genius, the talents, or the strength necessary to qualify me for the dignity of sovereign, to which my birth would give me a right, I entreat your imperial Majesty to transfer that right to him to whom it belongs after me, and thus ensure the stability of the empire. By this renunciation I shall add a new force to the engagement which I spontaneously and solemnly contracted on the occasion of my divorce from my first wife." There was a reply by Alexander to this communication, simply, without a word of comment, accepting the offer it conveyed; and, finally, a declaration that in pursuance of it the Grand-Duke Nicholas was to ascend the throne of Russia. Copies of these documents had been deposited with the Synod and other bodies, yet Nicholas appeared to have been till then unacquainted with their existence. Nicholas declined to accept the crown, and sent his brother Michael to urge Constantine to resume his birthright; but at Dorpat Michael met a messenger from Warsaw conveying Constantine's unalterable persistence in his resolution, and turned back in haste to St. Petersburg. It was indeed time to put an end to the interregnum, which had now lasted more than twenty days. A republican conspiracy had for some time been spreading among the officers of the Russian army; the discovery of its ramifications had saddened the last days of the Emperor Alexander. The ringleaders determined to

avail themselves of the uncertainty of the succession to excite confusion.

When Nicholas finally ordered the oath to be taken to himself as emperor, they spread a report that he was defrauding his brother of his rights, and that Constantine was on the march from Warsaw to defeat his insidious designs. Growing bolder as they met with some success, they raised the cry of "Long live Constantine and Constitution!" and it is said that the private soldiers who joined it imagined that the word 'constitution,' which is a foreign word in Russian, and has a feminine termination, was the name of Constantine's wife the Polish countess. The formidable revolt which grew from the refusal of the regiments to take the oath to Nicholas, in consequence of these false representations, was crushed by the firmness and presence of mind of the new emperor. The coronation of Nicholas was appointed to take place at Moscow, and on the evening before it Nicholas was greeted with the unexpected intelligence that Constantine had come spontaneously to do him honour. The next day saw the remarkable sight of the elder brother walking in the younger brother's coronation procession, and taking the oath of homage—more remarkable still that the difference of age was so great—no less than seventeen years, Nicholas having been born in the year in which Constantine was married.

Constantine returned to Poland from the coronation at Moscow, and from that moment he was more than ever the master at Warsaw. Constantine was perhaps not naturally savage, and his marriage had made him more disposed to be affable, but his good nature could not be counted on for a moment; when reviewing his troops he would often at the sight of some trifle not to his mind, fly into a fit of furious passion, and for the venial offence of an individual, inflict some annoying punishment on a body of 40,000 men. In his eyes, too, no consideration at all was due to those who forgot what he regarded as the duty of unconditional obedience to the sovereign. He was sometimes deliberately cruel himself, and he suffered deliberate cruelties in others to those who had thus put themselves in his opinion beyond the pale of mercy. The proud and spirited Pole, who in their own opinion owed no allegiance at all to the Russian emperor, endured all this remarkably long, but the whole of Poland was ready for a conflagration when the French revolution of 1830 applied the match. It is said that a conspiracy which Constantine fancied he had discovered was fictitious, but on the night of the 29th of November 1830, there could be no doubt that a real insurrection burst out. The palace of the Belvedere near Warsaw, in which he resided, protected by a girle of moats, was entered by a body of insurgents, and he only escaped with his life by the protection of some of his Polish guards. In the course of the next few days he is accused of having committed an imprudence by meeting with the insurgents on terms of equality, but the result was that he was allowed to leave Poland without any serious obstacle. Nicholas rejected peremptorily the terms of the Poles, and in the war which commenced Constantine bore a very insignificant part. He was present at the battle of Grochow, but not in command, and it is said that he could not avoid expressing some satisfaction at the conduct of the Polish army, which had become under his training one of the best disciplined armies of Europe. Soon after he was obliged to withdraw with the troops under him before a division commanded by his brother-in-law the Polish general Chlapowski, and an attack of cholera carried him off at Witepak, on the 27th of June 1831. His wife who had borne for some time the title of Princess of Lowicz, died on the 29th of November in the same year, at the palace of Tsarskoe Selo. His first wife the Princess Juliana, the aunt of Queen Victoria, is still living.

CONSTANTINUS, FLAVIUS VALERIUS, called the Great, the son of Constantius Chlorus, was born in A.D. 274. He was brought up at the court of Diocletian, and served early with the armies in various expeditions. Being in Britain at the time of his father's death, he was proclaimed emperor by the soldiers, but he prudently deferred his nomination to Galerius, who acknowledged him only as Caesar, and governor of the provinces which had long been administered by his father. Constantine passing over into Gaul to oppose the Franks who had entered that province, defeated them as well as the Alemanni. He behaved with great inhumanity to the prisoners, and gave up their chieftains to the wild beasts as a public spectacle. (Eutropius, x.) Meanwhile Maxentius, the son of Maximianus, caused a revolt at Rome while Galerius was absent in the East, and Maximianus himself having come to Rome, resumed the title of emperor, and took Maxentius as his colleague. Severus, whom Galerius ordered to put down this insurrection, was betrayed by his troops, taken prisoner, and put to death by Maximianus. The latter however fearing the vengeance of Galerius, thought of strengthening himself by an alliance with Constantine, whom he went to meet in Gaul, and gave him his daughter Fausta in marriage. From that time Constantine was acknowledged as Emperor by the West. Soon after Maximianus having quarrelled with his son Maxentius, left Rome for Pannonia, where he met Galerius and Diocletian, who had left his retirement of Salona for the purpose of appointing Licinius a new Caesar, in the room of Severus. There were then in the empire no less than six emperors and Caesars, namely, Maximianus, Maxentius, Galerius, Constantine, Maximinus, and Licinius. Galerius soon after acknowledged both Constantine and Maximinus, as emperors and

Augusti equal to himself. Maxentius continuing to maintain himself at Rome, Maximianus visited his son-in-law Constantine, whom he attempted to dispossess of his authority by exciting his soldiers to revolt, but he was defeated and taken at Massilia by Constantine, who treated him with great indulgence, and allowed him to remain in his palace. Maximianus having next attempted to murder him in his bed, was seized and put to death. In the year 311 Galerius published an edict to stop the persecution against the Christians; this document bears the name of three emperors, Galerius, Constantine, and Licinius: Maximinus, who was in Asia, is not mentioned in it. Galerius soon after dying at Sardica in Dacia, Licinius took possession of his dominions as far as the Hellespont, and Maximinus had the whole of Asia. Maxentius continued to govern Italy, and was making warlike preparations against the other emperors, when Constantine, in 312, moved with an army from Gaul to attack him. He took Susa, defeated several bodies of troops sent against him by Maxentius, entered Mediolanum (Milan), and then attacked Verona, where Pompeianus, a general of Maxentius, had stationed himself. After an obstinate fight, Pompeianus was defeated and killed, and Constantine marched upon Rome, where he defeated Maxentius in person, a few miles from the capital, on the right bank of the Tiber, near the present Ponte Milvio, where Maxentius had constructed a bridge of boats. In recrossing the bridge in his flight, Maxentius was drowned, with many of the fugitives. Constantine entered Rome on the 29th of October, and was acknowledged emperor by the senate, who ordered the Triumphal Arch which still exists to be raised to him as the liberator of Rome. He is said to have behaved with moderation after his victory, having put to death only a few of the worst ministers of Maxentius, who is represented as a cruel tyrant both by heathen and Christian historians.

It was on this occasion that Constantine adopted a new ensign for his army, which was called *Labarum* or *Laborum*; it had the figure of a cross, with the Greek letter Γ above it, and the Greek words $\epsilon\upsilon\tau\eta\epsilon\upsilon\sigma\alpha\iota$, 'conquer in this.' Eusebius, who gives a description of it, asserts with other Christian historians, that it was assumed in consequence of a vision which Constantine had before his battle with Maxentius. Gregorius Nazianzenus says, that the name of *Laborum* was used as indicating that by the assistance of this new sign all 'labours' and tribulations of the empire should cease. Zosimus, Aurelius Victor, and Eutropius, say nothing of it. Much has been written on this subject. (See Gretzer, 'De Cruce;' and 'Dissertation sur la Vision de Constantin,' par J. B. Devoisier, bishop of Nantes.)

In the year 313 Licinius came to Rome, when both he and Constantine were named consuls, and he married Constantia, the sister of Constantine. The old emperor Diocletian died in July of that year at Salona.

A war having broken out in the East between Licinius and Maximinus, the latter was defeated, and died of poison at Tarsus: all his family were put to death by Licinius. The whole empire was now divided between Constantine, who ruled over the West, including Italy and Africa; and Licinius, who had the eastern provinces, with Egypt.

Constantine now openly favoured the Christian communion, and discontenanced and ridiculed the practices of the old religion of Rome. He exempted the Christian clergy from personal taxes and from civil duties, and granted donations and privileges to the churches. He ordered a council of the bishops of the West to assemble at Arles to settle the schism of the Donatists, and went himself to Arles; but while there he received news of the hostile intentions of Licinius, which made him march in haste at the head of an army into Illyricum. The two armies met near Sirmium in Pannonia, and again in the plains of Thraee, after which Licinius sued for and obtained peace, by giving up to Constantine Illyricum, Macedonia, and Greece. On visiting these new provinces, Constantine promulgated several laws, by which he abolished the punishment of the cross; ordered that the children of destitute parents should be maintained at the public expense; and allowed the emancipation of slaves to be effected in the Christian churches in presence of the clergy without any interference of the civil magistrate. By another law, promulgated at Sardica in December 316, he gave to the vicars or governors of the provinces full power to try persons of every rank accused of oppressions and robbery, without any appeal to Rome, by which he put a check on the overbearing insolence of the rich towards the poor. In the year 318, Crispus, son of Constantine by his first wife, obtained the consulship with the younger Licinius, the son of Licinius. Constantine spent several years in visiting the provinces of the empire, and promulgating new laws, which were conceived for the most part in a humane and liberal spirit: he abolished the punishment of flagellation formerly inflicted on defaulters in the payment of taxes, introduced a better discipline into the prisons, repealed the old laws against celibacy, and forbade concubinage, which was then allowed by the Roman laws. He also prohibited nocturnal assemblies, and certain obscene rites of Paganism; but he did not attempt to forbid the exercise of the old religion.

By an edict of March 321, he ordered the observance of the Sunday, and abstinence from work on that day. In the year 322 he defeated the Sarmatians and the Getæ or Goths, and repulsed them beyond the Danube. On returning to Thessalonica, where he was constructing a harbour, the Goths appeared again, and invaded Moesia and Thraee. Constantine again attacked them, and pursued them into the terri-

ories of Licinius. This was made the pretence of a new war between the two emperors, in which Licinius being defeated near Chalcedon, by sea and by land, escaped to Nicomedia, and there surrendered to Constantine, who, at the intercession of his sister Constantia, promised him his life, and sent him to Thessalonica, where however he was soon after (324) put to death. Licinius has been spoken very unfavourably of by most historians. Constantine, being now master of the whole empire, extended to the east his laws in favour of the Christian religion. He forbade consulting the haruspices and the oracles; ordered the churches of the Christians which had been demolished under Maximinus and Licinius to be rebuilt, and the property of the church to be restored, and more especially the burial-grounds of the Martyrs; and reinstated in their rank and right all those who had been prosecuted or exiled on account of their religion. In writing to the Metropolitans he styled them 'well-beloved brethren.' He published a Latin edict, which was turned into Greek by Eusebius, addressed to all the subjects of the empire, in which he exhorted them to renounce their old superstitions, and to adore only one God, the Saviour of the Christians. In 325 he assembled the first universal council of Nicea, which he attended in person. [ARIUS.] On the 25th of July of that year, being the anniversary of his accession to the empire, he gave a great entertainment to all the fathers of the council, to whom he gave considerable gifts and sums to distribute to the poor. From Nicomedia, where he resided for some time, he issued an edict inviting all the subjects of the empire to address their complaints to him in person against any abuse of authority of the governors and magistrates. By another edict he abolished the fights of gladiators, and ordered that the convicts, who were formerly compelled to fight against them or against the wild beasts, should be employed in working the mines. These facts show a great alteration in Constantine's mind from the time when he himself gave up the Frankish prisoners to the wild beasts in the amphitheatre.

In the year 326 he repaired to Milan, and then to Rome, being consul, for the seventh time, with his son Constantius; he remained at Rome but a short time, and left it in disgust, never to return to it. According to Zosimus and Libanius, the Romans were dissatisfied with him for having forsaken the old religion, and expressed their discontent by biting satires. By the end of the year we find Constantine at Sirmium, in Pannonia. In this same year is recorded the tragical death of Crispus, the eldest son of Constantine, by a former wife or concubine; a young man who had been educated by Lactantius, who had been praised by Eusebius, and who had given proofs of his courage and abilities on many occasions. He was falsely accused by his step-mother, Fausta, of having endeavoured to seduce her, some say of having aspired to the sovereign power, and upon one or other of these charges his father had him beheaded. At the same time he put to death young Licinius, his sister's son, who was charged apparently with being concerned with Crispus in his alleged treason. But it was soon after discovered, some say through Helena, the mother of Constantine, that the young prince was innocent, and that Fausta herself had been repeatedly guilty of adultery, upon which she also was put to death with several of her accomplices. Constantine's suspicious temper added to the number of the victims.

About the year 328 Constantine began to build his new capital, which was called by his name, and the spot was judiciously chosen. It was a Christian city, chiefly inhabited by Christians, and no heathen temples were built in it. In May 330 the new town was solemnly dedicated to the Virgin Mary. Meantime the emperor was repeatedly engaged against the Goths and other barbarians on the banks of the Danube. In the year 328 he recalled several Arian bishops, Eusebius of Nicomedia among others, who had been exiled by the council of Nicea. This change is said to have happened at the suggestion of Constantia, who was herself in the Arian communion, and retained to the last much influence over her brother Constantine. Athanasius having opposed the re-admission of the Arians into the church communion, a long controversy ensued between him and the emperor, which lasted till the death of the latter. [ATHANASIUS.] Constantine was fond of religious polemics, and himself wrote on the Arian and Donatist controversy. The remaining years of Constantine's life were chiefly spent in embellishing his new capital and attracting inhabitants, especially Christians, to it; the rich by privileges, the working men by daily distributions of corn and oil. He made a division of the empire, to take effect after his death, among his three sons, whom he had named Cæsars: giving to Constantine, the eldest, the Gauls, Spain, and Britain; to Constans, Illyricum, Italy, and Africa; and the East to Constantius. To Dalmatia, one of his nephews, he gave Macedonia and Achaia, and the other, Annibalius, he made king of Pontus and Cappadocia. He likewise divided the authority of the prefect of the prætorium among four præfects—of the East, of Macedonia and Dacia, of the Gauls, and of Italy. These four great governments were subdivided into provinces, administered by vicars or pro-præfects. He took away from the præfects all military power, constituting them merely as civil and political officers. He is charged by Zosimus, who is strongly biassed against Constantine, with having effected another change which proved fatal to the empire, namely, the removal of the military stations on the frontiers, and the placing of the soldiers in garrison in the towns of the interior; but perhaps this was only on some particular points, where the barbarians had

encroached and were likely to cut off the old border stations. We find that he gave lands in Thracia and other provinces south of the Danube to the Sarmatians, who had been driven from their country by the Goths. Constantine probably thought of making one race of barbarians a rampart to the empire against the other. In the year 337, when preparing to march against the Persians, who had commenced hostilities, he fell ill at Nicomedia, and died there, in his sixty-fourth year. He is said to have received baptism on his death-bed from an Arian bishop; for although long converted to Christianity he was still only a catechumen, as was frequently the case with converts in that age. His body was transferred to Constantinople, where it was buried, after a sumptuous funeral. The senate of Rome placed him among the gods, and the Christians of the East reckoned him among the saints: his festival is still celebrated by the Greek, Coptic, and Russian churches on the 21st of May.

The character of Constantine has been the object of various and contradictory judgments, according to the religious and political spirit of the various writers. Eusebius, Nazarius, and other Christian contemporaries, grateful for the protection afforded by the emperor to the Christian religion, may be considered his panegyrist, while Zosimus and other heathen writers, animated by an opposite feeling, were his enemies. The brief summing-up of Eutropius is perhaps nearest the truth. "In the first part of his reign he was equal to the best princes, in the latter to middling ones. He had many great qualities; he was fond of military glory, and was successful. He was also favourable to civil arts and liberal studies; fond of being loved and praised, and liberal to most of his friends. He made many laws; some good and equitable, others superfluous, and some harsh and severe." He has been blamed for dividing the empire, but that had been done already by Diocletian; in fact it was too large and straggling to remain in the possession of a single dynasty. By founding another capital in the East he probably did not accelerate the fall of the West, while at the same time he established a second empire, which lasted for more than a thousand years after his death.

(Eusebius, *Life of Constantine*; Zosimus; Aurelius Victor; Eutropius, and other numerous writers, a list of whom is given by J. Vogt; *Historia Litteraria Constantini Magni*, 1720.)

Coin of Constantine the Great.

British Museum. Actual size. Gold. Weight 70 grains.

CONSTANTIUS I., called CHLORUS, on account of his habitual paleness, son of Eutropius, of a distinguished Illyrian family, and of Claudia, niece of the Emperor Claudius II., was born about 260. He served with distinction under Aurelian, Probus, and Diocletian. In the year 291 Maximianus, the colleague of Diocletian, named him Cæsar and his colleague, while Diocletian chose on his side Galerius: the administration of the empire was divided among the four. Constantius had for his share the Gauls, Spain, and Britain. Both the new Cæsars were obliged to repudiate their wives. Constantius, whose first wife was Helena, the mother of Constantine, married Theodora, daughter of Maximianus; Galerius married Valeria, daughter of Diocletian. Constantius carried on war against the Franks, who began to be troublesome on the Lower Rhine, and took a vast number of them prisoners. He restored the town of Augustodunum (Autun), which had been devastated by Tetricus, one of the thirty tyrants. He then repaired to Britain, with Asclepiodotus, one of his lieutenants, who defeated Allectus (300), the successor of Carausius in the usurped dominion of the island. Britain was thus restored to the empire after a revolt of ten years. On his return to Gaul, Constantius went against the Alemanni, whom he defeated with great slaughter near Vindonissa in Helvetia, some say near Langres, and drove them beyond the Rhine. About this time he founded the town of Constantia (Constance). In the year 304 the two emperors, with the two Cæsars, came to Rome, where they enjoyed the honour of a triumph. In the following year Diocletian and Maximianus abdicated, and appointed Constantius and Galerius their successors, who in their turn appointed two new Cæsars as their colleagues, namely, Severus and Maximinus Daza. Constantius continued to administer his old government of Gaul, Spain, and Britain. His administration, which was equitable and humane, is greatly praised by the historians, both Christian and heathen. He put a stop to the persecutions against the Christians, and employed many of them about his person. The last campaign of Constantius was against the Caledonians, some say against the Picts, whom he defeated. He died soon after at Eboracum (York), July 25, 306, in the arms of his son Constantine, whom he appointed his successor, 306. By his second wife Theodora, Constantius left several children—Dalmatius; Julius Constantius, who was the father of Constantius Gallus and of Julian the Apostate; and Constantia, afterwards married to Licinius.

CONSTANTIUS II. (FLAVIUS JULIUS), son of Constantine the

Great, was left by his father's will Emperor of the East. The troops however, in order to secure the empire to the three sons of Constantine, killed Julius Constantius, half-brother of the late emperor, Dalmatius and Annibalianus, his nephews, and other of his relatives, with several patricians and ministers. This massacre was allowed by Constantius, and some say was ordered by him; only two nephews of Constantine escaped, Gallus and Julianus, afterwards emperor. Constantius was repeatedly engaged in war against the Persians and the Armenians, but with little success on his part. Ammianus Marcellinus, in speaking of these wars, says that the Romans were successful when led by the emperor's lieutenants, but were generally losers when led by the emperor in person. After the death of Constantine in 350, Constantius marched with a large force against Magnentius to revenge his brother's death, and at the same time to take possession of his dominions. A desperate battle was fought in 351 near Mursa, on the banks of the Drave, and at last the cavalry of Constantius gained the victory. Magnentius escaped into Italy, but Constantius was too much weakened by his victory to follow him until the next year, when he entered Italy, defeated Magnentius again, and compelled him to escape into Gaul. In the year after, 353, Constantius again defeated Magnentius in Gaul. The usurper, finding himself forsaken by his soldiers, killed himself; and his brother Decentius, whom he had made Cæsar, followed his example. Constantius now became master of the West as well as of the East, and thus reunited the whole empire under his dominion. He had appointed his cousin Gallus Cæsar and governor of the East, when he set out to oppose Magnentius. In the same year, 353, Constantius assembled a council at Arles, which was composed of Arian bishops. The emperor favoured that sect, and persecuted the orthodox or Nicæans, and exiled many of their bishops, among others Liberius, bishop of Rome. In the year 354, Constantius, having received repeated complaints of the cruelties and oppressions committed by Gallus in the East, sent for him, and caused him to be beheaded in Dalmatia. Several conspiracies were also discovered or invented by the courtiers of Constantius, and numerous persons tortured and put to death. Meantime the Franks and the Alemanni had passed the Rhine, and destroyed Colonia (Cologne) and other towns; the Quadi and the Sarmatians were ravaging Pannonia, and the Persians attacked the eastern provinces. It was in this emergency that Constantius, being at Milan in November 355, proclaimed his cousin Julian Cæsar, gave him his sister Helena in marriage, and sent him as commander to the Gauls. In the following year Constantius issued laws forbidding under pain of death any sacrifice to idols, and condemning to death all magicians, astrologers, and soothsayers. In 357 the emperor repaired to Rome for the first time, and was received with great pomp by the senate, and public festivals and games were celebrated in his honour. He caused the obelisk which Constantine had removed from Heliopolis to Alexandria to be carried to Rome, where it was raised in the Circus Maximus: it was now called the Lateran Obelisk. Constantius having returned to the East, defeated the Sarmatians, while Julian conquered the Germans on the Rhine. He then marched against the Persians, but was unsuccessful. In the meantime Julian had been proclaimed emperor by the soldiers at Paris. Constantius was making preparations to attack him when he was taken ill at Tarsus, and died there in November 361. On his death-bed he named Julian his successor. Constantius, though not a good prince, had yet some valuable qualities. He was cautious and discriminating in the appointment of his great officers; he took care of the soldiers; he bestowed office generally on the most deserving; was fond of science and application; was temperate, sober, slept little, and his habits were regular. But he was suspicious, and cruel in consequence of his suspicions. He oppressed the people with taxes, and spent much money in pomp, parade, and useless building. (Ammianus, b. xiv.)

CONTARINI, an illustrious family of Venice, which has given to the republic many senators, doges, and statesmen. The first doge of the name was Domenico Contarini, in the 11th century; another, Andrea Contarini, was doge during the war of Chiozza. After the Genoese had taken that place, and were threatening the very existence of Venice, in 1380, Contarini, then eighty years of age, led the Venetian fleet against the enemy; and being assisted by Vettor Pisani and Carlo Zeno, he defeated the Genoese, retook Chiozza, and thus saved the republic. Ambrogio Contarini was sent, in 1473, by the republic, then at war with Mahomet II., as ambassador to Hussum Hassan Bey, sovereign or usurper of Persia, to contract an offensive alliance against the Ottomans. The coasts of Asia Minor and Syria being occupied by the Turks, Contarini was obliged to take his way through Poland and Tartary to Caffa in the Crimea, from whence he crossed the Euxine to the mouth of the Phasis, and thence proceeded through Mingrelia and Armenia to Persia. He met Hussum Hassan at Isfahan, accompanied him to Tabreez, and then returned homewards by Derbent and the Caspian Sea to Astrakhan, and thence to Moscow, where he was well received by the grand-duke of Muscovy. He returned to Venice in 1477, and published the journal of his mission, which is curious, and written with much apparent regard to truth. 'Itinerario nell' Anno 1473, ad Usam Cassan Ré di Persia,' 4to, Venezia, 1524. Hussum Hassan attacked Mahomet, while the Venetian fleet was ravaging the coasts of Asia Minor; but the Persians were defeated by the Turks near Trebizond, and the alliance led to no other result than to effect a temporary diversion in favour of Venice.

There have been likewise several men of learning of the family of Contarini, such as Cardinal Gaspare Contarini, in the 16th century, who was employed on several important missions, and wrote many philosophical and theological works; among others, 'De Immortalitate Animæ adversus Petrum Pomponacium,' 'De Libero Arbitrio et Prædestinatione,' and also a treatise, 'De Magistratibus et Republica Venetorum.' His works were collected and published together at Paris, folio, 1571. Vincenzo Contarini was professor at Padua at the beginning of the 17th century. He wrote several works on classical erudition; 'De re frumentaria,' 'De Militari Romanorum Stipendio,' and 'Variarum Lectionum Liber.'

*CONYBEARE, VERY REV. WILLIAM DANIEL, Dean of Llandaff, was born at his father's rectory, St. Botolph's, Bishopsgate, 7th of June 1787. He entered Christchurch College, Oxford, in January 1805, and took his degrees B.A. in 1808, and M.A. in 1811. Mr. Conybeare was one of the earliest promoters of the Geological Society, and the important services he has rendered to geological science may be seen in his numerous papers printed in the Society's 'Transactions.' He is the discoverer of the Plesiosaurus, that strangest of all the antediluvian monsters, and for his descriptions of the animal Cuvier paid him the highest compliment that can be offered by one scientific philosopher to another. His papers on the coal-fields, giving a description of the physical geography of important districts, establishing the relations of some of the most remarkable British rocks, and their order of superposition, have ever since furnished data for practical purposes, and shown how the absurd mistakes of mining speculators were to be avoided. As will be seen from the subjoined titles, his researches have extended to various branches of inquiry. His first paper presented to the Geological Society is 'On the Origin of a remarkable class of Organic Impressions occurring in Nodules of Flint,' vol. ii., 1814; 'Descriptive Notes referring to the Outline of Sections presented by a part of the Coasts of Antrim and Derry,' vol. iii., 1816, made in a tour conjointly with the Rev. Dr. Buckland, Dean of Westminster; 'Notice of the Discovery of a New Fossil Animal, forming a link between the Ichthyosaurus and Crocodile,' &c., vol. v., 1821. In vol. i., new series, 1824, further notices are given, and 'On the discovery of an almost perfect Skeleton of the Plesiosaurus,' and the same volume contains 'Observations on the South-western Coal District of England,' written jointly with the Dean of Westminster; 'Extraordinary Landslip and great convulsion of the Coast near Axmouth,' Jameson's 'Edin. Journal,' 1840; 'On the Phenomena of Geology which seem to bear most directly on Theoretical speculations,' 'Phil. Mag.,' vols. viii. and ix., second series; 'On the Structure and Extent of the South-Welsh Coal Basin,' &c. vol. xi.; 'Outlines of the Geology of England and Wales; with an introductory Compendium of the general principles of that Science,' &c., 8vo, London, 1822 (jointly with W. Phillips). He also drew up the 'Report on the Progress, actual state, and ulterior prospects of Geological Science,' published in the first volume of the 'Reports of the British Association.'

Mr. Conybeare was elected a fellow of the Royal Society in 1819. He is a fellow of the Geological Society, and corresponding member of the Institute of France. He became Dean of Llandaff in 1845, having previously been public preacher in his own university, and Hampton lecturer in 1839.

COOK, CAPTAIN JAMES, was the son of an agricultural labourer and farm-bailiff, resident at Marton in Yorkshire, six miles from Stockton-upon-Tees, and was born October 27, 1728. At an early age he was apprenticed to a haberdasher at the fishing-town of Staithes, near Whitby. Here his genius soon showed its true bent; and having procured a discharge from his master, he apprenticed himself to a firm engaged in the coal trade at Whitby, in whose service he continued, rising gradually, till he attained the situation of mate. Being in the Thames in 1755, when men were greatly sought after, he resolved to take his chance as a volunteer in the royal navy. He was soon distinguished as a skilful and trustworthy seaman; and such effectual interest, backed by the favourable testimony of Captain (afterwards Sir) Hugh Palliser, was made in his behalf at the Admiralty by some Yorkshire gentlemen, that in May 1759 he was appointed master, first of the 'Grampus' sloop, and afterwards of the 'Mercury,' in which he was present at the siege and capture of Quebec by Wolfe. He gave eminent proofs of skill and resolution, in taking soundings of the river opposite to the French fortified camp, preparatory to an attack thereon, a difficult and dangerous service, which he performed so well that he was afterwards employed to lay down a chart of the river from Quebec to the sea. This chart was published, and for a long time was the only one in use.

In the same autumn he was promoted to be master of the 'Northumberland' man-of-war, in which he served till 1762, when the ship returned to England. During the winter of 1759-60, which he passed at Halifax in Nova Scotia, he employed the leisure which the season gave him in beginning the study of mathematics, with a view to qualify himself for the higher departments of his profession. In 1763 he went out to survey the Newfoundland Islands; and in 1764, on the appointment of Sir Hugh Palliser to be governor, Cook was appointed marine surveyor of Newfoundland and Labrador. The fruit of his labours during the four years in which he held that office was embodied in his valuable charts of those countries.

The credit which he acquired in the discharge of his functions at Newfoundland, was the cause of his selection, in 1767, as a fit person to conduct a voyage undertaken into the South Pacific Ocean, for astronomical and geographical purposes. On this occasion Mr. Cook was promoted to the rank of lieutenant. For an account of the origin and objects of this undertaking, and the course of the voyagers as far as Otaheite, we refer to the article BANKS, SIR JOSEPH. The transit of Venus having been satisfactorily observed on the 3rd of June, Cook resumed his voyage July 13, 1769, and after cruising for a month among the other Society Islands, sailed southward in quest of the unknown continent, *Terra Australis Incognita*, which was formerly supposed to exist somewhere, as a counterpoise to the great mass of land in the northern hemisphere. Lofty mountains were seen October 6th, and it was supposed that the object of their search was found. The land however proved to be New Zealand, which had not been visited by Europeans since it was discovered by Tasman in 1642. Cook spent six months in sailing round it, and found it to consist of two large islands, divided by a narrow channel. The warlike and savage temper of the natives hindered him from doing much to explore the interior. Sailing westward, he reached New Holland, or, as it is now called, Australia, April 19, 1770, and ran down its eastern side from lat. 33° to its northern extremity at Torres Strait, lat. 10½°, where he took possession of the coast which he had explored in the name of Great Britain, and denominated it New South Wales. He then shaped his course towards New Guinea, and by passing between them proved what had been disputed, that Australia and New Guinea were distinct islands. Of the various interesting adventures and narrow escapes which occurred to the navigators during their long sojourn among savage tribes and unknown seas, especially that difficult and tedious navigation of near 2000 miles along one of the most dangerous coasts in the world, we have no room to speak. Cook continued his voyage by Timor and the south coast of Java to Batavia (Oct. 9), where he was compelled to stay two months and a half to repair the ship, which had received most dangerous injuries among the coral-reefs of New South Wales. The pestilential climate of Batavia proved very fatal to the ship's crew, already weakened by the hardships of their long voyage. Seven died at Batavia, and twenty-three more on the voyage to the Cape of Good Hope. The 'Endeavour' anchored in the Downs on the 12th of June 1771.

Shortly after his return Cook was promoted to the rank of commander. His journal and the papers of Mr. Banks were entrusted to Dr. Hawkesworth, who from these documents, and the materials of Captains Byron, Wallis, and Carteret, published an account of the several voyages of discovery undertaken during the reign of George III. into the Pacific, illustrated with plates and charts at the expense of government.

This voyage proved that neither New Zealand nor Australia was part of the supposed southern continent; and also that no such continent could exist to the northward of 40° S. lat. It was now determined to send out a second expedition under Cook to explore the higher latitudes; and the 'Resolution,' of 460 tons, and a smaller ship, the 'Adventure,' Captain Furneaux—which parted company in the second year of the voyage—were commissioned for this purpose. Cook was instructed to circumnavigate the globe in high southern latitudes, prosecuting his discoveries as near the South Pole as possible, and making such traverses from time to time into every corner of the Pacific Ocean not before examined, as might finally and effectually resolve the much agitated question about the existence of a southern continent in any part of the southern hemisphere to which access could be had by the efforts of the boldest and most skilful navigator.

The two ships sailed from Plymouth July 13, 1772, quitted the Cape of Good Hope November 22nd, and traversed the Southern Ocean in high latitudes during near four months, between the limits of 20° and 170° E. long., the extreme point to the southward being lat. 57° 15'. Having satisfied himself that no land of great extent could exist between these limits, Captain Cook made sail for New Zealand, which he reached March 26, 1773. After spending the winter months (our summer) among the Society Islands, he resumed his quest of the southern continent in November, proceeding eastward, principally between the 60th and 70th parallels of latitude, and from 170° E. long. to 106° 54' W. long., where he reached his extreme southing, lat. 71° 10', being there finally stopped by the ice. Returning northward, during the winter months he traversed the Pacific Ocean in the southern tropic, from Easter Island to the New Hebrides, and discovered another island, the largest in the Pacific except New Zealand, which he called New Caledonia. Thence he returned to New Zealand to refresh the crew, and resumed his quest of a southern continent November 10. Having sailed in different latitudes between 43° and 56° till the 27th, when he was in 138° 56' W. long., he gave up all hope of finding any more land in this ocean, and determined to steer direct for the western entrance of the Strait of Magalhaens, with a view of coasting the south side of Tierra del Fuego, which at that time was very imperfectly known. He passed Cape Horn December 29, and standing southward, discovered Sandwich Land, a desolate coast, the extreme point of which, in lat. 59° 13' W. long. about 22°, was named by him the Southern Thule, as being the most southern land which had been then discovered. Thence he ran to the eastward, nearly to the longitude of the Cape of Good Hope, and having thus

encompassed the globe in a high latitude, and satisfied himself that no land of considerable magnitude could exist between the 50th and 70th parallels, he thought it inexpedient to prosecute his discoveries in those tempestuous seas with a worn ship and nearly exhausted provisions. Accordingly he made sail for the Cape, which he reached March 22, 1774, having sailed no less than 20,000 leagues since he left it, without meeting even with so trifling an accident as the loss of a mast or yard. On the 30th of July he anchored at Spithead.

He was immediately raised to the rank of post-captain, and received a more substantial reward for his services in being appointed a captain of Greenwich Hospital. Men of science were powerfully interested, not only by his geographical discoveries but by his unprecedented success during this voyage in preserving the health of his ship's company, of whom he lost only four, and only one of these by any sickness. His method consisted chiefly in a strict attention to diet, and to keeping the ship clean, well-aired, and dry. Much however was found to depend upon the care and influence of the commanding officer; for the crew of the 'Adventure,' fitted out with the same provisions, had suffered considerably even at an early period of the voyage. On the day of Cook's admission to the Royal Society, March 7, 1776, a paper of his was read, giving an account of the methods he adopted for preserving the health of his men. On the 18th of April he communicated a second paper, relative to the tides in the South Seas: both of these are printed in the 'Philosophical Transactions,' vol. lvi. For the former the Society gave him the Copley medal, which is bestowed for the best experimental paper of the year. Of this second voyage he published his own journal, illustrated by maps and engravings; a supplementary volume containing the astronomical observations was published at the expense of the Commissioners of Longitude. The style is unpretending, clear, and manly, and, considering the imperfection of his education, does credit to his sense and ability.

While Cook was exploring the Southern Ocean, the attention of government was also turned towards discoveries in the Arctic regions. It was not thought fair, after so many years of labour and anxiety, to request him immediately to forego his honourable case; but when he volunteered his services, they were gladly accepted. Two ships, the 'Resolution' and 'Discovery,' the latter commanded by Captain Clerke, who had sailed with Cook in both his former voyages, were fitted out with everything that could promote the health and comfort of the crews and the scientific objects of the voyage. They sailed from Plymouth July 12, 1776. Cook's instructions were to proceed by the Cape of Good Hope to the Pacific, and to revisit the chain of islands lying along the southern tropic, in which he was to endeavour to disseminate and naturalise a variety of useful animals, to be carried from England and the Cape. He was then to bend his course northward, and on reaching the western coast of America, to proceed with as little delay as possible to the latitude of 65°, and then to use his best endeavours to return to the Atlantic by the high northern latitudes, between Asia and America, thus reversing the usual course of Arctic voyagers. He arrived at the Friendly Islands too late in the spring of 1777 to attempt anything in the Arctic Sea that year. In December he took a final leave of the Polynesian Archipelago, and on January 18, 1778, came in sight of an unknown group, to which he gave the name of Sandwich Islands, about 20° N. lat. Making no long stay, he reached the coast of America on March 7, being then in 44° 33' N. lat. In Nootka Sound, 49° 33' N. lat., he stopped a month to put the ships in perfect repair before encountering the dangers of the Polar Sea, and proceeded April 26, keeping near the coast whenever the state of the weather permitted. Following this course to the extreme northern point of the Pacific, he there examined a deep bay, afterwards named Cook's Inlet, concerning which strong hopes were entertained that it might lead to the long-sought discovery. These proving unfounded, he ran to the southward, along the narrow peninsula which forms the western boundary of the Kamtschatkan Sea; and after touching at Onalashka, made sail for Behring's Strait. There he determined the position of the most westerly point of America, 65° 40' N. lat., 168° 15' W. long.; and ascertained it to be distant from the coast of Asia only thirteen leagues. On August 18 he reached his extreme latitude, 70° 41', where he was stopped by an impenetrable wall of ice. He continued to prosecute his search until August 29, when the daily increase of ice warned him to return. Before proceeding to the south however he spent some time in examining the sea and coasts in the neighbourhood of Behring's Strait, during which he had satisfactory proof of the correctness of that navigator, and made valuable additions to our geographical knowledge of that region.

Returning to winter at the Sandwich Islands, he discovered two which he had not before visited, Mowee (Maui) and Owhyhee (Hawaii), the largest of the group. In sailing round the latter he spent ten weeks, from December 1 to February 13, 1779, without any serious disagreement with the natives, who, on the contrary, treated the English with the utmost respect. Speaking of the disappointment in not finding a northern passage, he uses the following words, which conclude his journal:—"To this disappointment we owed our having it in our power to revisit the Sandwich Islands, and to enrich our voyage with a discovery, which, though the last, seemed in many respects to be the most important that had hitherto been made by

Europeans throughout the extent of the Pacific Ocean." These pleasant anticipations were cut short by his tragical death. On the night of February 13, one of the 'Discovery's' boats was stolen. Cook went ashore on the 14th to try to recover it; the natives became alarmed, blows were struck, and Cook was obliged to fire in self-defence. In retreating to the boats, four of the marines who attended him were killed, and Cook, who was the last person left on shore, was struck down from behind. He struggled vigorously; but the confusion of the boats' crews was such, that no assistance was given, and he was soon overpowered. His body having been left in the possession of the natives, his bones only were recovered, the flesh having probably been devoured. His remains were committed to the deep with military honours. Mr. Samwell, an eye-witness, has given the fullest account of this melancholy event, which he ascribed to no scheme of premeditated treachery, but to a sudden impulse, arising from the belief that the loss of the boat would be revenged by hostile measures. Captain Clerke succeeded to the chief command, and returned in the following summer to the Polar Sea; but he was unable to advance as far as in the former year: the voyage therefore failed in its chief object. The ships returned by China and the Cape to England, which they reached in October 1780. An account of the voyage was published from Cook's Journal, continued by Lieutenant King. Charts and plates were executed at the expense of government, and one-half of the profits of the work were bestowed upon Cook's widow and children, upon whom a pension was settled.

As a navigator, Cook's merits were of the first order. He was thoroughly acquainted both with the practical and scientific parts of his profession, and possessed the qualities which fit men for responsible situations—a mind inventive, and full of resources, sagacity, self-possession, and decision, and an intuitive readiness of perception in professional matters; so that his first opinion as to a course to be pursued, the nature of an opening, tides, currents, &c., was seldom found to be incorrect. His perseverance was unremitting, and needed no relaxation nor respite. He was a strict disciplinarian, but watchful and solicitous in an uncommon degree for the health and comfort of his crews; and to this constant care and to his moral influence, as much as to his judgment, we must attribute that remarkable exemption from disease which his men enjoyed, in his last two voyages, through every variety of climate. He may be said to have banished that horrible disease, scurvy, from our naval service; and it is observed by Mr. Samwell, that his success in this respect afforded him more satisfaction than the reputation which attended his discoveries. But that which we wish to point out in his character as most rare and truly estimable, was his scrupulous justice and humanity towards the rude tribes whom he visited. For their propensity to thieving he found a candid apology; and any offences committed against their persons or property by his own crew, he strictly punished; making it a rule to pay liberally, if required, for the slightest articles, even to grass, wood, and water. Nor did he give way to the gratifying of a natural curiosity, when by doing so he was likely to provoke a hostile collision. Once only he was betrayed into an unjust aggression, which ended in bloodshed; an act which he remembered with pain, and in his journal acknowledged to be an error, while explaining the motives which led to the commission of it. The same benevolence and steady principle which he displayed in public, he carried into the private relations of life. His constitution was robust, inured to fatigue, and patient of self-denial.

COOKE, BENJAMIN, a highly distinguished composer and organist, was the son of Benjamin Cooke, a music-publisher in New-street, Covent Garden. He was born in 1739, and before he had attained his ninth year became the pupil of the celebrated Dr. Pepusch, under whom he made such progress, that when only twelve years old he was found capable of doing the duty of organist at Westminster Abbey, as deputy of Mr. Robinson, son-in-law and successor to Dr. Croft. On the death of Pepusch in 1752, Cooke was chosen as conductor of the Academy of Ancient Music, which office he held till 1789, when he relinquished it to Dr. Arnold. In 1757 he succeeded Bernard Gates as lay-clerk and master of the choristers at Westminster Abbey, and in 1762 was appointed organist of that venerable church. In 1777 the University of Cambridge conferred on him the degree of Doctor in Music. In 1782, after a severe contest, in which Dr. Burney was his chief opponent, he was elected organist of St. Martin-in-the-Fields. In 1784 he was nominated by George III. as one of the sub-directors of the famous Commemoration of Handel. He died in 1798, leaving two sons, one of whom Robert Cooke, followed his father's profession, and became organist of the abbey on the decease of Dr. Arnold; but shortly after, in a fit of insanity, threw himself into the Thames, and was drowned.

Dr. Cooke's compositions were chiefly for the Academy of Ancient Music, the Church, and the Catch Club. For the first he made the important additions, so well known to connoisseurs, to Galliard's 'Morning Hymn.' For the church he wrote a service and two anthems, which have always been highly esteemed. To the Catch Club he contributed his fine glees, 'In the merry month of May,' 'How sleep the brave,' 'Hark! the lark,' 'As now the shades of eve,' &c.; and obtained seven of the gold prize medals given by that society. He was the intimate friend of Sir John Hawkins, the musical historian—who profited much by the occasional hints of so learned a

professor—and the master of some of the deservedly celebrated musicians of the last and present age.

COOKE, GEORGE FREDERICK, a popular actor, was born in the city of Westminster, April 17, 1755. He was the son of an officer in the army, whose widow, on the death of her husband, went to reside at Berwick-upon-Tweed, where George was educated. At the usual age he was articled to a printer; but having imbibed a strong passion for the stage, he appeared, after various essays in private, as a professed actor at Brentford, in the character of Dumont in the tragedy of 'Jane Shore.' In 1778 he made his debut in London, at the Haymarket theatre, for a benefit, but without attracting any particular attention. After a period of two-and-twenty years, during which he became the hero of the Dublin stage, he returned to London, and made his first appearance at Covent Garden theatre, October 31, 1800, in the character of Richard III: his success was decided; and for ten years he divided the favour of the town with John Kemble. In 1810 he sailed for America, and arrived at New York on the 16th of November, in which city, intemperance having been long undermining a wonderfully strong constitution, he expired on the 26th of September 1812. His most popular characters were, in tragedy, Richard III., Iago, and Shylock; and in comedy, Kiteley, Sir Archy Macsarcasm, and Sir Pertinax Macyncephant. Mr. Kean, in one of his visits to America, caused a monument to be erected over his grave. His memoirs were published by his friend Mr. Dunlop from a manuscript journal kept by Mr. Cooke for many years, and other equally authentic documents, in 2 vols. 8vo, London, 1813.

COOLEY, THOMAS, an Irish architect, born in 1740, erected what is not only one of the most elegant public buildings in Dublin, but of its kind anywhere, the Royal Exchange in that city. This structure was begun by him in 1769, and although of but moderate size, is in a style at once noble and ornate: on the exterior, a Corinthian order is continued in columns and pilasters, between which there is only a single range of upper windows, the lower part of the intercolumns being filled in with solid rusticated wall, a circumstance that contributes materially to character; nor is the interior less remarkable for both elegance and commodiousness of plan, it being a rotunda inscribed within a square—the circular part formed by a peristyle of twelve columns of the composite order, and covered by a dome. This building is however no longer employed for the purpose for which it was designed. Having been, we believe, found too small for the increased commercial requirements of the city, it was some few years back abandoned by the merchants, and converted into a mechanics institution; and its architectural character has necessarily undergone some modification. Our description applies to its original condition. Cooley also erected the prison called Newgate (1773) in the same city, and commenced the noble pile of the 'Four Courts,' which was begun by him in 1776, but he did not live to complete it, little more than the west wing being erected at the time of his death in 1784; after which the edifice was carried on by Gandon [GANDON, JAMES], with some variations from the original design.

COOPER, ANTHONY ASHLEY. [SHAFTESBURY, EARL OF.]

COOPER, SIR ASTLEY, was born in the village of Brooke in Norfolk, where his father, Dr. Cooper, was curate. His mother was a popular authoress in her day, and published several novels and other literary productions, the object of which was to elevate and dignify the position of woman in society. Astley Cooper was born on the 23rd of August 1768, and was the fourth son. As a boy he was remarkable rather for his liveliness and good-humour than for application to study; but the following incident determined his choice of surgery as a profession:—A youth had fallen down in front of a cart, one wheel of which passed over his thigh, lacerating it and wounding the femoral artery. No surgeon was near, and the boy was in danger of dying from loss of blood, when young Astley Cooper bound his handkerchief sufficiently tight over the upper part of the thigh to prevent circulation in the artery, and thus stopped the bleeding till a surgeon arrived.

When in his thirteenth year his father was presented with the living of Great Yarmouth in Norfolk, to which place he immediately removed. In August 1784 young Cooper left home for London. His uncle, William Cooper, who was then a surgeon at Guy's Hospital, not being able to receive him into his house, he was placed with Mr. Cline, who was at that time surgeon to St. Thomas's Hospital, and one of the most distinguished surgeons of his day. To his connection with Mr. Cline, and the influence of his example, Sir Astley attributed much of his success in after-life.

In London he began to devote himself with earnestness to his new pursuit. He early perceived the importance of correct anatomical knowledge to the study of surgery, and made such advances by an habitual attendance in the dissecting-room, as to lead others to consult him in their difficulties. He also at this time attended the lectures of John Hunter, and was one of the few who comprehended the real value of this great man's theories and experiments. In 1787 he visited Edinburgh, and on his return was made demonstrator of anatomy at St. Thomas's Hospital. This led to his being in 1791 permitted to take part of the lectures on anatomy and surgery, which were then delivered together, with Mr. Cline. He was married in the same year, and after the close of the winter session paid a visit to Paris in 1792, where he was on the breaking out of the Revolution on the

10th of August. In the next course of lectures which he gave he lectured on surgery alone, and this was one of the first courses in London given on that subject independent of anatomy. It was perfectly successful. He was also this year appointed professor of anatomy at Surgeon's Hall, and was re-appointed in 1794 and 1795.

The earliest of Sir Astley Cooper's literary productions appeared in a volume of papers entitled 'Medical Records and Researches,' which was published in 1798. In these essays, the caution in collecting facts, and fearlessness in coming to conclusions when his facts were sufficient, which characterised him through life, are evident. Up to this time, although his reputation was increasing, his income was small. From the time he first commenced, he says, "My receipt for the first year was 5*l.* 5*s.*; the second, 26*l.*; the third, 64*l.*; the fourth, 96*l.*; the fifth, 100*l.*; the sixth, 200*l.*; the seventh, 400*l.*; the eighth, 610*l.*" On the death of his uncle in 1800 he was appointed to the office of surgeon at Guy's Hospital, but not without some difficulty, on account of his having been intimate with Horne Tooke and Thelwall, and others who held the same political opinions: a convenient change of politics however removed the difficulty, and he received the appointment. In this and the following year he read two papers before the Royal Society, 'On the effects which take place from the destruction of the membrana tympani, with an account of an operation for the removal of a particular species of deafness.' Although the operation here proposed was apparently successful, its benefits seemed to be only transient, and the practice of it was abandoned. For these papers the author had awarded to him the Copley medal of the Royal Society for 1802. In 1805 he was elected a Fellow of the Royal Society. In the same year he took an active part in the formation of the Medico-Chirurgical Society, which originated in some disagreement which took place in the London Medical Society. After some trouble the members of the Medico-Chirurgical Society obtained a royal charter, and it now takes the first position amongst the medical debating societies of London. In the first volume of the 'Transactions' of this Society is recorded a case of carotid aneurism, in which the artery was tied by Mr. Cooper. Although the case terminated unfavourably, the merit is due to him of having first attempted this operation, which has been successful in the hands of many subsequent operators.

In 1804 he brought out the first part, and in 1807 the second part, of his great work on 'Hernia.' At the time he first undertook inquiry into this subject, not only was the anatomy of the disease ill understood, but the operation for its relief was frequently unsuccessful. This work was published in atlas folio, and got up in an unnecessarily expensive style. Most of the illustrations were of the size of life. When the whole was sold, he was a loser of one thousand pounds by the work. It however added greatly to his increasing reputation, and in a few years after this (1813) his annual income from his profession amounted to twenty-one thousand pounds. This income is probably the largest ever received by a medical practitioner.

During the constant occupation which an enormous practice, besides his hospital duties and lectures gave him, he found time to pursue his favourite science of anatomy. He had a private dissecting-room over his stables, and here he employed dissectors, artists, and modellers, being present himself every morning by six o'clock to superintend and direct them for the day. In 1813 he was appointed professor of comparative anatomy to the College of Surgeons. During this year he removed from the City to the West End, not only with the view of cultivating his interest with those about court, but also for the purpose of avoiding the enormous practice of the City.

In 1817 he performed one of his most remarkable operations, that of tying the aorta. Although not successful, it is undoubtedly the boldest attempt in the annals of surgery. If any circumstances would have justified it, they were those in which Cooper operated. It has been attempted since without success. In 1818, in conjunction with his former pupil and colleague, Mr. Travers, he commenced publishing a series of surgical essays; but the plan was abandoned after two parts of the work had appeared. In 1820 Cooper was called in to attend on George IV., although he held no official position at court. Shortly after this he removed a stentomatous tumour from the head of the king. Six months after this the king offered him a baronetcy, which was accepted on the condition that, as he had no son, the title should descend to his adopted son and nephew Astley Cooper.

In 1822 Sir Astley Cooper was elected one of the Court of Examiners of the College of Surgeons, and the same year he brought out his great work on 'Dislocations and Fractures.' This work was characterised by the same diligence of research, and it was got up in the same style as his work on 'Hernia,' and, like that work, threw great light on many obscure points on the anatomy of the subjects it treated of, as well as suggested improved methods of treatment.

In 1827 Sir Astley Cooper was elected President of the College of Surgeons, an honour which he again received in 1838. In 1827 he lost his wife, and the grief which this occasioned, added to previous indications of ill-health, determined him to resign practice and retire to his estate at Gadesbridge. Here he lived only a short time, and returned the following year to his practice in London. He had however previously resigned his lectureship at St. Thomas's, which he did not resume. In 1828 he was married a second time, and in the

same year was appointed serjeant-surgeon to the King. In 1830 he was elected a Vice-President of the Royal Society.

In 1829 he published the first part of a work on the 'Anatomy and Diseases of the Breast.' This was accompanied by admirable illustrations and was a worthy companion to his previous works. The whole of this work was completed in 1840. In 1832 appeared a work of the same magnitude, on the 'Anatomy of the Thymus Gland,' which was an important addition to the knowledge of a very obscure organ of the human body. He was in the same year elected a member of the Royal Institute of France, and shortly after a corresponding member of the Royal Academy of Sciences. In 1834, on the occasion of the installation of the Duke of Wellington at Oxford, he received from that university the honorary degree of Doctor of Civil Laws. He visited Edinburgh in 1837, where new honours awaited him; he was made an LL.D. of the university, the freedom of the city was voted to him, and a public dinner was given him by the College of Surgeons.

In the year 1840 attacks of giddiness, to which he had been subject, increased, and he had much difficulty of breathing. These symptoms increased, and he died on the 12th of February 1841, in the seventy-third year of his age. He was interred by his own desire beneath the chapel of Guy's Hospital. A colossal statue by Bailey has been erected to his memory in St. Paul's Cathedral. In his will he left 100*l.* a year to be given every third year to the best essay on some surgical subject.

Sir Astley Cooper is a striking instance of what unceasing industry can accomplish. As a teacher, his kindness, and the easy manner with which he communicated his knowledge, placed him far above most of his contemporaries. His unwearied assiduity in the dissecting-room enabled him to produce those great works which are amongst the most important contributions to modern surgery, and must ever give him an important position in surgical literature. His influence on the surgery of the day was great. "Before his time," says Dr. Forbes, "operations were too often frightful alternatives or hazardous compromises; and they were not seldom considered rather as the resource of despair than as a means of remedy. He always made them follow as it were in a natural course of treatment; he gave them a scientific character; and he moreover succeeded in a great degree in divesting them of their terrors by performing them unostentatiously, simply, confidently, and cheerfully, and thereby inspiring the patient with hope of relief, where previously resignation under misfortune had too often been all that could be expected from the sufferer."

(*The Life of Sir Astley Cooper, Bart.*, by Branaby B. Cooper; *British and Foreign Medical Quarterly Review*, vol. x. and xvi.)

COOPER, JAMES FENIMORE, was born at Burlington, New Jersey, United States, on the 15th of September, 1789. His father was of a Buckinghamshire family which emigrated to America some twenty years before the birth of the future novelist. When James was about two years old, his father removed to the banks of the picturesque Otsego Lake, Western New York, and there founded the village of Cooperstown; and somewhat later he was elected a judge of the state of New York. Having himself initiated his son in the rudimentary branches of learning, he transferred him to the care of the Rev. J. Ellison, an episcopal clergyman at Albany, by whom he was prepared for college. He remained at Yale College from 1802 to 1805, when, having taken his degree, he entered the navy as a midshipman. He served at sea for six years, and his conduct won the approbation of his superiors, and the esteem of his fellow-officers. It was here he acquired that familiarity with a maritime life, and knowledge of the scenes and phenomena of the ocean, which lend such a charm to his naval stories. On retiring from the service he in 1811 married Miss Delancy, a sister of Bishop Delancy of New York, and took up his abode in the family village of Cooperstown.

His next few years were spent in private life. It was not till 1821 that Mr. Cooper appeared as an author. His first work was a novel, 'Precaution,' which professed to be a story of English life. It met with no success, but the author little daunted, speedily ventured before the public again, with 'The Spy—a tale of the Neutral Ground.' A thoroughly original and genuine American novel caught the American ear, much as 'Waverley' had caught the Scottish. Its success was immediate and unbounded. In England its vivid portraiture of American character and scenery gave it the additional charm of novelty, and Cooper at once took rank with the leading novelists of the day. The 'Pioneers' followed in 1823, and confirmed the reputation of its author. A year later appeared 'The Pilot—a Tale of the Sea.' These were the types of a long series of novels which during many years flowed from Cooper's prolific pen. He had in them brought before his readers the mighty forests and wide prairies,—the backwoods of America, with their original occupants the Red Indians and the Anglo-American hunters and settlers, who were rapidly supplanting them; and the sea with its daring American privateers; and again and again he was to reproduce these in more or less varied forms. The strength of his narrative, his power in delineating character, his command of the passions, keenness of observation, and descriptive skill were acknowledged without stint, and America was admitted to have produced a great original novelist.

Cooper like Scott thought the tide of success was to be taken at the

full; and he published novel after novel with a rapidity rivalling that of the author of 'Waverley.' For a time his imagination and stores of knowledge appeared to sustain without diminution the heavy drain. He was never happier in depicting peculiarities of character, nor carried the reader along with more rapidity and interest, than in the 'Prairie' and the 'Last of the Mohicans,' which appeared, after 'Lionel Lincoln' and one or two others, in 1826; in the 'Red Rover' and the 'Water Witch,' and the 'Wept of the Wish-ton-Wish,' which followed in succeeding years. But in these and a few others he exhausted his genius, and novels like 'Ned Myra,' the 'Sea Lions,' 'Mercedes of Castille,' and the 'Headman of Berne,' served only to call into clearer notice the weak points of their author; yet the 'Deerslayer' and one or two other of his later stories had so much of beauty and strength, that had there been no intervening failures, there would have been little reason to fancy that the hand of the great American novelist had lost its skill.

In 1826 Mr. Cooper visited Europe, where he remained for about ten years, his longest sojourns being made in London and Paris. The fruits of his European travel were the novels of 'The Headman,' 'The Bravo,' 'Heidenmaur,' and 'Mercedes,' none of which were very successful; and 'Homeward Bound,' and 'Home as Found,' which, with the 'Introductory Letter to his Countrymen,' stirred up some strong feeling. Nor was he, as we have already intimated, happier in the novels he wrote on his return to America, although in several of them he recurred to his old American forests and sea haunts. But he wandered also often into the regions of home and foreign politics, not even keeping clear of controversy in his novels; and his very inaptitude for reasoning rendered him the more dogmatic in maintaining his own views and irascible under contradiction or dissent. Some of his home critics he prosecuted for libel; his foreign opponents he denounced with unbounded wrath. However, as time wore on his better spirit resumed its sway, and it was rewarded at home and abroad with a return of the old admiration and esteem; so that his death, which occurred at Cooperstown, on the 14th of September 1851, caused a general expression of sorrow throughout America, which was sincerely responded to in this country, where he had hardly fewer readers and admirers than in his own land.

Besides the novels mentioned above, Mr. Cooper wrote 'The Pathfinder,' 'The Monikins,' 'The Two Admirals,' 'Wyandotté,' 'Wing and Wing,' 'Afloat and Ashore,' 'Autobiography of a Pocket Handkerchief,' 'Satanstoe,' 'The Chainbearer,' 'The Crater,' 'Oak Openings,' 'Jack Tier,' 'The Sea-Lions,' and we believe one or two others. He also wrote a 'History of the United States Navy,' which does not bear a very high reputation; 'Lives of Distinguished American Naval Officers,' 'Gleanings in Europe,' 'Sketches of Switzerland,' 'Notions of the Americans by a Travelling Bachelor,' and 'The Way of the Hour.' Most European languages have translations of some of Cooper's novels, and it is stated that one or two of the Oriental tongues possess a version of at least one of his stories. Most of the earlier novels and several of the later have been rendered into German; and in French there is a translation by Defauconpret in 23 vols. 8vo, Paris, 1838-45, and another in 6 vols. by Messrs. Larocbe and de Montémont.

COOPER, SAMUEL, a very distinguished English miniature painter of the 17th century, was born in London in 1609. He was brought up together with his brother Alexander by his uncle John Hoskins, likewise a miniature painter, and much distinguished in the reign of Charles I. Having displayed remarkable ability his uncle took him into partnership with him, but almost immediately dissolved the partnership, in consequence it is said of the marked preference which was invariably displayed for the works of his nephew. Cooper was without a rival in the time of the Commonwealth, and during the reign of Charles II. He painted the portrait of Cromwell which has been engraved by Vertue, but the head only was finished. The original is still in existence, but it has changed hands various times, and is at present, we believe, in one of the Royal collections. Walpole speaks in the highest terms of its merits; he says, that "if it could be enlarged to the size of one of Vandyck's portraits, the latter would lose by the comparison;" it is unquestionably a work of a very high order. Another of Cooper's masterpieces was a head of a person named Swinfield, which he took with him to the court of France, where it procured him the highest patronage: he remained some years in France and Holland. He was also much patronised by the court of Charles II. He painted the miniature of Charles, as well as that of his queen; the Duchess of Cleveland, the Duke of York, Monk duke of Albemarle, Archbishop Sheldon, the Chancellor Shaftesbury, and many others. Walpole possessed a drawing by Cooper of Pope's father lying dead in his bed; Cooper's wife was the sister of Pope's mother. Cooper died in London in 1672, in his sixty-third year, and was buried in old St. Pancras church, where a beautiful marble monument was raised to his memory, on which was inscribed a long and highly commendatory epitaph, in Latin, commencing—"Samuel Cooper, Esquire, of England the Apelles, of his age, and of art the ornament," &c. Samuel Cooper was an excellent musician, and also well versed in several foreign languages. His widow was pensioned by the crown. Cooper's excellence did not extend beyond the head, but so far he was without a rival; and the following entry in one of the pocket-books of Charles, the husband of Mary Beale, shows that in this respect he enjoyed the highest reputation among his contempo-

aries—"Sunday, May 5th, 1672, Mr. Samuel Cooper, the most famous limner of the world for a face, dyed."

The writer of the 'Essay towards an English school' (London, 1706), says that Cooper acquired this great excellence by copying the pictures of Vandyck and imitating his style. "Our nation," he says, "may be allowed to boast of him, having far exceeded all that went before him in England in that way (miniature), and even equalled the most famous Italians, inasmuch that he was commonly styled the Vandyck in little, equalling that master in his beautiful colouring, and agreeable airs of the face, together with that strength, rilievo, and noble spirit; that soft and tender liveness of the flesh which is inimitable." One of the chief excellences of his works is their freedom of execution, and their vigorous style, for though executed in water-colours they have the power and effect of oil-paintings.

* COOPER, THOMAS SIDNEY, A.R.A., was born at Canterbury, September 26, 1803. His parents were in humble circumstances, and his father having while Thomas was a child deserted his family, the boy was early thrown on his own resources. His fondness for sketching amounted to a passion, and having taught himself to draw, he succeeded in occasionally earning a few shillings by the sale of sketches of some of the old buildings in the city. A scene-painter at the theatre named Doyle, who one day saw him sketching, kindly offered to give him some instruction; and young Cooper profited so well by his lessons, and those of a drawing-master in the city, that on the death of Doyle in the following year, 1820, he was employed to finish the scenes which Doyle had commenced. For some three years he lived by scene-painting and teaching drawing, when (1823) he came to London to enter as a student at the British Museum and the Royal Academy. But he soon found it necessary to return to his teaching at Canterbury, where he remained till 1827, when he went to Holland and Belgium, where, while practising portrait-painting, and subsequently making landscape-drawings, he carefully studied the works of the old Flemish and Dutch masters, and familiarised himself with the principles and methods of working of the living painters there, especially of M. Verboeckhoven, the eminent animal-painter, of whom Mr. Cooper himself says, "Whatever I have been able to do since I left the Netherlands in my branch of art, I owe to him."

In 1831 Mr. Cooper returned with his wife and family to England, the revolution of the previous year having overturned all his arrangements. He now determined to adopt animal-painting as his particular branch of art; and carrying into it the minuteness of finish and much of the style of the Netherlands painters, the novelty of his manner as applied to English cows and sheep grazing in English meadows, caught the attention of the purchasers of pictures as soon as he was able to bring his works fairly to their notice. His first picture was exhibited at the Gallery of the Society of British Artists in 1833, and was so much admired that Mr. Vernon was led to give him a commission to paint the picture now in the Vernon Gallery. From that time his career has been one of almost unbroken prosperity. His pictures have always found purchasers, and at steadily advancing prices; and he has been a general favourite with the critics as well as with the patrons of art. In 1845 Mr. Cooper was elected an associate of the Royal Academy: he has not yet received the honour of full membership.

The range of Mr. Cooper's art is singularly limited. For the last twenty years he has painted, with little variation of style or character, oxen, cows, sheep, and goats. Almost invariably too they are standing still or lying down. Once he was fond of painting cattle on the fell sides, but now he usually confines himself to the rich Kentish meadows and marshes, with the well-fed cattle and sheep. As a matter of course there is a marvellous monotony in his pictures. Year after year he gives us the same ox and cow and sheep and goat, the same broken bit of foreground, the same grass and dock-leaves, the same trees, the same cloud, and the same thick atmosphere. But then ox and cow and goat and sheep are alike almost perfect in naturalness of attitude and occupation, in colour and in texture, and the other parts of each picture are of corresponding excellence. Whoever sees but one or two of Mr. Cooper's cattle-pieces at a time, and has not too strong a recollection of his other pictures, will perhaps be ready to acquiesce in the assertion of his more ardent admirers, that in his own particular department he is the first of English painters.

(Autobiographic sketch in *Art-Journal*, November 1849.)

* COPE, CHARLES WEST, R.A., was born at Leeds about 1815. He learnt the rudiments of art from his father, a drawing-master in that town; then passed to the school of Mr. Sass; subsequently entered as a student at the Royal Academy; and completed his art-education by the usual visit to Italy. Mr. Cope's earlier pictures, both historical and genre, attracted favourable notice at the Academy exhibitions; but he first became generally known as one of the three successful competitors for the 300*l.* prizes at the cartoon competition of the Royal Commission of the Fine Arts in 1843. Mr. Cope's cartoon, 'The First Trial by Jury,' at the exhibition in Westminster Hall, though felt to be too cold and formal, won general praise for its choice of subject, simplicity and clearness of treatment, excellent composition and good drawing. At the fresco competition in the following year, his fresco of 'The Meeting of Jacob and Rachel' obtained him a commission to paint one of the six frescoes in the House of Lords; and in due time he painted there 'Edward III. conferring the Order of the Garter on Edward the Black Prince.' He has since painted in the same edifice

BIOG. DIV. VOL. II.

'Prince Henry's Submission to the Law,' and 'Griselda's First Trial'; and by common consent his are placed among the most successful of the various attempts in fresco.

In 1843 Mr. Cope was elected A.R.A., and R.A. in 1848. His employment on the frescoes at the houses of parliament has somewhat interfered with his contribution of great pictures to the Royal Academy exhibitions, but he has most years sent works of sufficient importance to maintain his title to academic rank. In his earlier works he showed a partiality for subjects of a semi-domestic class, of which his 'Poor-Law Guardians—Board-Day—Application for Bread,' exhibited in 1841, and the 'Cotters' Saturday Night,' 1843, may be taken as samples; and in them he displayed much observation of character and very careful painting, but on the other hand they were wanting in spontaneity—the great deficiency perhaps in most of Mr. Cope's paintings. He also painted many subjects such as the 'Schoolmaster,' the 'Lovers,' &c., suggested by the poetry of Goldsmith, of which he appeared for some years to be a diligent student. He then advanced to a higher range of poetic imaginings, such as the 'Pastorella,' from Spenser; 'Melancholy' and the 'Dream' from Milton, and the like; and he proved himself not unequal to the effort. Since the fresco commissions directed his attention so forcibly to history, he has contributed to the academy exhibitions several excellent works in this highest line of art, and in that branch of poetic painting most nearly allied to it. Of these the principal are—'Last Days of Cardinal Wolsey,' painted for Prince Albert, and exhibited in 1848; 'Lear and Cordelia' (1850); 'Laurence Saunders, the second Marian Martyr, in Prison' (1851); the 'Marquis of Saluce marrying Griselda' (1852); 'Othello relating his Adventures' (1853); and the 'Children of Charles I. in Carisbrook Castle' (1855).

COPERNICUS, NICOLAUS. The real name was *Copernik*, or, according to others, *Zepernic*. We shall not discuss either this, or the somewhat more important question, whether he was born, as Junctinus asserts, at 38 minutes past four on the 19th of January 1472; or, as Moestlin asserts, at 48 minutes past four in the afternoon, February 19, 1473. Morin adopts the date of the latter, but remarks that the horoscope was a most happy one for talent, as appears by the nativity given by the former.

The principal authorities for the life of Copernicus are the account of Gassendi, published with the life of Tycho Brahe [BRAHE, TYCHO]; the 'Narratio,' &c., of RHETIUS; and an account prefixed to his 'Ephemeris' for 1551. The latter two we have not seen, but Gassendi cites abundantly from them. Weidler also mentions Adamus, 'Vit. Phil. Germ.' There is nearly a literal translation of a large part of Gassendi's life in Martin's 'Biographia Philosophica'; a sufficient abstract in Weidler; and a full account of the writings of Copernicus in Delambre's 'Hist. de l'Art Mod.,' vol. i.

Copernicus was born at Thorn in Prussia, a town on the Vistula, near the place where it crosses the Polish frontier. His family was not noble; but his uncle, Lucas Watzelrode, was bishop of Warmia (episcopus Warmiensis), whence it is frequently stated that Copernicus afterwards settled at a town of that name; whereas the cathedral was situated at Frauenburg, a town on the coast, near the mouth of the Vistula, and, as to social position, about 50 miles both from Königsberg and Danzig. Copernicus was educated first at home, and then at the University of Cracow, where he became Doctor of Medicine. He paid more than usual attention to mathematics, and afterwards to perspective and painting. A portrait of himself, painted by himself, passed into the possession of Tycho Brahe (see his 'Epistola,' p. 240), who wrote an epigram on it, the point of which appears to be (the portrait being a half-length) that the whole earth would not contain the whole of the man who whirled the earth itself in ether. After the completion of his studies at Cracow, Copernicus went to Italy, and stayed some time at Bologna, under the instruction of Dominico Maria. His turn for unusual speculation began to appear in his having at this time the notion that the altitude of the pole was not always the same at the same place. He was certainly at Bologna in 1497, and by the year 1500 he had settled himself at Rome, as appears by astronomical observations which he is recorded as having made. At Rome he gave public instructions, and in some official capacity (*magno applausu factus mathematicum professor*): he is said, while thus engaged, to have established a reputation hardly less than that of Regiomontanus. In a few years (but the date is not precisely stated) he returned to his native country, where (having taken orders, we suppose, in Italy) his uncle gave him a canonry in his diocesan church of Frauenburg. There, after some contests in defence of his rights, not very intelligibly described, he passed the rest of his days in a three-fold occupation—his ecclesiastical duties, his gratuitous medical practice among the poor, and astronomical researches. He went very little into the world; he considered all conversation as fruitless, except that of a serious and learned cast; so that he formed no intimacies except with grave and learned men, among whom are particularly recorded Gysius, bishop of Culm, and his pupil and follower, the celebrated Rheticus. A large mass of his epistles is said by Gassendi to have fallen into the hands of Broscius, professor at Cracow, but none have been published. He was all this time engaged as well in actual observation as in speculation. His instrumental means however were not superior to those of Ptolemy; and he perfectly well knew the necessity of improvement in this department. "If," said he to Rheticus

(whose Latin has certainly been misprinted, but in a manner which I ave, the meaning sufficiently clear), "I could determine the true places of the heavenly bodies within ten seconds of a degree, I should not glory less in this than in the rule which Pythagoras has left us."

Copernicus was struck by the complexity of the Ptolemaic system, and searched all ancient authors to find one of a more simple character. The earth stationary in the centre of the universe, the planets moving round it carried on enormous crystalline spheres (for though many might use this as mere hypothesis, the refutation of Tycho Brahé from the nature of the orbits of comets shows that he considered the material spheres as one of the opinions of his day), and finally, the enormous sphere of the fixed stars, carried round once in every 24 hours, struck him with a feeling that such a system could not be that of nature. He found in Martianus Capella, and others, proofs that an opinion had formerly prevailed to some extent that Mercury and Venus at least moved round the sun; that the Pythagoreans held the rotation of the earth; and that Philolaus had even imagined the earth to have an orbit round the sun. It is very doubtful to what point these several opinions were carried, or on what grounds they were supported; it is sufficient for our purpose here that Copernicus found such doctrines attributed to the sects and persons above mentioned, and took them into consideration, with a view to see how far phenomena could be made to follow from them with more simplicity than in the system of Ptolemy. At what time he finally adopted his own system is not very clear; his work was completely written in 1530, and from that time he did nothing except to add and alter; and since Copernicus says, in his epistle to Paul III., that he had been very long pressed by his friends to publish, the above date is not improbable. In the mean while his opinion was circulated even among the vulgar; and he was satirised on the stage at Elburg. His reasons had convinced Reinhold, Rheticus, Gysius, and others; and upon the representations made to him, Cardinal Schonberg was desirous of having the work printed, and wrote to Copernicus to that effect from Rome in 1536. But though backed by a cardinal, a bishop, and two of the most learned astronomers of the age, Copernicus was well aware of the odium which an attempt to disturb established opinions would excite; and it was not till about 1541 that a tardy consent was extorted from him. The work was accordingly delivered to Gysius, and by him to Rheticus, who, thinking that it would be best printed at Nuremberg, entrusted it to Andrew Osiander, who superintended the printing, and wrote the remarkable preface, which is always attributed, and even by Delambre, to Copernicus himself. This is explicitly stated by Gassendi, and the reason assigned is the obvious one that Osiander (besides thinking it necessary to print the cardinal's request) was afraid of shocking public opinion, and thought it best to represent the scope of the work, not as actually affirming the motion of the earth, but as using such an hypothesis for the more simple and ready calculation of the heavenly motions.

He says, "It is not necessary that hypotheses should be true or even probable; it is sufficient that they lead to results of calculation which agree with observations." He points out the admitted defects, and admitted unlikelihood, of several points of the Ptolemaic system; requires that the new hypothesis should be admitted on the same footing as the ancient ones, and ends thus—"Neither let any one, so far as hypotheses are concerned, expect anything certain from astronomy, since that science can afford nothing of the kind; lest, in case he should adopt for truth things feigned for another purpose, he should leave this study more foolish than he came."

With such safeguards, headed by the urgent request of a cardinal, and dedicated, probably by permission, to the pope, the work was ushered into the world, of which it was the ultimate destiny to help largely in overthrowing submission to authority in matters of science, whether to the doctrines of the Greeks or to the reputed interpretation of the sacred writings. The title-page is as follows:—

NICOLAI CO-
PERNICI TORINENSIS
DE REVOLUTIONIBUS ORBI-
um coelestium libri vi.

Habes in hoc opere iam recens nato & edito,
studiosæ lector, Motus stellarum, tam fixarum
quàm erraticarum, cum ex veteribus tum etiam
ex recentibus observationibus restitutos: & no-
tis insuper ac admirabilibus hypothesibus or-
natos. Habes etiam tabulas expeditissimas, ex
quibus eodem ad quodvis tempus quàm facilli-
me calculare poteris. Igitur eme, lege, frue.

Ἀγαπητὸς διδάσκαλος

Norimbergæ apud Joh. Petreum.

Anno M. D. XLIII.

The taste of what we now should call the puff in the title-page is doubtless that of Osiander, to whom it is due that the great work of

Copernicus contains an expression of recommendation to buy it in the title-page, being the only instance of the kind we know. The second edition, edited by Rheticus, was published at Basel, 1566, and is little esteemed; the third, edited by Muler, was printed at Amsterdam in 1617, and again in 1640, with notes: it is the most correct of the three. This same Muler, in his 'Tabulæ Frisicæ', Alcmear, 1611, has reduced the hypotheses of Copernicus to the form of tables.

We now come to the description of the Copernican system, by which we mean, the system actually promulgated by Copernicus, and not the Keplerian, Galilean, Newtonian, Halleian, Laplacean, &c., system which bears the name. We have before remarked (BRUNÉ, Tycho), that it is customary to call all existing notions on the system of the world, Copernican. This matters little, considered as a mere method of expression; but it becomes of consequence when, by means of it, a degree of lustre is thrown on the speculations of Copernicus, which, properly considered, they do not need, and, critically examined, they will not bear. We are accustomed to see Copernicus represented as a man so far in advance of his age, that in the main points of his system nothing has been added and nothing subtracted. The plates in our elementary works show, under the heading of the 'Copernican system,' planets, satellites, and comets, all with orbits such as the latest discoveries have assigned. We shall therefore exhibit the 'Copernican system' as far as we can in the words of its author (translated, of course), and at greater length than would have been necessary had no misconception prevailed. It will hardly be supposed that we intend an absolute depreciation of the merits of one of the most original talents that ever existed. Copernicus was a mathematician of the first order, a sincere lover of truth, a mind free from trammels to an extent which was then almost unknown, and which we should have deemed almost incredible had we not had the proof before us. It is no easy thing for us to conceive the state of a head furnished in youth with theories upon all things in heaven or earth, proved in as many words by the assertion that Aristotle said it.

The work 'De Revolutionibus,' &c., consists of an introductory dedication to Paul III., and six books. In the former Copernicus distinctly informs us that, being discontented with the complexity of the prevailing systems, he closely examined all the writings of the ancients, to see if he could find anything better. He found the testimony of Cicero and Plutarch, as to the opinions of Nicetas, Pythagoras, and Philolaus. He thereupon claims for himself the same licence, adverts to his hypothesis as purely fictitious, and says, 'Quamvis absurda opinio videbatur, tamen quia sciebam aliis ante me concessam libertatem, ut quolibet fingerent circulos ad demonstrandum phenomena astrorum. Existimavi mihi quoque facile permitti, ut experirem, an posito terræ aliquo motu firmiores demonstrationes, quàm illorum essent, inveniri in revolutione orbium coelestium posset.' With regard to the word demonstration, it must be particularly remembered that at this period the term, as applied to astronomy, always meant a showing how the thing would happen if the supposition were true, not a proof of the supposition itself. Thus, in this sense, the supposition of a daily motion of the sun round the earth may be made to yield a perfect demonstration of the phenomena of day and night; and it would be legitimate to say that of two hypotheses, one false and one true, the false one might give truer demonstrations of the celestial motions than the other.

The first book contains the propositions—1. That the universe is spherical; which is proved by old reasons, such as that a sphere is the most perfect figure, &c. 2. That the earth is spherical; for which he gives the same reasons as are now given. 3. That the earth and sea make one globe. 4. That the motions of all the heavenly bodies must be either uniform and circular, or compounded of uniform and circular motions. Nothing but circular motion, he asserts, could reproduce phenomena periodically; and he maintains that a simple body must move circularly. 5. He examines the questions whether the earth can have an axial and an orbital motion, and satisfactorily shows that, supposing the distance of the fixed stars to be immense, there is no astronomical reason to the contrary. 6. He gives what he imagines to be a proof that the sphere of the fixed stars is immensely distant. It must be observed that he has no notion of a universe of stars unequally distributed throughout space. 7 and 8. He examines and argues against the reasons of the ancients for placing the earth in the centre of the universe, by considerations which are as purely imaginary as those against which he was contending. He says that circular motion must be that of a whole, rectilinear motion that of a part separated from its whole; and from this assumption he deduces the falling of a body to the earth. That rectilinear and circular motion can exist together is, according to him, a thing of the same kind as the notion of a horse existing with that of an animal. He is throughout possessed by the opinion that there must be a 'centrum mundi,' or fixed point in the middle of the universe, which however he considers to be the sun, not the earth. It is needless to say that the 'centrum mundi' forms no part of the Newtonian system. 9. He contends for the possibility of the earth having several motions. 10. He establishes the order of the planets, remarks that it is impossible to explain the motion of Mercury and Venus upon the supposition of the earth being their centre, and observes that the motion of the other planets round the sun is perfectly possible, consistently with

that of the earth, if the radii of their orbits be made large enough. He draws a diagram of the system in the manner now usual, and concludes with the following words, which must be considered as the first announcement of the system:—"Proinde non pudet nos fateri hoc totum, quod luna præcingit, ac centrum terræ per orbem illum magnum inter cæteras errantes stellas annuâ revolutione circa solem transire, et circa ipsum esse centrum mundi: quo etiam sole immobili permanente, quicquid de motu solis apparuit, hoc potius in mobilitate terræ verificari," &c. It must be observed that he lays down a sphere for the fixed stars so distinctly, that his commentator Mûler finds it necessary to remind the reader that he does not name the spheres of the planets. But we shall presently see that he could not divest himself of the idea that the primitive motions of the planets were such as would be caused by their being fixed in immense crystal spheres which revolve round the sun.

Before proceeding further it will help us here to observe, that Copernicus does not in the smallest degree attempt to answer the mechanical objections to the earth's motion, which were urged with success against his system till the time of Galileo. The laws of motion, as then explained, and as admitted by Copernicus himself, were altogether insufficient to explain why, if the earth moved, a stone should fall directly under the point from which it is dropped. No explanation of such difficulties is given by Copernicus, nor can we find (nor did Delambre find) that they are even alluded to as an element of the question. If the mechanics of Copernicus had been true, the system of Copernicus would have been physically impossible. Now this is an essential element in the character of a discovery, which is materially altered if that which is advanced as true be advanced on false grounds. It is true that fire burns, and it is true that two and two make four; but it is false that two and two make four because fire burns. We give no credit to the Pythagoreans, if it be true, as asserted, that they placed the sun in the centre of the planets because they thought fire the most excellent of all things. We may consider the omission of Copernicus in two different lights. The first is, that he saw the mechanical difficulties, but was so struck by the simplicity of his astronomical system that he thought it more probable than the mechanics of his day, and suspected that future researches would produce laws of motion which should allow of the possibility of his system; and thinking thus, he judged it more wisely not to enter upon the mechanical question, so as thereby to shock two sets of received opinions at once. This would do honour to his sagacity; but unfortunately, the single sentence below alluded to, the equestrian simile, prevents us from supposing that if he considered the subject mechanically at all, he was other than satisfied with his own conclusion, "Cum ergo motus circularis sit universorum, partium vero etiam rectus, dicere possumus manere cum recto circularem, sicut cum ægro animal." The word in italics must be a misprint for *equo*, as remarked by Mûler. The latter distinctly points out that this is meant to explain the difficulty of a falling stone, and adds, "Sententiæ hujus veritas dependet ex hypothesi Copernicana;" that is, the truth of the proof depends upon that of the thing proved. He should have said (and possibly did mean), that upon the truth of this sentence the Copernican hypothesis depends, so far as it was proved by Copernicus himself. Our readers now must begin to have an idea how great an injustice has been done to those who found better reasons for the co-existence of rectilinear and circular motion, by the attachment of the name of Copernicus to the present cosmical system.

The second method by which we may suppose Copernicus to have reconciled difficulties, is the actual assertion made both by himself and Oslander, that the hypothesis of terrestrial motion was nothing but an hypothesis, valuable only so far as it explained phenomena, and not considered with reference to absolute truth or falsehood. It is usual to consider the expressions in question entirely as a concession to general opinion, and as intended either to avoid the Inquisition, or to induce those to look into the book who would otherwise have put it aside as anti-Mosaic and heretical. And though there may be some truth in this, we are on the whole inclined to suspect that the hypothetical hypothesis, as we may term it, really did bias the mind of Copernicus much more than has been supposed. We do not at all concede that the interference of ecclesiastical power was as likely in the case of the Prussian priest of 1540, as in that of the Italian layman of 1533. Nothing is more common than to view the middle ages as a whole, without noticing the ebbs and floods of power and opinion. The epoch contained between the last Lateran Council and that of Trent, in which the work of Copernicus was written, printed, and published, was sufficiently occupied by diocesan councils, both against Luther, and on the reformations in discipline, of which the necessity began to be perceived. It appears to us far the most likely that the mind of Copernicus must have balanced between the two views we have described, and probably must have inclined different ways at different times.

We now come to the brightest jewel in the crown of Copernicus, the method in which he explained, for the first time and with brilliant success (so far as demonstration went, as before described), the variation of the seasons, the precession of the equinoxes (book i. cap. 2, book iii., and book vi. cap. 35), and the stations and retrogradations of the planets. The latter point is fully made out, and in the manner now adopted, so far as the *qualities* of the phenomena are con-

cerned: we shall presently see the method of rectifying the *quantities*. With regard to the variation of the seasons, Copernicus explains it rightly, from the continual parallelism of the earth's axis. But he cannot obtain this parallelism from his mechanics. He imagines that if the globe of the earth move round the sun, and also round its own axis, the axis of rotation must always preserve the same inclination to the line joining the centre of the earth and sun: just as when a ball fastened by a string is made to spin, and a conical motion is simultaneously given to the string and ball. It is most evident that he got this idea from the solid crystal spheres. If the earth's axis were fixed in an immense sphere, with which it turned round the sun, and if in the first instance the axis produced would pass through the axis of the sphere, the complete phenomenon of Copernicus would be produced. The earth's axis would then describe a cone yearly. To produce parallelism, Copernicus imagines what we may call an anticonical motion, namely, that the earth's axis is itself endued with such motion, independent of its motion in the sphere, as would, did it act alone, carry the axis round the same cone in a year, but the contrary way. The effect of the two motions is to destroy each other, and the axis remains parallel in all its positions. Then, by supposing the anticonical motion to be a little greater than the direct conical motion, by 50" in a year, he produces the phenomenon of the precession of the equinoxes. If we consider that even Newton himself, in tracing the effect of the forces which cause the precession, is thought to have misconceived his own laws of motion, it is not at this part of the mechanics of Copernicus that we need express surprise: and this explanation of the cause of the seasons and of the precession, together with that of the stations, &c. of the planets, must always place him among comical discoverers of the first order of sagacity.

All that we have hitherto described will explain the mean motions of the solar system, and the mean motions only. To account for all irregularities, Copernicus (hampered with the notion that all motions must be compounded of circular ones) is obliged to introduce a system of epicycles entirely resembling that of Ptolemaeus. It will surprise many readers to hear that the greater part of the work of Copernicus is taken up with the description of this most essential branch of the real 'Copernican system.' But it must be added that the Copernican epicycles are more successful than the Ptolemaic. The latter were utterly unsufficient as a means of demonstrating the changes of distance of the planets and earth. The former, founded upon a basis which brought this point not very far from the truth at the outset, made a much nearer approximation to a correct representation of the inequalities. But as the epicyclic system is not now connected with the name of Copernicus, we need pursue this subject no further, satisfied that what we have done will have a tendency to put the reputation of that sagacious investigator in its proper place, and that no mean one, though lower than the one usually assigned to it.

Of the tables of Copernicus, his trigonometrical formulae, &c., this is not the place to speak: they are more connected with the sciences they belong to than with his biography.

While Copernicus was in daily expectation of receiving a complete copy of his work from Rheticus, he was seized with hemorrhage, followed by paralysis. The book actually arrived May 23, 1543, and, as Gysius wrote to Rheticus, Copernicus saw it, and touched it, but was too near his end to do more. He died in a few hours after, and was buried in the cathedral to which he belonged.

We copy the following references to sources of information from the 'Bibliog. Astron.' of Lalande, p. 595; Adam, 'Vites Phil. Germ.,' Tycho Brahe, 'Orat. de Math.,' Jovius, 'Elog. Doct. Vir.,' Bullialdus, 'Proleg. Astr. Phil.,' Vossius, 'De Sci. Math.,' Crasso, 'Elog. d'Uom. Letter.,' Ghilini, 'Teatro,' tom. ii.; Freherus, tom. ii.; Blount, 'Cens. Cel. Auct.,' Paschius, 'De Invent. Nov. Ant.,' 'Actu Phil.,' part v., p. 384; Zernecke, 'Chronik von Thorn,' 2 ed., Berlin, 1727; 'Pantheon der Deutschen,' 1796; 'Berlin. Monatschrift,' August 1792, March 1793; 'Preussisches Archiv,' December 1796; Wieland, 'Teutscher Merkur,' November 1776. We may here notice that Ghilini asserts an epistle 'De Motu Octavæ Sphæræ' to have been printed; but as Gassendi had never seen it, and we can find no mention of it, we conclude no such epistle was published, though one with that name was certainly written.

COPLESTON, REV. EDWARD, D.D., was born February 2, 1776, at the rectory-house, Offwell, Devonshire. His father, the Rev. John Bradford Copleston, was the rector of that parish, and he educated at his own residence a limited number of pupils, among whom was his son Edward. In 1791 Edward Copleston was elected to a scholarship at Corpus Christi, Oxford; in 1793 he obtained the Chancellor's prize for a Latin poem; and in 1795 he was elected a Fellow of Oriel College. He obtained the Chancellor's prize for an English essay on 'Agriculture' in 1796, and in 1797 was appointed college-tutor, though he had not then taken his degree of M.A. In 1802 he was elected Professor of Poetry to the university, in which office he succeeded Dr. Hurd. He published in 1813 the substance of the lectures which he had delivered, under the title of 'Praelectiones Academicæ,' a work which gained him a high reputation for pure and elegant Latin composition combined with extensive poetical information. Some severe attacks on the University of Oxford having been made in the 'Edinburgh Review,' Mr. Copleston published in 1810 'A Reply to the Calumnies

of the Edinburgh Review against Oxford,' which was followed by another 'Reply' in the same year, and by a third in 1811. These replies were greatly esteemed by the university, and regarded as a triumphant defence. In 1814 Copleston was elected Provost of Oriel College, and soon afterwards the degree of D.D. was conferred upon him by diploma, the instrument setting forth that this distinction resulted from a grateful sense of the many public benefits which he had conferred upon the university. Dr. Copleston is chiefly remembered as a divine by his work on 'Predestination,' which consists, for the most part, of three sermons preached at St. Mary's church, Oxford, 'An Enquiry into the Doctrines of Necessity and Predestination, with Notes and an Appendix on the 17th Article of the Church of England,' 8vo, London, 1821. Between the years 1811 and 1822 he contributed many articles to the 'Quarterly Review.' In 1826 Dr. Copleston was appointed to the deanery of Chester, and in 1827 he succeeded Dr. Sumner in the bishopric of Llandaff and deanery of St. Paul's, London. He also held the honorary appointment of professor of ancient history to the Royal Academy of Arts, and was a fellow of the Society of Antiquaries. After he became a bishop his time was chiefly occupied in the performance of the duties of his diocese. Some of his sermons, charges, and speeches in the House of Lords, were published at the time when made. He resided mostly during the latter part of his life at Hardwick House, near Chepstow, where he died October 14, 1849.

(*Memoirs of E. Copleston, Bishop of Llandaff, with Selections from his Diary and Correspondence, &c.*, by William James Copleston, London, 1851, 8vo.)

COPLEY, JOHN SINGLETON, was born at Boston, in the United States, July 8, 1737. His father, who was of English extraction, resided in Ireland until his removal to America, which took place so immediately before his son was born that Ireland has claimed him as a native. He was educated in America; and without the aid of instructors, simply by studying from nature in the groups around him and the neighbouring woods, he taught himself to paint. In 1760 he sent a picture of a 'Boy and Tame Squirrel' to the exhibition of the Royal Academy, which was universally admired. By the year 1767 he was in the receipt of a considerable income as a portrait-painter, and was well known both by his works and by name to his brother painters on this side of the Atlantic. In 1774 he indulged a long-felt wish to visit Italy, which he reached by way of London. In the following year he returned to London, and established himself in George-street, Hanover-square. In 1777 he was elected an associate of the Royal Academy, and in 1783 he became a member. He died in 1815. His son, the present Lord Lyndhurst, possesses some of his father's best paintings.

The best known of Copley's works is the 'Death of Lord Chatham,' now in the National Collection. It was engraved by Bartolozzi on a plate of an unusual size, and the engraving was extensively sold. The painter sent an impression to General Washington, and another to John Adams. Copley painted many historical subjects, some sacred, and not a few illustrating the history of England, particularly the period of the revolution. Perhaps the most spirited design from his pencil is the death of Major Pierson, a young officer who died in the defence of St. Helier's in Jersey against the French, at the moment when his troops gained a victory over an enemy of superior numbers. There is a dryness and stiffness of manner in Copley's paintings generally which is less observable in this picture. It is among those in the possession of Lord Lyndhurst.

CORAM, THOMAS, was born about 1668, was brought up in the mercantile navy, and became early in life the captain of a merchant ship trading to the Antilles. While in London his business often led him from the east-end to the city, and his feelings were harrowed by witnessing "young children exposed, sometimes alive, sometimes dead, and sometimes dying." His compassion was awakened; and, finally, his enthusiasm roused, he determined to make an effort to rescue the poor victims from destruction. He began cautiously by making the subject a frequent topic of conversation. He won adherents. He devoted his labours and his fortune to the object in view. He ultimately obtained a wider and more substantial support. At length, after seventeen years of untiring perseverance, on Nov. 20, 1739, he presented to a meeting of noblemen and gentlemen at Somerset House, a charter for a 'Hospital for the Maintenance and Education of exposed and deserted Children.' The institution was to be supported by subscription. On October 27, 1740, twenty children were first admitted at the hospital in Hatton Garden. The institution appealed to the benevolent feelings of the public, and in 1756 parliament voted 10,000*l.* to enable the hospital (which had by this time been removed to its present site, and is known as the Foundling Hospital) to receive children indiscriminately. This system commenced in June, and by the end of the same year 1783 children had been admitted, and in the following year 8727. The effect had not been foreseen. A most material check having been removed, female impudence became far more common; and even the destruction of infant life was vastly increased, for the children were transmitted in baskets from distant parts of the country, and of 14,934 children admitted under this system, only 4400 lived to be apprenticed. The evils became so enormous that parliament again interposed, declared its disapproval of the system, and discontinued the grant of money.

The children are now admitted only under certain restrictions, and the charity is much more effectively distributed.

But the more serious results of the wide extension of the charity were not seen by Captain Coram. While he lived he employed himself actively in the concerns of the hospital, but not in them alone; many other useful and patriotic objects, chiefly in regard to the colonies with which he had been formerly connected, received his attention. His benevolence however had exhausted his means. His friends therefore arranged to raise a subscription to provide him with an annuity, but before carrying the scheme into execution, and in order not to offend the good old man, Dr. Brocklesby made the plan known to him. His answer was, "I have not wasted the little wealth of which I was formerly possessed in self-indulgence or vain expenses, and am not ashamed to confess that in my old age I am poor." In 1749 an annuity of about 170*l.* a year was secured for him, but he did not enjoy it long. He died March 29, 1751, and was buried in the chapel of the hospital under the communion-table, the funeral being attended by the governors, the children, and his numerous friends and admirers.

CORBET, RICHARD, was the son of a wealthy gardener at Ewell in Surrey, whose professional skill and personal amiability are commemorated in verses by Ben Jonson. He was born in 1582, and received his education at Westminster School and at Christchurch, Oxford, of which he became dean. After taking orders, he attained high popularity in the pulpit, being, in Anthony Wood's phrase, "a quaint preacher." His talents, his social qualities, and his firm adherence to the High Church party, gained for him, through the patronage of Buckingham, the place of chaplain to James I.; and he was afterwards elevated in succession to the bishopric of Oxford and to that of Norwich, each of which he held about three years. He died in possession of the latter see, in 1635. Although strongly adverse to the Puritans, and employed by Laud in several of his proceedings against them, he did much to mitigate the harsh commands of his superior, both by forbearance in the execution of them, and by the gentleness which he showed when compelled to act. His proved ability, his tolerance and desire for moderate procedure in ecclesiastical affairs, and the cheerful kindness of his disposition, made Bishop Corbet beloved, and even respected, in spite of his exuberant eccentricities. These indeed were such as even the coarseness and freedom of manners prevalent in that age could hardly make reconcilable with the clerical character. Although we were to disbelieve some of those anecdotes of unbecoming joviality collected by Aubrey, there would remain abundant evidence of extreme light-mindedness. His only published writings are his poems. These were first collected in 1647, 12mo, under the title of 'Poetica Stromata'; they were reprinted in 1648 and 1672; and they were edited in 1807, 12mo, with a life of the author, by Octavius Gilchrist. They are, almost without exception, of a cast more or less ludicrous; and several of them are satires on the Puritans. They possess very much merit in their class. The 'Journey to France,' and 'Farewell to the Fairies,' have been inserted in several collections of English poetry; but there are others in the series which, for their humorous merit and pointed terseness, would not have been unworthy of the same distinction.

CORDAY D'ARMANS, MARIE ANNE CHARLOTTE, commonly called CHARLOTTE CORDAY, who numbered among her ancestors the great tragedian Corneille, and was of noble family, was born at St. Saturnin, near Sees, in Normandy, in 1768. The republican principles of the early revolutionists struck deep root in her enthusiastic mind, and her zeal for their establishment was heightened after the rise of the Jacobins and the overthrow and proscription of the Girondists, May 31, 1793, by the presence and conversation of those chiefs of the latter party who fled into Normandy in hope to rouse the people in their favour. Resolved to advance the cause which she had at heart by some extraordinary action, Charlotte Corday travelled to Paris, where having gained admission to the galleries of the Convention, she was still more incensed by the threats and invectives which she heard showered upon her own friends. Her project took the form of a determination to assassinate one of the principals of the dominant faction. Whether to deter them by terror, as an act of revenge, or as an example of what she regarded public justice, she chose Marat, one of the most violent and bloody of the Jacobins, to be her victim. After two unsuccessful attempts, she obtained admission into the chamber in which he was confined by illness, July 15, under pretence of communicating important news from Caen; and being confirmed in her purpose by his declaration that in a few days the Girondists who had fled thither should be guillotined in Paris, she suddenly stabbed him to the heart. He gave one cry and expired. Being immediately arrested and carried before the Tribunal Revolutionnaire, she avowed and justified the act. "I have killed one man," she exclaimed, raising her voice to the utmost, "to save a hundred thousand; a villain, to rescue innocents; a wild beast, to give peace to my country. I was a republican before the revolution, and I have never been wanting in energy." But she indignantly denied that she had any accomplices, declaring that it was her own act, prompted only by a desire to render peace to her country. Notwithstanding her confession, the court, with an affectation of impartiality which in this case could be ventured on, assigned her a defender, and went through

all the formalities of trial. The speech of her advocate [CHAUVEAU, LAGARDE] is rather remarkable. He neither denied nor extenuated the act; and acknowledged it to have been long premeditated. "She avows everything, and seeks no means of justification; this, citizen-judges, is her whole defence:—this imperturbable calmness, this total self-abandonment—these sublime feelings, which, even in the very presence of death, show no sign of remorse, are not natural. It is for you, citizen-judges, to fix the moral weight of this consideration in the scales of justice."

Charlotte Corday returned thanks to the pleader. "You have seized," she said, "the true view of the question; this was the only method of defence which could have become me." She heard her sentence with perfect calmness, which she maintained to the last moment of her life. Her personal charms were of a high order; and her beauty and animation of countenance, even during her passage to execution, added greatly to the interest inspired by her courage and loftiness of demeanour. She was guillotined July 17, 1793.

CORELLI, ARCA'NGELO, musical composer, on whom his countrymen bestowed the cognomen of 'Il Divino,' was born at Fusignano, in the Bolognese territory, in 1653. Adami says that his instructor in counterpoint was Simonelli; and it appears pretty certain that his master for the violin, the instrument of his early adoption, and which he never abandoned, was Giambattista Bassani of Bologna. It is stated that Corelli went in 1672 to Paris, but that through the jealousy of Lully he was soon obliged to quit that city. In 1680 Corelli visited Germany, where he received extraordinary honours, not only from the public, but from sovereign princes, among whom the elector of Bavaria distinguished himself by the hospitable manner in which he treated the great musical genius. Corelli returned to Rome at the expiration of about two years, and published his first set of 'Twelve Sonatas for two Violins and a Base,' in 1683. A second series appeared in 1685, entitled 'Balletti da Camera.' These were succeeded in 1690 by a third set; and the fourth was published in 1694. His admirable sonatas for violin and base, or harpsichord, in which all violinists are early initiated, were printed, with a dedication to the electress of Brandenburg, in 1700. When James II. sent, in 1686, the Earl of Castlemaine as ambassador to the pope, Christina of Sweden, then at Rome, celebrated the event by having an opera written, composed, and performed, in the holy city. The band employed on this occasion consisted of 150 stringed instruments, a prodigious and unprecedented force for those days, and Corelli was chosen as leader, which duty he performed in so satisfactory a manner, that the Italian opera in Rome was placed under his direction chiefly, and in 1700 had arrived at a degree of excellence which it had never before attained in the capital of Italy. He now gained the friendship of the well-known patron of art, the Cardinal Ottoboni, at one of whose 'Accademie' he met Handel, then travelling in Italy. As a mark of attention to the great German composer, the cardinal had the serenata, 'Il Trionfo del Tempo e della Verità' (afterwards altered into 'The Triumph of Time and Truth') performed, the overture to which being in a style quite new to Corelli, he led it in a manner that displeased the irascible composer, who rudely snatched the violin from the hands of the gentle Italian. Corelli no farther resented this indignity than by calmly observing, "My dear Saxon, this music is in the French style, which I do not understand." Some satire was half concealed in this remark, for Handel at that time certainly imitated Lully's overtures, and the innuendo, which was a lenient punishment for conduct so violent, could not have been misunderstood by him. Corelli however, though an exquisite performer in regard to expression and taste, had devoted more of his attention to those high qualities which ought to be considered paramount to all others, than to what is commonly understood by the term execution; he consequently was sometimes embarrassed by having music placed before him which at first sight he could not easily master, and was abashed on finding that musicians infinitely inferior to himself could play it without preparation or hesitation. It was at Naples that he met with some mortifications of the kind alluded to, which prompted him to quit abruptly, and somewhat chagrined, that city, to which he had been very warmly invited, and where it was intended that he should be received with every mark of distinction.

Corelli's greatest work, his 'Concerti Grossi,' or Twelve Concertos, was written many years before it appeared in print. The Concerti were engraved in score at Amsterdam, and published in December 1713, six weeks only before their author breathed his last, an event which took place on the 18th of January 1713. He was buried in the church of Santa Maria della Rotunda (the ancient Pantheon), where a monument, with a marble bust, is erected to his memory, near that of the greatest of painters, Raffaele. On the pedestal is a Latin inscription by the Cardinal Ottoboni, which records in simple and elegant terms the merits of the composer and the friendship of the writer.

Corelli's best works are imperishable. Rousseau has said that he who without tears can listen to Pergolesi's 'Stabat Mater,' may feel assured that he has no genius for music. We will also risk an assertion—that those who can without admiration hear the eighth concerto of Corelli, as it used to be performed at the Ancient Concert, though they may be able to boast great powers of execution as instru-

mentalists or vocalists, can have no conception of the higher beauties of composition—can possess no soul for pure harmony.

CORENZIO, BELLISARIO (Cavaliere), a Greek, and a celebrated painter, distinguished for his ability and notorious for his invidious tyranny over the painters of Naples in his time, whether Neapolitans or strangers, was born about 1558. He was five years the pupil of Tintoretto at Venice, and settled in Naples about 1590. Here in conjunction with Ribera and Carracciolo he obtained a complete ascendancy, which he accomplished partly by his ability, partly by dissimulation, and partly by violence. Corenzio, Ribera, and Carracciolo are said to have formed a triumvirate, whose object was to control all the great undertakings in paintings in Naples, and to allot his portion to each; and it is added that they did not scruple to resort to the most violent measures to remove the rivals whom they failed to intimidate. Corenzio, though not to be compared with Tintoretto, possessed nearly equal boldness of manner and facility of execution, and he was also little inferior to him in invention. He was an able colourist in oil, but he took little pleasure in that style; his ambition was to paint great works in fresco, and he executed many at Naples. In the number of his frescoes he has been equalled by few masters, and by still fewer in their extent; he could execute in a single day as much work as would occupy four painters of ordinary efficiency in the same time. One of his best and greatest works, the 'Feeding of the Five Thousand,' in the refectory of the Benedictines, occupied him only forty days. He died in 1643, at an advanced age: he was repairing one of his frescoes, when he fell from the scaffolding and was killed. (Dominici, *Vite dei Pittori*, &c.; Lanzi, *Storia Pittorica*, &c.)

CORINNA, a Greek lyric poetess, was a daughter of Archelodorus or Achelodorus and Procratia, and was born at Tanagra in Boeotia. As she resided during some period of her life at Thebes, she is sometimes called a Theban. She bore the surname Myia (*μυία*, a fly), and is often spoken of under this name alone. She lived about B.C. 500, as we must infer from the persons with whom she was connected, and was a woman of unusual beauty. She is said to have been a disciple of the poetess Myrtis, and to have herself instructed Pindar in his youth; but afterwards to have contended with him in poetical contests, and to have gained five victories over him. She appears at any rate to have exercised a very great influence upon the development of Pindar's youthful genius, and to have recognised his extraordinary powers; for she is said to have blamed Myrtis for venturing to enter into competition with him. The poems of Corinna were collected and divided (probably by the grammarians) into five books, and in addition to this collection we have mention of epigrams and lyric gnomes. But not one entire poem of hers has come down to us, and only a very few fragments are extant, which scarcely enable us to form an idea of their merit. Her great reputation however is attested by the statues which were erected to her in several towns of Greece, and by the prominent place which the Alexandrine critics assigned to her among the lyric poetesses. She wrote in the Æolic dialect, which however was interspersed with many Boeotian peculiarities. Her poems moreover appear to have been principally intended for Boeotians; for they abounded in allusions to Boeotian localities. From the fragments extant we must infer that the subjects of some of her poems were traditions about mythical heroes, and as in addition to this we are told that she wrote *ἑῶν*, we might suppose that she also composed epic poetry, but we know from Hephæstion (p. 22, ed. Gaisford), that these *ἑῶν* were contained in the fifth book of her poems, and that they were choral odes or hymns in the heroic or epic verse. The fragments of Corinna's poems are collected in F. Ch. Wolf's 'Fœminarum I.X. Illustrium Fragmenta et Elogia,' Hamburg, 1734, p. 42, &c.; in A. Schneider's 'Poetarum Græcorum Fragmenta,' Giessen, 1802, 8vo; and best in Th. Bergk's 'Poetæ Lyrici Græci,' p. 811, &c.

Suidas, in his article 'Corinna,' mentions two other lyric poetesses of the name of Corinna, the one of Thebes or Corinth, and the other Corinna the younger of Thebes, who was surnamed Myia. But these two are otherwise unknown, and it is generally supposed that Suidas is blundering in his usual way, and has made three persons out of one.

(F. G. Welcker in Crœuser's *Meletemata*, vol. ii. p. 1, &c.; Bode, *Geschichte der Hellenischen Dichtkunst*, vol. ii. part 2, p. 115, &c.)

CORIOLANO, the name of three celebrated engravers, chiefly in wood, in chiaroscuro.

CRISTOFORO CORIOLANO, the earliest, appears to have been a German and a native of Nürnberg, whose name, Doppelmayer supposes, was Lederer, but having settled in Italy he translated it into Coriolano. He cut, besides many other works, the very clever portraits in the second edition of Vasari, which was published at Florence in 1568. He died, according to Doppelmayer, in Venice, in 1600.

GIAMBATTISTA CORIOLANO, the next in point of time, was born at Bologna, and is supposed to have been the son of Cristoforo, but from the dates upon his works, 1619-25, that of grandson is a more probable relationship; he died in 1649. He was the pupil of G. L. Valesio, and was painter, and engraver on copper and on wood; but he painted very little, and his cuts in wood are very few; his works consist chiefly of engravings and etchings on copper, of which Bartsch describes 223, among which are several after the Caracci and other celebrated Bolognese painters.

The most celebrated of this name was the Cavaliere BARTOLOMEO CORIOLANO, who is likewise said to have been the son of Cristoforo, but the statement in this case is still more doubtful than in that of Giambattista, for the earliest date on his works is that of 1627, twenty-seven years after the death of his reputed father, who must have been of a considerable age when he died, as he was employed by Vasari in 1563. Bartolomeo was made Cavaliere di Loreto by Pope Urban VIII., for some prints after Guido, which he presented to his holiness: from this event he always wrote Eques after his name upon his prints. He was one of the best of the Italian wood-engravers, and has executed some very effective prints in chiaroscuro, after Guido and the Caracci; some with three and some with two blocks. The 'Fall of the Giants,' after Guido, 1638, is one of his principal works; it is in four sheets, which together measure 32 inches high by 23 inches broad. The latest date to which his signature is found is 1647. His daughter, Teresa Maria, painted and engraved some few works.

(Doppelmayer, *Historische Nachricht*, &c.; Gandellini, *Notizie storiche degli Intagliatori*, &c.; Bartsch, *Peintre Graveur*; Brulliot, *Dictionnaire des Monogrammes*, &c.)

CORIOLANUS, CNÆUS MARCIUS, the hero of an ancient Roman legend, belonging to the latter half of the third century of the city. Dionysius calls him Caius; but Dion and most of the manuscripts of Livy are in favour of Cnæus. (Niebuhr, 'Hist. of Rome,' vol. ii. p. 234, Eng. Transl.) The surname Coriolanus was supposed, in later times, to have been derived from his conquest of Corioli; but it probably rose in the same way as a multitude of other Roman surnames, such as Sabinus, Anunicus, Viscellius, &c., which only indicate the origin of the houses which bore them. A similar connection might no doubt be satisfactorily traced in many more cases if the names of the towns remained to justify our conclusions. (Niebuhr, vol. ii. p. 242.) The story of Coriolanus, as given by the Roman historians, is so completely poetical in its form, and so rhetorical in its details, that Niebuhr (p. 242) is of opinion that almost the whole of it must be excluded from history. The tale however runs as follows:—

Coriolanus was in the Roman camp when the consul Cominius was laying siege to Corioli. The besieged making a vigorous sally, succeeded in driving back the Romans to their camp; but Coriolanus immediately rallied them, rushed through the gates, and took the place. Meantime the Antiates had come to relieve the town, and were on the point of engaging with the consul's army, when Coriolanus commenced the battle, and soon completely defeated them. From this time he was greatly admired for his warlike abilities, but his haughty demeanour gave considerable offence to the commonalty. Not long afterwards his implacable anger was excited by being refused the consulship; and when, on occasion of a severe famine in the city, corn was at last brought from Sicily (some purchased and some given by a Greek prince), and a debate arose whether it should be given gratis or sold to the plebs, Coriolanus strenuously advised that it should be sold. The people in their fury would have torn him to pieces had not the tribunes summoned him to take his trial. He was banished by a majority of the tribes, and retired to Antium, the chief town of the Volsci, where the king, Attius Tullus, received him with great hospitality. Coriolanus promised the Volsci his aid in their war against Rome, and they forthwith granted him the highest civil honours, and appointed him their general. He attacked and took many towns; among others Grem, Saturnium, Longula, and Lavinium. At last he directed his march to Rome itself, and pitched his camp only a few miles from the city, where he dictated the terms at which the Romans might purchase a cessation of hostilities. Among other things he demanded that the land taken from the Volsci should be restored, that the colonies settled there should be recalled, and that the whole people should be received as allies and citizens with equal rights; and that all those who had enlisted themselves under his banners should be recalled, as well as himself. Coriolanus allowed them two terms, one of thirty and the other of three days, for making up their minds. After thirty days had expired, a deputation of four leading senators came before his tribunal, but were repulsed with threats if they should again offer anything but unreserved submission.

On the second day, the whole body of priests and augurs came in their official garb and implored him, but in vain. On the third and last day which he had allowed them he intended to lead his army against the city, but another expedition was tried, and succeeded. The noblest matrons of the city, led by Veturia, the mother of Coriolanus, and his wife Volumnia, who held her little children by the hand, came to his tent. Their lamentations at last prevailed on his almost unbending resolution; and, addressing his mother, he said with a flood of tears, "Take then thy country instead of me, since this is thy choice." The embassy departed; and, dismissing his forces, he returned and lived among the Volsci to a great age. According to another account, he was murdered by some of the Volsci, who were indignant at his withdrawing from the attack.

After his death however the Roman women were mourning for him as they had done for some former heroes. The public gratitude for the patriotic services of Volumnia were acknowledged by a temple, which was erected to Female Fortuna. Shakspeare has founded his play of 'Coriolanus' on certain parts of the legend.

(Dionysius Halicarnassensis, viii.; Plutarch, *Life of Coriolanus*;

Livius, ii. 83-40; Florus, i. 11; Niebuhr, *Hist. of Rome*, vol. ii. pp. 234-243.)

CORMENIN, LOUIS MARIE, DE LA HAIE, VICOMTE DE, a celebrated French political writer, was born at Paris, January 6, 1788. The son and grandson of officers of high rank in the public service, M. de Cormenin received a careful training for public life, though as the colleges were closed during much of his youth, his education was necessarily a private one. The law was his professional study, and at the age of twenty-two he was appointed by Napoleon I. auditor, or secretary, of the council of state; and during his continuance at the council was charged with the drawing up of some of its most elaborate reports. In 1828 he was elected deputy, and for some twenty years he continued to be re-elected, on several occasions more than one and sometimes as many as four departments contending for the honour of being represented by him. Very soon after his taking his stand as a public man, M. de Cormenin began to exercise a marked influence upon public affairs. His great knowledge of jurisprudence, his intimate acquaintance with administrative matters, his clear logical method, and admirable style of writing as well as speaking, gave him immense power; and the frequency and decision with which he placed his views before the public by means of pamphlets—always a favourite class of works with Parisians, and indeed with educated Frenchmen generally—greatly helped to maintain him prominently before the public eye. In fact, as M. de Lyden observes ('Nouv. Biog. Gen.' art. 'Cormenin'), "M. de Cormenin is as much the pamphleteer of the reign of Louis Philippe, as Sieyès was of the Revolution and Paul Louis Courier of the Restoration, with the difference that Courier is somewhat more caustic and M. de Cormenin more logical." After the first year or two of the reign of Louis Philippe, M. de Cormenin became the most bitter opponent of the policy of the Citizen King; and the effect of his trenchant pamphlets was sometimes very remarkable. One upon 'Apapages' is said not only to have led to the withdrawal of the projected law, but to the resignation of the Molé ministry: it was entitled 'Un Mot sur la Liste Civile,' and rapidly ran through twenty-five editions. His pamphlets against the encroachments upon religious liberty also had a great success: the first, 'Oui et Non' (1845), excited a remarkable turmoil, and called forth numerous answers, besides a demand from a portion of his constituents for a retraction. He replied by a second pamphlet of a still more biting character, 'Feu! Feu!' of which 60,000 copies were quickly sold. Another, which excited much public attention, was his 'Ordre du Jour sur la Corruption Électorale,' which forcibly exposed that shameless evil. After the revolution of 1848, being elected by four departments to the Chamber, M. de Cormenin diligently set himself to the task of remodelling the constitution, and was named president of the commission appointed for that purpose. In this commission he strongly urged the adoption of universal suffrage, and the maintenance of the legion of honour: but he soon resigned his presidency. He continued actively employed during the next two years promoting in the legislative assembly, in committees, and by pamphlets, his views on various social subjects, as the condition of the working classes, education, &c.; and he also published two pamphlets 'Sur l'Indépendance de l'Italie.' After the coup-d'état M. de Cormenin was appointed a member of the council of state reconstituted by Napoleon III.

Besides his numerous pamphlets, of which it may fairly be said that they were directed to no party end, but to the furtherance of administrative reform and social progress, M. de Cormenin is the author of a most important work on the administrative law of France, 'Droit Administratif,' in 2 vols. 8vo, of which a fifth edition was published some years back; and he has written a remarkably interesting series of sketches of the public life of the leading French orators from Mirabeau to Ledru Rollin, entitled 'Le Livres des Orateurs,' 2 vols. 8vo, of which the seventeenth edition was published in 1854. It is by these two works that his literary rank will be determined, and the place will be a high one. He is a man of extensive knowledge, great reasoning power, keen wit; and these he sets forth in a style of admirable force and clearness. M. de Cormenin received his title of vicomte from Louis XVIII.

CORMONTAINGNE, LOUIS DE, born about 1696, was a French engineer, who distinguished himself both by the services which he performed in the field and by the improvements which he made in the art of fortification. He was present as an engineer at the sieges of Landau and Fribourg in 1713; and three years afterwards he addressed a Memoir on Fortification to M. le Pelletier de Souci, who at that time held the rank of Intendant Général des Fortifications de France. In 1734 he was appointed by the Comte, afterwards the Maréchal Duc de Bellisle, to direct the siege of Traarbach; and when the division which performed that service rejoined the main army he accompanied it; the siege of Philipsbourg being then undertaken. Cormontaigne was employed to superintend the operations; and it is said that his successful attacks on two of the works were the immediate cause that the place was surrendered.

In the year 1744 he conducted, in Flanders, the sieges of Menin, Ypres, La Knoque, and Furnes; and, in Germany, that of Fribourg; at this last siege, though the casualties among the engineers were very great, the operations were conducted under the directions of Cormontaigne with the utmost regularity; and it is stated, as an example of the precision with which he formed his plans, that all the operations

on the ground were exactly conformable to the written instructions which he drew up and to the sketches which accompanied them.

Subsequently to that time he was employed in inspecting the fortifications of the kingdom, from the Rhone to Calais; and, on this occasion, besides a general tract on the manner of fortifying the frontiers of a state, he wrote particular memoirs on the places of Franche Comté, Alsace, and the country between the Moselle and Calais. He was afterwards employed in superintending the constructions of new works at Strasbourg, Metz, Bitche, and Thionville: at the last of these places he resided, with the rank of Maréchal de Camp, and here his useful life terminated.

Cormontaigne wrote several memoirs relating to fortification and other branches of the military art; and that which is on the subject of the attack of fortresses, is said to have been composed, during the siege at which he served, from notes written in the trenches and on the breaches, even under the fire of the enemy. None of his writings were published during his life, except one which, without his knowledge, was printed at the Hague in 1741, under the title of 'Architecture Militaire'; and after his death, which occurred on the 20th of October 1752, all his papers were deposited in the Bureau de la Guerre, where they remained above thirty years. Extracts from them were however published, and these served as text-books for the lectures given at the Ecole du Génie, which was established at Mézières in 1750. The manuscripts were at length obtained by M. Fourcroy from the government offices, and were published at Paris by M. Bayart, capitaine du génie, in three volumes 8vo. The first is entitled 'Mémorial pour l'Attaque des Places' (1806); the second, 'Mémorial pour la Défense des Places' (1806); and the third, 'Mémorial pour les Fortifications permanentes et passagères' (1809). An edition of the first of these works had been published by Bousmard at Berlin in 1803. Cormontaigne did not profess to invent a system of fortification; but, by certain variations in the constructions, and by additional works, he obviated many defects which are conceived to exist in the systems of Vauban.

(Bousmard's account of Cormontaigne in the Preface to the *Mémorial pour l'Attaque des Places*; *Biographie Universelle*, &c.)

CORNARO, LUIGI, a Venetian nobleman, celebrated for the successful care he took of his health, by means of diet, was born about 1468. He was originally of a weak constitution, and by the time he had attained mature manhood his intemperate indulgence in eating, drinking, and other pleasures, had brought on so many disorders that life was a burden to him. He informs us, that from his thirty-fifth year to his fortieth, he spent his nights and days in almost unremitted suffering. Having tried all their other remedies in vain, his physicians earnestly recommended a more temperate course of life, and when he was forty he began gradually to diminish the quantity of his food, and to eat and drink nothing but what nature required. At first he found this severe regimen very disagreeable, and he confesses that he did occasionally relapse to "the flesh-pots of Egypt." But as each of these relapses brought back his old symptoms, he soon exerted all his resolution, and by a spare and simple diet became a hale man within a year. From temperance he proceeded to abstemiousness, until at last the yolk of an egg was often considered sufficient for a meal. His health and spirits kept improving all the while, and as for enjoyment in eating, he says he brought himself to relish dry bread much more than he had ever done the most exquisite dainties of the table. At the same time he carefully avoided heat and cold, over-fatigue, late hours, sexual excesses, and all violent passions of the mind, having fully ascertained that nothing is more destructive of health and longevity than an indulgence in ambition, envy, hatred, and the like. Melancholy was to be equally avoided, but from this depressing passion his light food and peaceful slumbers kept him wholly free. He recommended, by practice, exercise, riding on horseback, the sports of the field, and those gentle excitements derivable from fine scenery in the country, the contemplation of architectural and other works of art in towns and cities, and the hearing and playing of music.

He records of himself, that when he was a very old man he used often to sing with his grandchildren, and that too with a voice louder and clearer than when he was a young man. When he was seventy years old he suffered a dreadful accident, by which his head and body were battered, and a leg and arm dislocated. Considering his advanced age, the physicians thought these injuries must speedily prove fatal, but after his limbs had been set, he recovered under the slightest medical treatment, and without experiencing any fever. Hence he inferred that a life of strict temperance is a safeguard against the ill effects that generally follow such accidents. When he was about seventy-eight, the quantity of nourishment he took in the twenty-four hours was, of bread, light meat, yolk of egg, and soup, twelve ounces in all; of wine, fourteen ounces; and these were portioned out into four separate meals. By the advice of his medical friends he then added two ounces to his solid food, and two ounces to his wine; but this trifling increase was soon given over, as it destroyed his ease and vivacity, and made him peevish and melancholy. In his eighty-third year he wrote his treatise 'Of the Advantages of a Temperate Life.' He subsequently added three other discourses on the same subject, the fourth and last being included in a letter to Barbaro, the patriarch of Aquileia, to whom he states, that at the age of ninety-five, he is still in possession of health, vigour, and the perfect use of all his faculties.

Cornaro died at Padua in 1566, when, according to the best authorities, he was ninety-eight years old. His work was very frequently published in Italy, both in the vernacular tongue and in Latin. It has been translated into all the civilised languages of Europe, and was once a most popular book. There are several English translations of it, the best being one which bears the date of 1779. Cornaro's system has had many followers. The best authenticated case we know of its being rigorously and successfully pursued in England is that of Thomas Wood, a miller of Billericay in Essex, to whom a neighbouring clergyman lent the 'Life of Cornaro.' ('Medical Transactions of the College of Physicians.') The old Venetian does not insist on such extreme abstinence as he practised—both the quality and the quantity of food, he says, ought to depend on the constitution; but he is probably right in hinting that men of all constitutions shorten their lives and weaken their enjoyments by over-eating and drinking.

CORNEILLE, PIERRE, was born in the year 1606, at Rouen, where his father was an advocate. Pierre himself was destined for the bar, and had begun to practise in that profession, in which however he had but little success. Having been taken by one of his friends to see a lady of whom the latter was enamoured, he fell violently in love with her himself, an incident which furnished him with the plot of his first comedy, 'Milete,' produced in 1629, which was followed by the dramas of 'Clitandre,' 'La Veuve,' 'La Galerie du Palais,' and 'La Place Royale,' all produced between that time and 1636, the year in which Corneille's fame rose at a bound to its height. M. Chalon had recommended him to study the Spanish dramatists, particularly Guillen de Castro; and it is on the 'Cid' of this author that the celebrated 'Cid' of Corneille was principally founded. This piece delighted the Parisians to enthusiasm; they had seen nothing equal to it, and they looked on it as a complete miracle. The author had before exhibited some tragic power in a work entitled 'Medée,' but it is not till the production of the 'Cid' that we must look on him as "le grand Corneille." But the admiration was not unanimous. Cardinal Richelieu aspired to be the grand arbiter in matters of dramatic taste, and Corneille had deeply wounded his sensitiveness. He had sketched the plan of a comedy, with which Corneille, although a poet patronised by the cardinal, had the hardihood to find fault, and this produced a lasting hostility on the part of the priest-prime-minister against the dramatist. The French Academy, which was founded by Richelieu, was disposed to abate the general enthusiasm. They (or rather Chapelain) wrote an elaborate critique on the 'Cid,' in which they ventured to point out some defects, while they allowed the poet genius of the highest order, and rather found fault with the subject of the drama than Corneille's manner of treating it. This critique is in most editions of Corneille's works affixed to the tragedy of the 'Cid,' under the title of 'Sentimens de l'Académie Française sur la Tragi-Comédie du Cid.'

Corneille felt himself hurt by an imputation cast upon his inventive powers; it was hinted that he borrowed his plot from the Spanish, because he had not imagination enough to contrive a new one. He long sought for a subject which should silence these aspersions of his enemies, and at last turned his attention to Roman history, from which he drew the plots of his tragedies 'Horace' and 'Cinna,' both produced in 1639. The 'Horace' fully proves his ingenuity in moulding a complicated story out of scanty materials.

These were followed in 1640 by 'Polyeucte,' founded on the history of the martyr of that name, which by some is reckoned his chef-d'œuvre, and which is by most regarded as the turning-point of his genius. His future was a slow but sure decline. 'La Mort de Pompée,' and 'Le Menteur' (an adaptation of the Spanish comedy 'La Sopechosa Verdad') succeeded, and were followed by a train of pieces with varying success till the year 1653, when the tragedy of 'Pertharite' was produced, and was decidedly unsuccessful. This misfortune disgusted Corneille for a time with the stage; he turned his attention to other kinds of poetry, and began to versify Thomas à Kempis, 'De Imitatione Christi.' Six years wore off his disgust, and he returned to the drama: the success of 'Edipe,' produced in 1659, encouraged him to go on. He even made an essay at opera-writing, and the 'Toison d'Or' remains a specimen of what he has done in that species of composition. The success of this piece was decided, but it was only the flame of an expiring lamp; in vain he wrote fresh tragedies, in vain did his friends laud them to the skies; the public began to suspect that his genius was worn out, and he had ceased to be popular before the production of his last pieces, 'Pulchérie' (1672) and 'Surenas' (1674). His latter works have sunk entirely into oblivion. He died in the year 1684, at the age of seventy-eight, having been a member of the Académie thirty-seven years. In private life he was a quiet domestic man, with a bluntness of manners that was almost repulsive. If we may trust his biographers, he had a few small faults, but no vice; his whole pleasure was centred in his own family. He and his brother had married two sisters, and resided together in one house, till death separated them.

It was, we have seen, by the 'Cid,' that Corneille first rose into celebrity; two or three passages of his 'Medée' are occasionally quoted, to show the development of a young poet, but as a whole it is forgotten, and probably would never have been cited, had not its author distinguished himself by his subsequent productions. His early comedies have sunk deservedly into oblivion, being dry, tedious

pieces of declamation, without point, and founded on a false morality; their only redeeming merit is ingenuity of construction.

If we now peruse the 'Cid,' we shall be at a loss to discover the cause of that enthusiasm which its appearance created in France, when, as it is said, all Paris saw Chimène (the heroine) with the eyes of Rodrigue (the hero). But it must be remembered that the French stage was in a wretched state before the appearance of Corneille; the pieces of his predecessors were for the most part dull and heavy, and without the slightest attempt at delineation of character. The chief fault found with the 'Cid' by contemporary critics was the selection of the subject. Don Rodrigue, to revenge a blow given to his father, kills the father of Chimène, his mistress, in a duel; she at first makes every effort to accomplish his death, but at length, at the request of the king of Spain, marries him. It is the contention between love and duty in the heart of the heroine which is the leading feature of the drama. The Aristarchus of the 'Académie' called the lady a monster of filial impiety, and said that she had no right to love Rodrigue at all; the opposite party contended that the preservation of her early love under all circumstances, was perfectly amiable and feminine. This literary battle indeed seemed rather to be fought for the morals of the heroine than the merits of the play. Those who would wish to read the charge and its answer may turn to the 'Examen' above referred to, and La Harpe's 'Cours de la Littérature.'

The other most celebrated piece of Corneille's is 'Horace,' the last act of 'Cinna' being reckoned a chef-d'œuvre rather than the whole play. Fontenelle's praise of 'Horace,' for the ingenuity of its construction, is unquestionably just. "Corneille," says he, "has but a combat to work upon, that of the Horatii and Curiatii, and out of this scanty subject he constructs a tragedy." The prospect indeed was but barren, yet the tragedian, by giving Horatius a sister of the Curiatii to wife, while his own sister is (according to the old story) betrothed to one of these Curiatii, and by dwelling on the times immediately preceding and pending the combat, has thrown an interest into his piece which was scarcely to be anticipated. Here indeed his praise ends, for the last two acts are occupied by the murder of Horatius's sister, and its consequences; hence, as La Harpe justly observes, they form a separate plot, totally unconnected with the preceding part of the play. The father of Horatius, as an illustration of the stern Roman character, is the most commended by the admirers of this tragedy.

The general censure passed on Corneille's comedies does not extend to 'Le Menteur,' which is one of his later productions, and is an excessively humorous and amusing piece. The English know it well from Foote's version, the 'Liar;' but it was introduced into this country long before the time of Foote, an anonymous translation having been acted in 1685, under the name of the 'Mistaken Beauty,' and a subsequent adaptation was written by Sir R. Steele, called the 'Lying Lover.'

The chief merit which is assigned to Corneille by his admirers is his dignity: they allow that Racine may be more elegant, more touching, but in a 'noble ferocity' they say that Corneille stands alone. It must be remembered that when Corneille wrote, the French tongue was still in an uncultivated state; he must not therefore be taken as a model of French style, his verse being often defective, and his language disfigured by barbarisms.

Voltaire, on learning that a great-niece of Corneille was entirely without fortune and almost without friends, took her into his house at Ferney, where she completed her education, and in a few years was married by Voltaire to a captain of dragoons. Besides giving her a marriage-portion, Voltaire undertook to write a commentary on Corneille, for the benefit of his protégée. The work, which was printed by subscription, and liberally patronised by the French king, the Duc de Choiseul, Madame de Pompadour and others, brought in 50,000 francs, as an addition to the young lady's marriage-portion. Voltaire, though a great admirer of Corneille, was not blind to his numerous faults, which he has pointed out at full length in his 'Commentaries' in two vols., 8vo (vols. xlviii. xlix.). Edition of Lequien, Paris, 1826.

CORNEILLE, THOMAS, brother of Pierre, was twenty years younger, being born in the year 1625. He distinguished himself in early life by a comedy in Latin verse, which he composed during his education at the Jesuits' College. Like his brother, he began by imitating the Spanish dramatists, and in the course of his career produced no less than forty-two pieces, tragedies and comedies. Nothing could exceed the popularity of some of his plays, which however was but transient, as they have, with about two exceptions, been long forgotten. The works by which he is chiefly remembered are 'Le Comte d'Essex,' and 'Ariane,' both tragedies. The former is much censured for the ignorance which it displays of English history. The latter is commended for the character of its heroine; here however its merit ends, the rest of the *dramatis personæ* being mere nullities. On the death of his brother, Thomas Corneille took his place in the Académie, and contributed to the 'Dictionnaire.' He also assisted his friend De Vise in editing the 'Mercurie Galant,' a noted periodical, and became a member of the Academy of Inscriptions. He died at Andelys in 1709, having shortly before lost his sight.

* CORNELIUS, PETER VON, was born at Düsseldorf, September 16, 1787. His father, who was inspector of the picture gallery in that city, gave him a superior education, and encouraged the boy's early

passion for art. But he died when young Cornelius was in his sixteenth year, leaving his family in straitened circumstances; and as their maintenance would necessarily devolve upon the future painter and an elder brother, his mother was strongly urged to place him with a goldsmith, that trade promising, it was said, a quicker and more certain means of obtaining a livelihood. His mother however resolutely refused to remove him from his chosen profession, and the young artist pursued with redoubled zeal his darling studies. He had in the academy of his native city been instructed in the principles of design, and he now devoted himself especially to the study of the works of Raffaele, exercising himself by reproducing from memory the compositions which he saw of that master either in the originals or engravings. He was soon able to produce designs of his own which manifested no ordinary power, and when he was only nineteen years of age he was employed to paint the cupola of the old church of Neuss, near Düsseldorf, with figures of colossal size in chiaroscuro; and the work displayed considerable grandeur of conception.

Having removed to Frankfurt, he there, in 1810, commenced a series of designs illustrative of the Faust of Göthe, to whom he dedicated the engravings. These designs gained him a high reputation; but his views of art were now greatly expanding, and he resolved to proceed to the metropolis of art, there to bring his ideas into comparison with the chief productions of the greatest masters. At Rome he united himself in the closest friendship with a kindred genius, Frederic Overbeck, and the two men looking forward to the regeneration of German art,—a work they were destined to accomplish,—lived and laboured together, while they were elaborating their lofty project. They were joined by Philip Veit, Schadow, Schnorr, and other not unworthy associates; and the new German school fixed on itself the attention of the artists and connoisseurs of Rome, while the friendly criticisms of Schlegel, Göthe, and others, ensured for it the sympathies of their countrymen. Fitly to embody their designs, the young painters arrived at the conclusion that only fresco—the material of the giants of old whom they sought at least to emulate—was a suitable material. They accordingly diligently applied themselves to acquire mastery over the almost forgotten art, and M. Bartholdy, the Prussian consul-general, afforded the desired opportunity of testing their power, by commissioning the leading members of the school to paint the walls of his villa. To Cornelius two of the frescoes were assigned—'Joseph interpreting the Dream of Pharaoh's Chief Butler,' and 'Joseph recognising his Brethren.' These paintings excited so much admiration, that the Marquis Massini commissioned Cornelius to adorn his residence with a series of frescoes from the 'Divina Commedia' of Dante. Cornelius prepared the designs, but before he could commence the paintings he received an invitation from the Crown Prince of Bavaria, afterwards King Ludwig, to execute the frescoes in the newly-erected Glyptothek at Munich; and at the same time he was appointed Director of the Academy at Düsseldorf. The designs for the villa of Massini, though never painted, were engraved by Schoefer, and published with a commentary by Döllenger; and another elaborate series of designs illustrative of the Niebelungen Lied, also made during his residence in Rome, was engraved by Amaler and Lipa. Later in life the great German painter made a series of designs from the 'Jerusalem Liberata' of Tasso.

Cornelius left Rome in 1819. His first duty was to remodel the Academy of Düsseldorf, and that accomplished, he proceeded to his great work of painting the Glyptothek—one of the noblest opportunities which had in recent times been afforded to a painter. Two spacious halls were given him to paint: in one, the Hall of Heroes, he represented in colossal proportions the leading events in the 'Iliad' of Homer; in the other, the Hall of the Gods, he endeavoured to symbolize the inner meaning as well as to depict the outward aspect of the events of the Grecian mythology. In connected rooms, subsidiary events and ideas were illustrated. It was in this vast undertaking, which was completed in 1830, that the genius of Cornelius first found ample room to expatiate; and the completed work has now for a quarter of a century commanded the homage of the artists and judges of art of all nations.

Whilst this great undertaking was in progress, Cornelius had commenced another magnificent work, the painting with frescoes the walls of the new Ludwig-Kirche. Of these frescoes the most important was the 'Last Judgment,' a painting which in size exceeded even the famous 'Last Judgment' of Michel Angelo in the Sistine Chapel, being no less than 64 feet high by 80 feet wide. In severity of style also it exceeds that great work; and if it may not be put into close comparison with it as a picture, there can be little doubt that among contemporary paintings it is without a rival. The execution of these great works rendered constant residence in Munich necessary, and Cornelius resigned the directorship of the Düsseldorf Academy as soon as he had brought it into a satisfactory state. Shortly after doing so he was made director of the Munich Academy. Munich under him became a great school of art, and a band of devoted disciples placed themselves under his guidance. It was by these that a large portion of his frescoes in the Glyptothek and the Ludwig-Kirche was executed. The extensive series of frescoes illustrative of the history of painting, in the corridor of the Pinakothek, for which he prepared the cartoons, was wholly painted by Zimmermann, Schotthauer, and other pupils under his supervision.

In 1841 Cornelius was invited to Berlin by Frederic William IV. to paint some frescoes in the Campo Santo. He set about the work with his accustomed energy. Before completing his cartoons he paid a third visit to Rome, and there some of the designs were prepared. They showed no falling-off in grandeur of conception, devotional feeling, or profound knowledge of the resources and the limits of art. They are well known by engravings, having been engraved in eleven plates, with the remarkable cartoon of the 'Four Horsemen' of the Apocalypse as a twelfth, by Thämer, Leipzig, 1848. Cornelius also superintended the painting of the frescoes in the Berlin Museum, for which the cartoons had been prepared by Schinkel. The design for the baptismal shield presented by the King of Prussia to the Prince of Wales, was likewise made by Cornelius; as well as numerous other designs for his royal patron.

Cornelius is undoubtedly one of the greatest painters of the age. His works are on the largest scale, treat of the loftiest themes, and are designed with a grandeur and beauty befitting their magnitude and elevated aim. The mechanical execution of his works is often objected to by critics, and he certainly treats it as of very inferior consequence. His grand idea he seeks to evolve as strongly as possible, and to that he recklessly subordinates everything else. But his mind is so accustomed to regard his subject from a subjective and symbolical point of view, that his meaning is frequently somewhat difficult to perceive. No one however suspects that there is not a meaning, though it may be somewhat deeply hidden; and no one has studied the works of Cornelius without finding in them abundant matter to recompense the study.

CORNWALLIS, CHARLES, second Earl and first Marquis of Cornwallis, was born December 31, 1738, and educated at Eton, and St. John's, Cambridge. In 1761, during the Seven Years' War, he served abroad under the title of Lord Broome, as aide-de-camp to the Marquis of Granby. In 1762 he succeeded to the peerage on the death of his father, in 1766 he was made colonel of the 33rd regiment of foot, and in 1770 governor of the Tower. He was also aide-de-camp to the king, who held him in high favour; yet though a general supporter of the administration, he exercised an independent judgment, and voted against ministers on several important questions. More especially, he was opposed to the steps which led to the American war; but when his regiment was ordered abroad in 1776, he sailed with it, declining to profit by the special leave of absence obtained from the king. He served actively and with distinction, with the rank of major-general, under generals Howe and Clinton, in the campaigns of 1776-79 in New York and the southern states, and in 1780 was left in the command of South Carolina with 1000 men. He gained a victory over General Gates at Camden, August 16, 1780, and a second, less decisive, over General Greene at Guilford, March 15, 1781—both against superior numbers. But the hostility of the population rendered these advantages transient. In the course of the spring of 1781 Cornwallis invaded Virginia, where he obtained no decided success, but caused an immense amount of damage to private property. On receiving orders from Sir H. Clinton, then at New York, to embark part of his forces for New York, he moved to Portsmouth in Virginia; but here he received fresh instructions, under which he was ordered to Williamsburg, the colonial capital of Virginia, and directed to make Point Comfort his place of arms. But Point Comfort being found ill-suited for this purpose, Cornwallis moved to York Town on York River, where he entrenched himself in the strongest way he could. He was there besieged by the French and American forces, assisted by the French fleet under De Grasse, and reduced to surrender himself and his troops prisoners of war, after an obstinate defence, October 19, 1781. His capture was a death-blow to the British cause, and principally led to that change of ministers and measures which resulted in the peace of 1782: Cornwallis himself however, owing perhaps to his favour with the king, escaped censure.

In 1786 Lord Cornwallis was appointed governor-general and commander-in-chief of Bengal. His temper being mild and equitable, and his application to business constant and effective, he was honourably distinguished by a sincere desire to promote the welfare of our Indian subjects, and introduced a variety of internal changes, which were characterised by a great unfitness for the purpose they were intended to serve. His administration is chiefly remarkable for the war undertaken against Tippoo Saib [TIPPOO]. The disasters experienced at first by the English caused the governor to take the field himself, in 1791; and by a change in the quarter of attack, he succeeded in penetrating to the heart of Tippoo's dominions, and captured Bangalore in March. In the following February siege was laid to Srirangapatam, and the capture of that city was averted only by a treaty, which stripped the sultan of half of his dominions. In August 1793 Lord Cornwallis returned to England, where he was received with distinguished honours, raised to the rank of marquis, and appointed master general of the ordnance. In 1798 (the era of the rebellion) he was made lord-lieutenant of Ireland. In the distracted state of that country, a man of generous and conciliatory temper was even more needed than one of military skill. He put down the rebellion; but he also checked the disgraceful outrages practised by the supporters of government, restored tranquillity, and acquired the good-will of the Irish. In 1801 he was succeeded by Lord Hardwicke; and in the same year, being appointed plenipotentiary to France, he negotiated the peace of Amiens. He was re-appointed governor-general of India

in 1805, and arrived at Calcutta in August, in bad health. Proceeding immediately to assume the command of the army in the upper provinces, he was seized with illness, and died at Ghazapore, in the province of Benares, October 5, 1805. His character as a soldier and statesman was highly respectable; but he was more distinguished by diligence, humanity, and integrity, than by the higher mental qualities.

CORRADI, DOMENICO. [GHIRLANDAIO.]

CORREGGIO, ANTONIO ALLEGRI, or, as he has been known to write it, LIE' TO, one of the first of painters, surnamed Correggio from the place of his birth, a small town in the duchy of Modena, was born towards the end of the year 1493, or early in 1494. Correggio's life is involved in impenetrable obscurity. The only authentic records which exist are certain registered documents, public and private; but they serve only to throw a very feeble light upon his domestic life; our knowledge of it remains of a negative character. Some of his biographers, at the head of whom is Vasari, describe him as of humble origin, indigent, and penurious in his way of living; others like Mengs and Ratti draw his descent from a noble family of Correggio, once feudal lords of Campagnola and its castle in the Corregese. The truth appears to be that the Allegri family, from which Antonio descended, were a decent family of Correggio, while the conveyance and bequest of considerable property, including money, houses, and small portions of land, are too frequent among Antonio's immediate relations, to leave any doubt of his having been at least in easy circumstances. The statement of his having received very small sums for his pictures is also disproved by documentary evidence.

It is uncertain who was Correggio's first instructor. Francesco Bianchi, Lombardi, Tonino Bartolotto, and his uncle Lorenzo have been severally named as his instructors in the elements of his art; and it is added by some that he afterwards studied under the sons of Mantegna. Mantegna himself even has been supposed to be his first master; but the fact of Mantegna having died in 1506, when Correggio was barely twelve years old, renders it very improbable. In Mantegna's works however we may recognise the germ of that sweet and graceful style which Correggio carried to perfection. That Correggio ever went to Rome is far from probable, since a continued series of documents prove him to have been habitually residing in Correggio at the time when some writers have supposed he visited Rome. If he ever went there it must have been for a mere visit. The mastery with which he treats classical subjects, has given rise to the supposition that he received a liberal education, and there is no proof to the contrary. It is certain also that his works display a considerable knowledge of architecture; but that he practised that art, or sculpture, as some of his biographers have asserted, is entirely without proof. Correggio married, in 1520, Girolama Merlini, of a wealthy family in Mantua, and by her had a son and three daughters. She is said to have been the original in his picture of the Holy Family, known as 'La Zingarella.' The supposition that he married a second time probably arose from a mistake in a certain register, in which his wife's Christian name is misstated. He died on the 5th of March 1534, and was buried in the church of St. Francis at Correggio.

Correggio is one of the most original of painters, as well as one of the greatest of colourists. He formed a style completely his own, remarkable for masterly chiaroscuro, exquisite colouring, and the most graceful design. Less varied and decided in his outline than the painters of the Roman and Florentine schools, he is more anxious to dispose his lines in easy flowing curves than to display knowledge of anatomy or powerful drawing. Nevertheless, his forms are sufficiently correct, and the consummate skill shown in his endless foreshortenings proves that his smoother style of drawing was dictated by no want of study or deficiency of ability. While Titian's colouring is bolder, more varied, and more powerful than Correggio's, it is not so full of beauty and a certain mild and rich luxuriousness. There is the same difference between the two that there is between a bed of glowing flowers and a pulpy cluster of grapes laughing from under the vine-leaves. More studied in his use of light and shade than any of his brother painters, he gives to his pictures an air of space which mocks the limits of the frame; a depth and unity, the force of which Rembrandt alone has exceeded, and no one else approached; but the Flemish painter's sun never shines upon forms like the Italian's—it is mostly a "god kissing carrion." The expression which Correggio infuses into the lovely creations of his pencil is in harmony with the grace of his drawing, the pure sweet colouring, and the concordant tone of the picture. Avoiding harsh and unpleasant subjects, and delighting in the play of tender and voluptuous emotions, his mothers fondle their offspring, his children frolic and smile, his lovers pant and sigh, with all the ecstasy of unreprieved nature. If his beings are of a less mighty mould than Michel Angelo's, his colour less powerful in its tints, and his expression less passionate than Titian's, and if his design be less perfect and less exalted than Raffaele's, no artist has equalled him in gentleness and sweetness, and none calls forth the affections of the spectator in a more lively manner.

Correggio's pictures are not so numerous as those of some painters; but they are sufficiently spread over Europe for his style and fame to be universally recognised. The cupola of the cathedral at Parma is painted with an 'Assumption of the Virgin' in fresco, of which the

numerous beauties, the masterly foreshortening, the grace, the colour, and the design, so excited Titian's admiration, that he is reported to have said, "If I were not Titian, I would be Correggio." In the gallery at Dresden are the 'Notte,' or rather 'Dawn'—a grand picture on the subject of the Nativity, and a masterpiece of chiaroscuro—and a little cabinet picture, the 'Penitent Magdalen,' in which the saint is represented lying on the ground weeping. A blue mantle envelopes the form; the head, shoulders, bosom, and feet are bare; a shady nook enshines the saint. Her brow rests upon one hand, and a tender melancholy trembles on her lips. The soft features, the delicate bosom, the gentle arms, are of the rarest beauty. It is perhaps the most perfect woman ever painted. In our own National Gallery are three or four of his best pictures:—'Mercury instructing Cupid in the presence of Venus' (formerly in the possession of Charles I., who purchased it of the Duke of Mantua, and universally allowed to be one of the artist's masterpieces), and an 'Ecce Homo' (in which the Madonna is painfully true to suffering nature, but redeemed by his usual beauty of form and expression); these two pictures were purchased by the British government in 1831 of the Marquis of Londonderry for 10,000*l*. There is also a Holy Family, known as 'La Vierge au Panier,' and formerly in the Royal Gallery at Madrid—small in size, but of the most exquisite beauty. Another is 'Christ's Agony in the Garden,' a duplicate of the one in the possession of the Duke of Wellington. Two of the most celebrated of Correggio's pictures were destroyed, it is said, by order of the Regent Duke of Orleans, for the too great freedom of the design—the 'Danse' and the 'Jo'—a strange story for a man of his character. The former was pieced together again by Coypel; of the latter a duplicate still exists.

Correggio had many good pupils, among whom may be reckoned his son, who painted a fresco in the cathedral at Parma, which has been much commended. He abandoned painting however before he died. Parmigiano may be reckoned among the followers and imitators of Correggio, though not among his pupils.

(Tiraboschi; Vasari; Menges; Ratti; Lanzi, &c.)

CORT, CORNELIUS, a designer and very celebrated engraver, was born at Horn in Holland in 1536. He worked in his youth for Jerome Cock, a printseller of Antwerp. He then went to Italy, where in Venice he was received by Titian into his house, and engraved several of his pictures for him in (at that time) an unusually large size: they are dated 1566. Cort however settled finally in Rome, and established a school of engraving there, in which Agostino Caracci is said to have studied. This however is doubtful, as Agostino was only twenty years of age when Cort died, if 1578, as is believed from the letters on an old portrait, was the year of his death. The earliest prints of Agostino are dated 1582, four years after the death of Cort. That Agostino studied the prints of Cort, and to a great extent adopted him as a model, his works sufficiently evince. Cort's prints are large and his outline correct; they display great mastery of the graver, but a want of perception of the more delicate qualities, such as colour and relative distance; he was also deficient in discriminating the more delicate indications and varieties of expression. His works, for their size and style, and considering the comparative shortness of his life (forty-two years), are very numerous; they exceed 150. He made the first engraving after the 'Transfiguration' by Raffaele; he engraved also the 'Battle of the Elephants,' and the 'Battle of Constantine,' after Raffaele. He executed also several prints after Federigo Zuccaro, and others after Taddeo Zuccaro, G. Muziano, Polidoro da Caravaggio, Correggio, Michel Angelo, Sabbatini, and many other celebrated masters, Italian and Flemish; and likewise some from his own designs. (Gandellini, *Notizie Storiche degli Intagliatori*, &c.; Heincken, *Dictionnaire des Artistes*, &c.)

CORTES, HERNAN, was born in 1485 at Medellin, a village of Extremadura, in Spain. He was sent to study law at Salamanca; but being of a turbulent and dissipated disposition, his father wished him to go to Italy as a military adventurer under the Great Captain (Gonzalo). Not succeeding in this, he in 1502 obtained permission to follow his kinsman Ovando, who was appointed governor of Hispaniola; but an accident which befell him in scaling a lady's window prevented his joining Ovando till 1504. In 1511 he distinguished himself under Velasquez in the conquest of Cuba, and in 1518 was selected by this governor to undertake the conquest of Mexico, then just discovered by Grijalva. Accordingly, Cortes set sail from St. Jago de Cuba the 19th of November 1518, with ten vessels, ten pieces of cannon, eighteen horsemen, 600 infantry, thirteen only of whom were musketeers, and the rest cross-bowmen. He touched at various places, and among them at Havannah in search of more adventurers; and setting out again February 10th, 1519, bent his course to Cozumel, left that island on the 4th of March, and proceeded up the river Grijalva or Tabasco. Velasquez soon after he had despatched his lieutenant with the brilliant prospects of conquest, revoked his commission, and attempted to get him brought back under arrest; but the vigilance of Cortes frustrated all the schemes of the governor.

Having taken the town of Tabasco, with much slaughter, he received from its cacique gold and provisions, and twenty female slaves. One of these, who makes a great figure in the history of the conquest, under the name of Doña Marina, being a native of Mexico, became highly useful as interpreter, in conjunction with Jerome de

Aguilar, who had been eight years prisoner in the island of Cozumel. Advancing into the interior, Cortes met at San Juan de Ulloa some Mexican chiefs, who were anxious to know his intentions. Cortes laid great stress upon the importance of his mission from the great monarch of the east, and the necessity of his waiting upon their king. Native painters in the meantime were delimiting on cotton cloth the ships, horses, artillery, &c., of the ominous visitors, in order to acquaint their sovereign with the wonders which words could not describe. To awe them still more, Cortes displayed the evolutions of his men and horses, and the havoc made on trees by the terrific thunder and discharge of cannon-balls. Several of the terrified Indians fell to the ground, and so many ran away, that it was difficult to subdue their alarm and regain their confidence.

During the negotiations for his progress to the capital, Cortes founded the colony of Villa Rica de Vera Cruz, and defeated the faction of the partizans of Velasquez, who, in the midst of the expedition, were in full readiness to revolt. Not satisfied with this, to prevent all farther hesitation and division among his followers, by leaving them no other chance of safety than in union and the conquest of a hostile country in which he shut them up with himself, he deliberately broke his ships to pieces. Cortes moreover gained over the caciques who were impatient of the Mexican yoke. The cacique of Zempoalla implored his assistance, and furnished him with provisions and 200 Indians to carry burdens, an invaluable service in a country where beasts of burden were unknown. On arriving at the confines of the Tlascalans, Cortes was attacked by them, under suspicion of his seeking the friendship of the Mexicans, their implacable enemies; but after an incredible slaughter, 6000 of them joined the conquerors. With this reinforcement Cortes reached the territory of the Cholulans, who, being the ancient enemies of his new auxiliaries, refused to admit them into their holy city of Cholula. However in obedience to Montezuma's injunction, they received the Spaniards, but at the same time, according to the Spaniards, formed a plot against them. Cortes, anticipating their treachery, destroyed 6000 of them without the loss of a single soldier. The perplexity of the Mexican councils increased with the boldness of the invaders, who were now regarded as those descendants of the sun, destined by prophetic tradition to come from the east, and subvert the Aztec empire. Accordingly, on the 8th of November 1519, they were received at Tenochtitlan, the Mexican capital, as Teules, or divinities. Soon after however an attack was made by the natives, acting under secret orders, upon Vera Cruz, and the head of a prisoner was carried in triumph through the country up to the court, to disprove the immortality of the Spaniards. Cortes, on this, carried off the emperor Montezuma, or Montezuma, to his quarters, although he asserted his innocence, and offered to deliver up the chief aggressor. But Cortes demanding also the son of this officer and five officers more, had them all burnt alive in front of the imperial palace, on a pile made of the weapons which were kept in store for the defence of the state. During the execution, the emperor was loaded with irons. Subsequently he acknowledged Charles V. as his lord, but he constantly refused to embrace Christianity; and when Cortes led his soldiers to stop the human sacrifices and throw down the idols in the grand temple, both priests and people rose in arms and forced him to desist. After this provocation, the Mexicans became resolved to expel the Spaniards, and Montezuma, though a prisoner, assumed the tone of a sovereign, and ordered Cortes to depart.

After six months' occupation of Mexico, when the danger of the Spaniards had increased, 18 ships with 80 horsemen, 800 infantry, 120 cross-bowmen, and 12 pieces of artillery, were sent under Pamphilo de Narvaez by Velasquez against Cortes. Cortes, deriving fresh courage from his disappointment and indignation, persuaded Montezuma that he was going to meet his friends. Leaving him and the capital in charge of Pedro de Alvarado with only 150 men, he marched with 250 against Narvaez, attacked him in the dead of night near Zempoalla, made him prisoner, and with the new army hastened back to Mexico, which had revolted in his absence. Although he resumed his former position there, he had soon to maintain a desperate conflict, and to retreat for safety after Montezuma had perished in attempting to appease his subjects. This success of the Mexicans led to their total defeat in the battle which they fought and lost in the plain of Otompan, or Otumba, July 7, 1520. This victory enabled Cortes to subdue some of the neighbouring territories with the assistance of the Tlascalans, to attach 10,000 more of them to his service, to attack Mexico again six months after his retreat, and to retake it the 13th of August 1521, after seventy-five days of fierce and almost daily fighting. The natives once more reduced to despair rose again, and again they yielded to superior discipline, though on no occasion did native Americans so bravely oppose European troops. Thus a daring adventurer, regarded and treated by his countrymen as a rebel, after a bloody struggle, gained possession of a country which for more than three centuries formed one of the brightest gems in the Castilian crown. The atrocities of Cortes were of the most terrible and merciless character; but it has been pleaded in extenuation of them that he was a soldier by profession, and while the Inquisition burnt Jews and Protestants in Spain, he could learn from his chaplains no other or better means of converting heathens than by fire and the sword: and to a certain extent the plea may be admitted.

Indignant at the ingratitude of Charles V., who listened to his enemies, Cortes returned to Spain in 1528 to face his accusers. He was received with much respect, and made Marquis of the rich Valle de Oajaca; but in 1530 had to return to Mexico, divested of civil power. Being anxious, after his military exploits, to extend his fame by maritime discovery, particularly in the opening of a passage from the Atlantic to the Pacific, he fitted out at his own expense different expeditions, one of which discovered California in 1535, and he himself coasted next year both sides of the gulf of that name, then called the Sea of Cortes. He returned to Spain in 1540, when he was received by Charles V. with cold civility, and by his ministers with insolent neglect. He accompanied however this prince in 1541 as a volunteer in the disastrous expedition to Algiers, and his advice, had it been listened to, would have saved the Spanish arms from disgrace, and delivered Europe three centuries earlier from maritime barbarians. Envy and ill-requited by the court, Cortes withdrew from it, leaving sycophants and intriguers to reap the fruits of his labours and his genius. He died however in affluence near Seville, on the 2nd of December 1547, in the sixty-third year of his age. Cortes, with all his reckless cruelty, was unquestionably a man of remarkable genius—one of the heroes of Old Spain. The destruction of his fleet at Vera Cruz, with the object of compelling his followers to conquer or die—his fearless entry into Mexico—the still bolder seizure of Montezuma in his own palace—his defeat of Narvaes—his victory of Otumba—and his magnanimity in the siege of Mexico—are deeds which read more like romance than reality.

Robertson has estimated the character of Cortes at least as highly as his own countrymen—Bernal Diaz del Castillo, Gomara, Herrera, Solis, Lorenzana (who published in 1770 a 'History of New Spain,' founded on the only writings of Cortes, which consist of four letters to Charles V.), and Trueba. The valuable 'History of the Conquest of Mexico,' by Prescott, will supply the general reader with sufficient materials to estimate fairly the character and genius of Cortes.

CORTESE, JACOPO. [BOROGNONE.]

CORTONA, PIETRO BERRETTINI, called *Pietro da Cortona*, was born on November 1, 1596, at Cortona. His first master was Antonio Commodi, but he afterwards studied under Ciampi at Rome. Being employed by a gilder to make some little figures, his skill attracted the notice of the Marquis of Sacchetti, who visited the workshop, and Pietro was induced to show some of his paintings. The marquis took him at once under his protection, and procured him numerous commissions, and among them an order to paint some rooms in the palace of the reigning Pope Urban, in the Piazza Barberini. Cortona afterwards travelled, and executed various pictures by the way. He was employed by Ferdinand II. to paint some pictures in the Pitti palace, and stayed some time in Florence; but he left it in disgust, because the grand duke had listened to certain detractors, who had accused Cortona of palming his own pictures upon the prince in place of some of Titian's which Ferdinand desired to purchase of him. He settled finally at Rome, and enjoyed the patronage of successive pontiffs, until Alexander III. made him a knight. He died, oppressed with years and the gout, May 16, 1669, full of wealth and honour.

Pietro da Cortona studied the works of Raffaele, Michel Angelo, and especially those of Polidoro da Carravaggio, from whom he learned to imitate the style of the later antiques, taking for his immediate model the sculpture of Trajan's column. His style of drawing is free, bold, and vigorous, and even coarse; seldom finished in any except the most conspicuous parts. In design he is learned and masterly, though somewhat mannered and over-charged. His colour is sober and harmonious. His principal works are at Rome, in the Barberini and in the Sacchetti palaces; and at Florence, in the Pitti palace.

Cortona practised architecture as well as painting. He was buried in the church of San Martin at Rome, which is considered his best architectural work; and at his death he bequeathed to it a hundred thousand crowns. Cortona had many famous pupils; among them were Ciro Ferri, Romanelli, Giordani, Borgognone, and Testa. (Pascoli.)

CORYAT, THOMAS, "the Odombian leg-stretcher," as he was wont to call himself, was the son of the Rev. George Coryat, rector of Odcombe, in Somersetshire, and prebendary of York cathedral. Thomas, or, as he was usually styled, Tom Coryat, was born at Odcombe rectory in 1577, and was educated at Westminster School, and afterwards at Gloucester Hall, Oxford, where he remained three years, and acquired some skill in logic, and more in Greek and Latin. He seems, on leaving the university, to have obtained a post in the household of Prince Henry; but his eccentricity had probably already become marked, as he is spoken of as holding in the prince's establishment a position somewhat analogous to that of court-jester.

His father died in 1606, and Tom felt himself at liberty to indulge a "very burning desire," which he says had long "itched in him, to survey and contemplate some of the choicest parts of this goodly fabric of the world." Accordingly, in May 1608, he embarked at Dover, and travelled through France and as far as Venice, returning by way of Germany. Travelling on the continent was in those days at best somewhat laborious, but Coryat's was a more than usually arduous journey, for he went as far as possible on foot, and carried very little money in his pocket. He reckoned that in the five months he was absent he had travelled 1777 miles, of which he had walked

900, and the same pair of shoes sufficed for the whole journey. On his return he hung up his shoes for a memorial in Odcombe church, where they remained till 1702. Coryat was a diligent observer of all that he saw new to him in his travels, and an insatiable inquirer; and he made notes of everything which struck him as noteworthy. These notes he set himself on his return to arrange; and in 1611 he published them in a bulky quarto volume, with this strange title: 'Coryat's Crudities, hastily gobbled up in five months' Travels in France, Savoy, Italy, Rhetia, commonly called the Grison's Country, Helvetia, alias Switzerland, some parts of High Germany, and the Netherlands; newly digested in the hungry air of Odcombe in the county of Somerset, and now dispersed to the nourishment of the travelling members of this kingdom.' Appended to the volume were some sixty sets of verses, written, among others, by Ben Jonson, Chapman, Drayton, Donne, Sir John Harrington, Inigo Jones, and Lawrence Whitaker. They are written in Greek, Latin, Spanish, Italian, French, Welsh, Irish, 'Macaronic,' and 'Utopian,' and are all very quizzical, some coarsely so. As might be expected, these verses proved the most attractive part of the volume, and they were reprinted in a separate form under the title of 'The Odombian Banquet,' with an advertisement prefixed, intended more evidently than were the verses themselves to render poor Coryat ridiculous. Chalmers and others have supposed this volume to have been published by Coryat himself, and have expressed a good deal of surprise at the excess of his simplicity. So far however from writing the 'advertisement,' or even sanctioning the republication, Coryat in the 'Second Course' of his 'Crudities,' the 'Cramb, or Colwort twice Sodden,' makes in his way an energetic attack upon it. But the verses themselves were not attached to his book by his own free will. He expressly states that he was commanded to print them by Prince Henry, and he shows that he was quite aware of their real purpose. Poor Coryat was in fact evidently made the butt of the cleverer men with whom he was weak enough to desire to associate, and he was treated with as little generosity as the wits have in all ages treated their butts. Coryat's 'Crudities' are, as may be supposed, of little or no value for their descriptions of buildings and cities—the bulk of the book; but they contain many curious illustrations of the state of society in that time, and in them many odd scraps of information on many unexpected matters will be found stored up.

In 1612, the year following the publication of the 'Crudities,' Coryat departed on a more extended journey: his object being to visit the Holy Land, and walk from there to the East Indies, leaving the actual limits of his travels to be determined by circumstances. Having made a brief stay in Constantinople, he visited various parts of Greece and went to explore the vestiges of Troy, with which he was much delighted. He then went to Jerusalem, and among others of the sacred localities visited all he could discover of the Seven Churches. Thence he started to Aleppo, and so through Persia to Agra, where was the Mogul's court, spending, he says, in his "journey betwixt Jerusalem and the Mogul's court fifteen months and odd days, all of which way I traversed afoot . . . the total distance being 2700 English miles," and in ten months of this journey he only expended "betwixt Aleppo and the Mogul's court but three pounds sterling, yet fared reasonable well every way." Coryat had always a considerable aptitude for acquiring languages, and in this journey he had learnt to use colloquially Italian, Arabic, Turkish, and Persian, his attainments in which no doubt contributed to his easy and economic progress. From Agra he sent to his friends in London some brief notices of what he had seen on his way, with a description of the Mogul's court, which were published, with a portrait prefixed, representing him riding on an elephant.

At Agra he stayed some little while, being taken much notice of by the Mogul and by Sir Thomas Rowe, the English ambassador there. Of his future proceedings all that is known is told in the voyage of the Rev. Thomas Terry, chaplain to the ambassador. Terry says that Coryat, having stayed long enough to acquire "a great mastery in the Indostan, or more vulgar language," resolved to continue his journey, he having now so extended his plan as to propose to prolong his wanderings for at least ten years, in which time he hoped to be able to explore "Tartaria in the vast plains thereof, with as much as he could of China, and those other large places and provinces interposed betwixt East India and China," after which he intended not only to search for Prester John in Ethiopia, but to "cast his eyes upon many other places." But his journeyings were nearly ended. He set out for Surat, though ill before starting, and full of fear that he should die on the road. He lived to reach Surat, 300 miles distant, but died there of a dysentery a few days after his arrival, December 1617. Coryat made full notes during this journey, but they were all lost. The 'Crudities' has become a very rare volume, and fetches a high price at the book-sales.

COSMO THE ELDER. [MEDICI.]

COSMO I., duke of Florence, and afterwards grand-duke of Tuscany, was the son of Giovanni de Medici, a celebrated condottiere of the 15th century, who was descended in a direct line from Lorenzo, the younger brother of the elder Cosmo. This line formed a collateral branch of the first house of Medici, and its members remained in a private station as wealthy citizens of Florence during the lives of Cosmo, Pietro, Lorenzo the Magnificent, and Leo X., taking little part in the civil broils which agitated the republic under the administration

or influence of the elder branch. That branch became extinct by the death in 1519 of Lorenzo de Medici, duke of Urbino, the only legitimate grandson of Lorenzo the Magnificent, which was followed soon after by the death of his uncle, Pope Leo X. The Duke of Urbino left an illegitimate son, Alessandro, who was made Duke of Florence after the surrender of that city to the allied arms of Charles V. and of Pope Clement VII., in 1530. Alessandro was a prodigal prince, and after several years of tyranny was murdered by his relative Lorenzino, who belonged to the junior branch of the Medici, in 1537. Upon perpetrating this murder, Lorenzino fled to Venice. The friends and councillors of the late duke, with Guicciardini the historian at their head, proposed to appoint young Cosmo, of the younger branch of the Medici, as successor to Alessandro. Cosmo had against him a number of emigrants, some of the first families of Florence, who were hostile to the Medici, some through jealousy and rival ambition, and others because they wished to re-establish the republic. These emigrants were scattered about the different Italian cities, and were encouraged and supported by Pope Paul III., by Count Pepoli of Bologna, and others. They also relied on the protection of Francis I. of France, while Cosmo on his side was protected by the emperor Charles V., who acknowledged him as Duke of Florence. The emigrants, having collected a few thousand men, invaded the Florentine territory, but were defeated by the troops of Cosmo at Montemurlo; and their leaders Albizzi, Valori, and Filippo Strozzi, were taken prisoners and put to death. From that time Cosmo reigned absolute lord of Florence. He extinguished all remains of popular liberty, and he established a system of inquisitorial police by means of numerous informers. Persons accused of any designs against the government were tortured, and often put to death. He had agents also in various parts of Italy to watch the conduct of the Florentine emigrants, and in some instances to get rid of the most dangerous by assassination or poison, as in the case of Lorenzino, who was murdered at Venice by his order, in 1548. He effected a striking change in the manners of the Florentine people, who were before noted for their garrulity and lightness of conversation; they became henceforth taciturn and cautious, and spoke in half sentences. In other respects the administration of Cosmo was orderly and wise; he was attentive to business, and looked himself into all public affairs. He had considerable abilities; and if he rendered Florence and Tuscany entirely dependent on his will, he at the same time succeeded by consummate political skill in keeping his state independent of all foreign powers. Determined to be master at home, he freed his towns from the imperial garrisons, and resisted several attempts at encroachment from the court of Rome. He was the first to establish the unity and independence of Tuscany as a political state. He formed a native militia of the peasantry, well exercised and disciplined by experienced officers, so that at three days' notice he could collect 12,000 men in any particular point, besides the regular regiments which he kept in the towns. His finances were in good condition, and his treasury always well supplied with money.

Cosmo possessed at first the territories of the two republics of Florence and Pisa, the latter of which had been conquered by the Florentines before his time. In 1552 he added to his dominions, by an agreement with Jacopo d'Appiano, lord of Piombono, that principality, and also the island of Elba, when he fortified Porto Ferrajo, and improved its harbour. But a more important acquisition was that of Siena. That republic had survived the freedom of Florence, and had retained its independence under the protection of Charles V. But in 1552 civil factions having broken out among the citizens, who were excited also by the Florentine refugees, they drove away the Spanish garrison and admitted a French auxiliary force. In the following year Charles V. sent troops to reduce Siena, and Cosmo joined his forces to those of the emperor. Not succeeding that year, the emperor withdrew most of his troops; but at the beginning of 1554 Cosmo brought together a larger force, attacked Siena, and occupied its territory. At the battle of Marciano, in August of that year, the Siennese and their French allies were defeated. After a long and obstinate resistance, in which the women took part, Siena was compelled by famine to surrender to Cosmo in April 1555. The conditions were not harsh. Siena retained her municipal institutions under the protection of the emperor, who was to keep a garrison in it; but in the meantime Cosmo placed a garrison in it himself. All those citizens who chose to emigrate were at liberty to do so. A great many availed themselves of this stipulation, and retired to the town of Montalcino, where they kept up the semblance of a republic a little longer. Of 16,000 inhabitants which Siena had previous to the siege, only 6000 remained; the rest had either died or emigrated. In July 1557, Cosmo received of Philip II., who had succeeded Charles V., the formal possession of Siena and its territory, exclusive of the coast near Monte Argentario, with the ports of Orbitello, Telamone, Santo Stefano, and Port' Ercole, which remained as a dependency of Spain, and were afterwards annexed to the crown of Naples under the name of 'Stato dei Presidi'. The Siennese swore allegiance to Cosmo, who left to them their municipal laws and magistrates. In August 1559 the small republic of the Siennese republic at Montalcino surrendered to Cosmo. All Tuscany was now, for the first time since the fall of the Roman empire, united under one government.

Cosmo married Leonora, the daughter of Don Pedro de Toledo,

Spanish viceroy at Naples, and had five sons by her. Two of these, Giovanni, who had been made a Cardinal, and Garzia, died suddenly towards the end of 1562, and their mother soon after followed them to the grave. A report was spread and readily believed by the numerous enemies of Cosmo, that Giovanni had been killed by his brother, after which Cosmo, in his wrath, had killed Garzia with his own hand. Altieri has made this the subject of a tragedy. Probabilities however are against the truth of this assertion. (Botta, 'Storia d'Italia,' lib. xii.) Cosmo's eldest son, Don Francesco, married the archduchess Joanna, daughter of the Emperor Maximilian. In 1569 Pope Pius V., by a solemn bull dated 28th August, conferred upon Cosmo and his successors the title of grand-duke of Tuscany, as superior to all dukes and princes, and inferior in rank only to kings. In the following year Cosmo went to Rome to receive his grand ducal crown from the hands of the pope. In his bull the pope set forth the merits of Cosmo towards the Holy See for having entered zealously into the war against the Turks, and founded the military order of St. Stephen, in imitation of that of St. John of Jerusalem, for having given assistance to the king of France against the Huguenots, and having prosecuted the heretics in his own dominions: Cosmo had permitted the Inquisition to be established in Tuscany, and several persons had under its sentence suffered death for heresy or blasphemy.

Cosmo spent the latter years of his life chiefly at one or other of his villas, having entrusted the cares of administration to his son Francesco in 1561. Many things are said of the irregularity of his life in his old age, and his sons Francesco and Pietro were worse than their father in this particular. In 1570 he married Camilla Martelli, a private lady of Florence. Cosmo died 21st April 1574, in the Pitti palace, which had become the residence of the grand-dukes, and was succeeded by his son Francesco.

Cosmo, though an unprincipled man, was a very able statesman. In the general breaking up of most of the Italian independent states in the 16th century, he found means to create and consolidate a new and considerable principality, which has remained ever since independent, and he thus saved that fine country Tuscany from becoming a province of Spain, like Naples, Sicily, and Lombardy. He had the firmness to refuse Philip II.'s first offer of Siena as a fief of the Spanish crown, answering that he was an independent sovereign, and would not make himself the vassal of another. He refused the crown of Corsica, which was offered to him by the insurgents in 1564, because it would have embroiled him with other powers and endangered his own states. Cosmo encouraged the arts and literature. He founded the Florentine Academy, the Academy del Disegno, or of the fine arts; and he restored the University of Pisa. The Medici dynasty founded by Cosmo became extinct in 1737 by the death of the grand-duke Gian Gastone. He was succeeded in his sovereignty by Francis duke of Lorraine, the husband of Maria Theresa of Austria.

(Botta, *Storia d'Italia*; Galluzzi, *Storia del Gran Ducato di Toscana*; Ammirato, *Storia Fiorentina*, &c.)

COSTARD, GEORGE, born about 1710, M.A. of Wadham College, Oxford (of which he afterwards became fellow and tutor), in 1733, rector of Twickenham in 1764, at which place he died, January 10, 1782. He was respectable both as a classical and oriental scholar and as a mathematician; an account of his miscellaneous writings may be found in Kippis's 'Biographia Britannica.' He was the editor of the second edition of Hyde's work on the 'History of the Persians,' but his claim to notice is principally derived from his 'History of Astronomy,' &c., London, 1757. This work appears to have obtained more reputation abroad than at home, where it certainly is not appreciated. It is a history of the rise and progress of the fundamental doctrines of astronomy, mixed up with an elementary account of them, in order of discovery, and accessible to a student who can use a common globe, and has the first rudiments of geometry. In all matters of ancient and oriental learning Costard frequently cites the passage and always the reference, which gives his work a lasting value.

COSTER, LAWRENCE. [KOSTER.]

COSWAY, RICHARD, R.A., was born in 1740 at Tiverton, in Devonshire, where his family, originally Flemish, had been long settled, and his father was master of the public school. He was placed by his uncle, the mayor of Tiverton, with Hudson, and afterwards at Shipley's drawing-school in the Strand. At this time Cosway was very diligent, and he obtained between the fourteenth and twenty-fourth years of his age five premiums from the Society of Arts. His chief excellence was in miniature-painting, for which he had very great ability, and in which professionally he was successful to the utmost degree. He was patronised by all the rank and wealth of his time: the Prince of Wales, afterwards George IV., was among his friends and patrons. He made a large income; but he was sumptuous and hospitable in his habits, and his expenditure probably kept pace with his income.

Cosway was elected a member of the Royal Academy in 1771, and painted several fancy portraits for its exhibitions. He exhibited 'Rinaldo and Armida,' 'Cupid,' 'St. John,' 'Venus and Cupid,' 'Madonna and Child,' and 'Psyche,' all of which were portraits of some of his titled patrons, good likenesses, and successful works in their style.

About this time he was married to Maria Hadfield, though of English parentage, a native of Leghorn. She had been educated in a

convent, where she was taught music and drawing—arts which she eventually pursued with such success as to excite general admiration both in Italy and in England. After her marriage with Cosway she became a very distinguished exhibitor at the Royal Academy, and her musical parties, in which she was the chief performer, at her house, formerly Astley's, in Pall Mall, and afterwards at 20, Stratford-place, Oxford-street, were among the chief attractions of the age. The Prince of Wales and the leading members of the nobility were frequent visitors, and all the political, literary, artistic, and social 'lions' of London were there to see and be seen. The house in which these parties were held was furnished in the most costly and gorgeous style imaginable: almost every room was a museum of works of art and unique furniture of the most elaborate workmanship, adorned with natural and artificial curiosities from the four quarters of the globe. In his dress also Cosway was proportionably magnificent, a sort of modern Parrhasius; and all this magnificence and splendour were the fruit of his industry. His wife was equally industrious, and painted many portraits and other works of a poetic and imaginative nature; but Cosway would not allow her to paint portraits professionally. There are several prints after her works by Bartolozzi, V. Green, and others.

Cosway died in 1821, aged 80, and his widow retired to Lodi, established a ladies' college there, and became widely known and respected. She had spent some years at Lodi previously, during the war, for the benefit of her health, and had acquired a strong attachment for the place.

(Smith, *Nollekens and his Times*; Cunningham, *Lives of the most eminent British Painters, &c.*)

COTES, FRANCIS, R.A., one of the originators of the Royal Academy of Arts in London, was born in London in 1725, where his father was an apothecary. He was the pupil of George Knapp, and distinguished himself by his portraits in crayons, in which he was unrivalled. He was a good painter in oil, and was by many regarded as equal or superior to Reynolds: both painters had recourse to the same artist, Toms, for the painting of their draperies. Cotes was in great practice, and lived in the house in Cavendish-square which after his death was occupied by Romney, and subsequently by Sir M. A. Shea. Walpole mentions a few of his best works—as a full-length of the queen of George III. holding the princess-royal on her lap, engraved by W. W. Ryland; Mrs. Child, of Osterly Park; the beautiful daughter of Wilton the sculptor, afterwards the wife of Sir Robert Chambers; his own wife; O'Brien, the comedian; and Polly Jones, a woman of pleasure. Many of his portraits have been engraved by Bartolozzi, Green, McArdell, and others. He died in consequence of taking soap-les for the stone in 1770, before he had completed his forty-fifth year.

COTES, ROGER, born July 10, 1682, at Burlage, near Leicester, of which place his father was rector. His first education was received partly at Leicester school, partly from an uncle, who was the father of Dr. Robert Smith, the author of the 'Optics.' He was afterwards placed at St. Paul's School, and in April 1699 was admitted at Trinity College, Cambridge, of which foundation he was elected fellow in 1705. In January 1706 he was elected Plumian Professor, at the time of the establishment of that chair. In 1713 he took orders. He died June 5, 1716, aged 34, and was buried in the chapel of his college, where there is an epitaph upon him by Dr. Bentley. He was succeeded in the Plumian professorship by his cousin, Dr. R. Smith, the editor of his works. ('Biographia Britannica.')

The early death of Cotes being taken into account, few persons have left more reputation behind them than he did in matters of exact science. Newton is reported to have said, "If Cotes had lived, we should have known something." As it is, we have not much to say in a biographical article. The discoveries of Cotes have exercised a decided influence upon various parts of mathematics. For his reputation on the continent, it is unfortunate that he died so near the termination of the discussion relative to fluxions. The problems which he left were made the subject of a challenge to foreign mathematicians by Dr. Brook Taylor, in the interval which elapsed between his death and the publication of his works; and some bitterness of feeling was excited which was unfavourable to the proper estimation of their merits. (Montucla, 'Hist. des Math.', vol. iii, p. 154.) We shall now briefly describe them.

The first work which Cotes published was the second edition of Newton's 'Principia' (1713), to which he prefixed the well-known preface. This treats of gravitation in general, and of the objections which were made to it. He also published an account of a remarkable meteor in the 'Phil. Trans.' for 1715. His hydrostatical and pneumatic lectures were printed after his death, in 1738, by Dr. R. Smith.

The mathematical papers of Cotes were published after his death by Dr. Smith, under the title of 'Harmonia Mensurarum, sive analysis et synthesis per rationum et angularum mensuras promiscue accedunt alia opuscula mathematica,' Cambridge, 1722. The most definite description which can be given of it is, that it was the earliest work in which decided progress was made in the application of logarithms and of the properties of the circle, to the calculus of fluents. The first book contains an extended comparison of systems of logarithms, with applications of them to the finding of areas. The second is what we should now call a table of integrals, depending on logarithms and arcs of a circle. The third consists in applications of the second. Then

follows a mass of extensions, digested, mostly from Cotes's papers, by Dr. Smith. The *opuscula* consist in—1. A tract on the estimation of errors in mixed mathematics, consisting mostly of an investigation of the method of choosing spherical triangles, so that the errors of the data shall produce least effect upon the *quæsitæ*, but ending with what we must call the first glimpse of a method of choosing the proper mean for discordant observations. 2. A tract on the differential method of Newton. 3. On the construction of tables by differences. 4. On the descent of heavy bodies; on cycloidal motion, &c.

COTMAN, JOHN SELL, an artist whose masterly etchings of architectural subjects—old buildings and other antiquities—have obtained for him the honourable distinction of the English Piranesi, was born at Norwich, about the year 1780, and educated at the free school of that city, on quitting which he immediately took to his pencil as his future profession. He first practised chiefly in water-colour painting, in which he displayed a vigour and boldness very unusual at that period; but though he did not entirely abandon that branch of art, he afterwards applied himself more particularly to architectural drawing and engraving—and to etching upon copper views made for that purpose by himself. His first publication of the kind was his 'Miscellaneous Etchings of Architectural Antiquities in Yorkshire,' &c., in 28 plates, folio, 1812; immediately succeeded by the 'Architectural Antiquities of Norfolk,' fol., 1812-17; and he at the same time brought out the 'Sepulchral Brasses in Norfolk,' 84 plates, large 4to, 1813-16. In 1817 he went to France, where he spent some time in collecting the materials for his next, and the finest of all his works, the 'Architectural Antiquities of Normandy,' which appeared in two volumes folio, 1820, with 100 plates, and descriptive and historical letter-press by Mr. Dawson Turner of Yarmouth, who zealously patronised him during his residence in Norfolk. He afterwards settled entirely in London, and for a few years before his death, which took place in 1843, held the appointment of teacher of drawing in King's College, London.

COTTIN, SOPHIE RESTAUD, born in 1773, was brought up at Bordeaux by her mother, who was an accomplished and well-informed woman. At the age of seventeen she married Mr. Cottin, a wealthy Parisian banker, with whom she resided in the capital. Three years after, she lost her husband, which circumstance, added to the horrors of the revolution, induced her to retire to a cottage in the valley D'Orsay. To beguile her solitude she began to write a novel, 'Claire d'Albe,' which, notwithstanding the good intentions of the authoress, whose object was to point out the dangers of seduction, had the unfortunate effect of enlisting the sympathies in favour of the heroine, who is guilty of adultery—a tendency however common to many, and some of the best French novels. In Madam Cottin this was only an error of judgment and inexperience, for her heart was pure, and her sentiments and conduct strictly virtuous. It is said that the publication of 'Claire d'Albe' was owing to a desire to assist a person of her acquaintance, who, being proscribed during the revolution, stood in need of money to effect his escape; Madam Cottin hastily offered the sheets, which she had been writing for her amusement, to a bookseller, and gave the produce to the fugitive. She followed 'Claire d'Albe' by 'Malvina,' 'Amelie Mansfield,' and 'Mathilde,' a tale of the Crusades, which had great popularity. Her last and in many respects her best work was 'Elizabeth, or the Exiles in Siberia,' the characters and sentiments of which are most unexceptionable, the action well conducted, and the termination satisfactory. 'Elizabeth' is accordingly a work, which, for a long succession of years, was generally put into the hands of young persons studying French, and has been translated into most European languages. The style of 'Elizabeth' is considered more carefully correct and finished than that of her other novels. Madam Cottin, who was a Protestant, and had attentively studied the Scriptures, had begun a work intended to demonstrate the truth of the Christian religion by its sympathy with the best sentiments and affections of the heart. She had also begun a work on education. She did not live to finish either: she died in August 1807, at the age of thirty-four. Most of her works were published anonymously. They were collected and published at Paris, in 5 vols. 8vo, 1817.

COTTLE, JOSEPH, born in 1774, was a bookseller and publisher in Bristol, but retired from business in 1798. Mr. Cottle wrote a poem entitled 'Alfred,' one on 'The Fall of Cambria,' another on 'Malvera Hills,' and some other pieces in verse and prose. But he is more likely to be remembered by his connection with the poets Coleridge, Southey, and Wordsworth, of which he has given a very full account in his 'Recollections of Coleridge,' a work of some value in connection with the early part of the poet's career. The earliest poems of Coleridge and Southey were published by Mr. Cottle, who was a kind and generous friend to both of the young poets at their outset in life. Mr. Cottle was much respected in Bristol for his amiable personal qualities, and for his active connection with various benevolent projects. He had a brother, AMOS COTTLE, who also wrote verses, and translated the 'Edda.' The name of Amos Cottle seems to have afforded much mirth to the wits of the last generation: Byron has hitherto both the brothers into more than one stanza, while the Anti-jacobin has coupled their names in a like ludicrous manner. Amos Cottle is said to have been a superior scholar and an excellent man. He died in 1800. His verses have long been forgotten.

COTTON, CHARLES, was born in 1630, at Beresford Hall in Staffordshire, the seat of his father, which was afterwards his own property and the chief place of his residence. He was educated at Cambridge, and travelled on the Continent, after which he married and lived principally in the country. He died at Westminster in 1697. His name is best secured against forgetfulness by his friendship for Isaac Walton, and his co-operation in the later editions of the 'Complete Angler.' (WALTON, ISAAC.) But he was an active translator from the French, of Montaigne's 'Essays,' of historical and other prose works, and of Corneille's tragedy 'Horace;' and he published also various productions in verse, both serious and comic. His most ambitious poem of the former class is 'The Wonders of the Peak;' but none of his serious poems have kept their ground even in the favour of studious critics, while by all other readers they are completely neglected. He is perhaps more generally known as the author of 'Scarronides, or Virgil Travestie,' a burlesque imitation of three books of the *Æneid*—coarse in taste, and weak in wit, as well as low in its tone of moral feeling. His prose imitations of Lucian, and his 'Voyage to Ireland' in verse, are better specimens of his talents for humour. There are several incomplete collections of his works.

The translation of Montaigne has great merit. Cotton's genuine version was afterwards spoiled, or, as it is expressed in the preface to the edition of 1759, "it was polished or rather modernised in some pages of our last edition; but in the present one (1759), it is corrected and improved throughout, besides the rectifying of many mistakes, which Mr. Cotton probably would not have been guilty of, if he had been assisted by those dictionaries published since his time, that are the best explainers of the Gascon language, which was Montaigne's mother tongue." If this second translation has corrected mistakes, it has certainly not improved the style of Cotton's version, which had considerable merit of its own, as well as affinity to the manner of Montaigne.

COTTON, SIR ROBERT BRUCE, an eminent English antiquary, descended from an ancient family, was the son of Thomas Cotton, Esq., and born at Denton, in Huntingdonshire, January 22, 1570. He was educated at Trinity College, Cambridge, where he took the degree of B.A. in 1585. His taste for antiquarian studies induced him to repair to London, where he became a member of a society of learned men attached to similar pursuits. He soon distinguished himself as a diligent collector of records, charters, and instruments of all kinds relating to the history of his country. The dissolution of monasteries, half a century before, had thrown so many manuscripts of every description into private hands, that Mr. Cotton enjoyed peculiar advantages in forming his collection. In 1600 he accompanied Camden, the historian, to Carlisle, who acknowledges himself not a little obliged to him for the assistance he received from him in carrying on and completing his 'Britannia.' The same year Cotton wrote 'A Brief Abstract of the Question of Precedency between England and Spain.' This was occasioned by Queen Elizabeth desiring the thoughts of the Society of Antiquaries already mentioned upon that point, and is still extant in the Cottonian Library. ('Jul.' C. ix. fol. 120.) Upon the accession of King James I. he received the honour of knighthood, and during this reign was not only courted and esteemed by the great, but consulted as an oracle by the privy councillors and ministers of state upon very difficult points relating to the constitution. In 1608 he was appointed one of the commissioners to inquire into the state of the navy, which had been neglected after the death of Queen Elizabeth; and he drew up a memorial of their proceedings to be presented to the king, a copy of which is also preserved in the Cottonian Library. (MS. 'Jul.' F. iii.) In 1609 he wrote 'A Discourse of the Lawfulness of Combats to be performed in the Presence of the King, or the Constable and Marshall of England,' which was printed in 1661 and in 1672. He drew up also in the same year, 'An Answer to such Motives as were offered by certain Military Men to Prince Henry, to incite him to affect Arms more than Peace.' This was composed by order of that prince, and the original manuscript remains in the Cottonian Library. ('Cleop.' P. vi. fol. 1.) New projects being contrived to fill the royal treasury, which had been prodigally squandered, none pleased the king, it is said, so much as the creating a new order of knights, called baronets; and Sir Robert Cotton, who had been the principal suggester of this scheme, was in 1611 chosen to be one, being the thirty-sixth on the list. His principal residence was then at Great Conington, in Huntingdonshire, which he soon exchanged for Hailey St. George, in Cambridgeshire. He was afterwards employed by King James to vindicate the conduct of Mary, queen of Scots, from the supposed misrepresentations of Buchanan and Thuanus. What he drew up on this subject is thought to be interwoven in Camden's 'Annals of Queen Elizabeth,' or else printed at the end of Camden's 'Epistles.' In 1616 the king ordered him to examine whether the Papists, whose numbers then made the nation uneasy, ought by the laws of the land to be put to death, or to be imprisoned. This task he performed with great learning, and produced upon that occasion twenty-four arguments, which were published afterwards, in 1672, among 'Cotton's Posthuma.' It was probably then that he wrote a piece, still preserved in the Royal Library, entitled 'Considerations for the repressing of the Increase of Priests, Jesuits, and Recusants, without drawing of blood.' He was also employed by the House of Commons when the match

between Prince Charles and the Infanta of Spain was in agitation, to show, by a short examination of the treaties between England and the House of Austria, the unfaithfulness and insincerity of the latter, and to prove that in all their transactions they aimed at nothing but universal monarchy. Sir Robert Cotton wrote various other works, many of them small pieces in the shape of dissertations, too numerous to be mentioned here; some of them are among his 'Posthuma,' others are printed in Hearne's 'Discourses,' and a few more still remain in manuscript.

As early as 1615 Sir Robert Cotton's intimacy with Carr, earl of Somerset, laid him under suspicion with the court of having some knowledge of the circumstances of Sir Thomas Overbury's death. He was even committed to the custody of an alderman of London; nor although nothing could be proved against him, was he released from this confinement till the end of five months, during which time he appears to have been interdicted the use of his library. The perfidy of Gondomar, the Spanish ambassador, about the same time, drew upon him another imputation, his name having been, without foundation, inserted in a list suffered to go abroad of persons who had secretly received gratuities from the Spanish ambassador for sinister purposes. From this however his honour was perfectly vindicated.

Being a member of the first parliament of Charles I., Sir Robert Cotton joined in complaining of the grievance which the nation was said in 1628 to groan under; but he was always for mild remedies, and zealous for the honour and safety of the king. In the next year an occurrence took place, the consequences of which shortened his days. A tract was handed about in manuscript, entitled 'A Project how a Prince may make himself an absolute Tyrant.' The inquiries that were immediately made for the author of so pernicious a performance led at length to the Cottonian Library. Sir Robert, perfectly conscious of his innocence, made strict inquiry into the transaction, and soon found that a copy of this tract, written at Florence in 1613 by Robert Dudley, duke of Northumberland, under the less exceptionable title of 'Propositions for his Majesty's Service to bridle the Impertinency of Parliaments,' had, unknown to him, found its way into his library, and that, equally without his knowledge, his librarian or amanuensis, as was suspected, for a pecuniary consideration, had suffered one or more copies of it to be taken, under the former of these titles. Although Sir Robert Cotton completely vindicated his innocence of having written or disseminated this tract, so destructive to the liberties of the people, yet under the renewed pretence that his library was not of a nature to be exposed to public inspection, it was again put in sequestration, and himself once more excluded from all access to it. He died at his house in Westminster, May 6, 1631. A short time before his death he requested Sir Henry Spelman to signify to the Lord Privy Seal, and the rest of the lords of the council, that their so long detaining of his books from him, without rendering any reason for the same, had been the cause of his mortal malady. From this, as well as other circumstances, it appears that his library was never restored to his possession. He was buried on the south side of the church of Conington, where a suitable monument was erected to his memory.

By his will Sir Robert Cotton directed that his library should not be sold, but should pass entire to his heirs; and it was much augmented by his son, Sir Thomas Cotton, and his grandson, Sir John Cotton. In 1700 an act of parliament passed for the better securing and preserving this library in the name and family of the Cottons, for the benefit of the public; the mansion house, in which the library was contained, to be preserved for the use of the descendants of Sir Robert Cotton, the founder, for ever, and the library to be made publicly accessible; and to be vested after Sir John Cotton's death in trustees. Sir John Cotton died in 1702. Another act of parliament was then framed, which passed in 1706, by which the purchase of the house was effected for the sum of 4500*l.*, and that and the library vested thenceforth in the queen, her heirs, and successors for ever: the management of the library being still settled in trustees. Whether it was for the purpose of erecting a new building for the reception of the library on the site of the said house—which indeed was directed by the last-mentioned act—or for what other reason, does not at present appear; but we are informed in a subsequent report of a committee of the House of Commons, that the library was in the year 1712 removed to Essex House, in Essex-street, Strand, where it continued to the year 1730, when it was conveyed back to Westminster, and deposited in a house in Little Dean's Yard, purchased by the crown of the Earl of Ashburnham. Here, shortly after, on the 23rd of October 1731, a fire broke out, in which 111 manuscripts (many of them of the greatest interest) were lost, burnt, or entirely defaced, and 99 rendered imperfect. It had indeed nearly proved fatal to the whole library. What remained were removed, by permission of the dean and chapter, into a new building designed for the dormitory of Westminster school. In 1753, when the legislature was induced by the will of Sir Hans Sloane to found the British Museum, the Cottonian library was included in the act under which that institution was founded, and was transferred to the British Museum in 1757. The act directed that two trustees, to be nominated in succession by the representatives of the Cotton family, should be for ever added to those appointed by the same act for the general execution of its purposes.

Besides the library of manuscripts, the Cottonian collection con-

tained a considerable number of valuable coins, chiefly Saxon and old English, and several antiquities Roman and English, all of which are now incorporated in the collection of the British Museum.

A catalogue of this library, in a thin folio volume, compiled by Dr. Thomas Smith, was printed at Oxford in 1696; and a more ample one, accompanied by a copious index, compiled by the late Joseph Planta, Esq., was published under the orders and at the expense of the Commissioners upon the Public Records, folio, 1802.

Sir Robert Cotton was liberal in communicating materials out of his collections in his life-time. Speed's 'History of England' is said to owe most of its value and ornaments to it; and Camden acknowledges that he received the coins in the 'Britannia' from his collection. To Knolles, the author of the 'Turkish History,' he communicated authentic letters of the Knights of Rhodes, and the despatches of Edward Barton, ambassador from queen Elizabeth to the Porte. Sir Walter Raleigh, Lord Bacon, Selden, and Lord Herbert, were all indebted to Sir Robert Cotton's library for materials. Almost every recent work of importance connected with English history, is a proof that its treasures continue at this day unexhausted.

COULOMB, CHARLES AUGUSTIN DE, was born at Angoulême in 1736, studied at Paris, and entered at an early age into the army. After serving with distinction for three years in the West Indies, he returned to Paris, where he became known by a treatise on the equilibrium of vaults (1776). In 1779 he was employed at Rochefort, where he wrote his 'Théorie des Machines Simples,' a treatise on the effects of friction and resistances, which gained the prize of the academy, and was subsequently printed separately in 1809. A project of navigable canals had been offered to the États de Bretagne, and Coulomb was appointed by the minister of marine to examine the ground. His report was unfavourable, which so displeased some influential persons that he was placed in confinement: the pretext was, that he had no order from the minister of war.

The États afterwards saw their error, and offered Coulomb a large recompense, but he would accept nothing but a seconds' watch, which afterward served him in all his experiments. In 1784 he was intendant des eaux et fontaines; in 1786 he obtained the reversion of the place of conservateur des plans et reliefs, and was sent to England as a commissioner to obtain information on the hospitals. At the revolution he lost his public employments, and devoted himself to his domestic affairs. He was one of the first members of the Institute, and an inspector-general of public instruction. He died August 3, 1806, having supported a high moral and social character through life.

There are many men into whose biographies we are obliged to insert more account of their labours than will be necessary in the case of Coulomb. All his researches are of a permanent character, and belong to treatises of mechanics and electricity. We have no prominent acts of mind to record which individualise his discoveries, though they were marked by a union of patient industry and experimental sagacity of no common order, accompanied by a strong sense of the necessity of mathematical experiment, or numerical determination of mechanical phenomena. He was, we may say, the founder of the school of experimental physics in France, a country which, till his time, had been by no means pre-eminent in that branch of discovery. His researches on friction, and resistances in general, were the first in which the subject had been pursued manually by one with the knowledge of mathematics necessary to combine or separate the results according to the subject and the method. In electricity he was the first who invented the method of measuring the quantity of action, and from it he deduced the fact of electrical attractions and repulsions, following the Newtonian law. He ascertained the non-penetration of these agents into the interior of solid bodies, and on these two conclusions the mathematical theory of electricity is now based. He even deduced the second phenomenon from the first. He extended in a great degree to magnetism his conclusions on electricity. The instrument by which these brilliant results were obtained was of his own invention, the Torsion Balance, the principle of which is a needle hanging from a flexible thread, in which the force of torsion necessary to produce a given effect in producing oscillations of the needle being first ascertained, the instrument remains a determinate measurer of any small forces; or, if the absolute force of torsion be unknown, it may be made to give comparative determinations. This construction, in the hands of Cavendish, determined the mean density of the earth, and is now as much of primary use in delicate measurements of force, as the common balance in analytical chemistry. There is, perhaps, no one to whom either the determination of resistances in mechanics, or the theory of electricity, is so much indebted as to Coulomb. The account of his life is from the article in the 'Biog. Univ.' by M. Biot.

COURIER, PAUL LOUIS, was born in 1774. His father was a substantial farmer, who gave him a good education. Courier made considerable progress both in classical and mathematical studies. He served in the French army in the campaign of Rome in 1798-99. In his letters written from that country to several friends, and especially in one dated Rome, January 8, 1799, published long after in his 'Correspondance Inédite,' he gives a frightful account of the spoliation, plunder, and cruelties committed by the invaders in that unfortunate country. Courier's love of the arts and literature, which never forsook him during his military career, made him especially indignant at the rapacity with which precious sculptures, paintings,

and manuscripts were torn from public and private collections, and hastily and often ignorantly or carelessly huddled together and packed up for Paris, by which several valuable objects were injured or lost. He also describes the misery of the people of Rome, many of whom were absolutely starving, while the generals, commissioners, and other agents of the French Directory were revelling in luxury. On his return to France after the first peace, Courier published several translations from the Greek, such as 'Isocrates,' 'Eulogy of Helena,' Xenophon's treatise on the 'Command of Cavalry and on Equitation,' and remarks upon Schweighæuser's edition of 'Athenæus.' He also began a translation of Herodotus.

In 1806 he again served in Italy with the army that invaded the kingdom of Naples. He went into Calabria as far as Reggio, and witnessed the desultory but cruel warfare carried on in those regions. His letters from Naples, Calabria, and Puglia, 1806-7, give some valuable information concerning those times and events. Courier served with the rank of chef d'escadron in the Austrian campaign of 1809. After the battle of Wagram he gave in his resignation, which was readily accepted; for his inquisitive turn of mind and independent temper made him looked upon as a troublesome person by the more thoroughgoing officers of Napoleon. On reaching Florence, he discovered in the Laurentian library an unedited manuscript of Longus, of which he meant to avail himself for a translation of that author. Happening to upset an inkstand on the manuscript, by which accident a page was blotted, the librarian accused him of having done it purposely. Courier defended himself; but some persons in power at the court of the Princess Eliza, Napoleon's sister, took part against him, and he was ordered out of Tuscany. Courier wrote a humorous account of the whole transaction in a letter addressed to Mr. Raynouard, in which he did not spare his accusers. His translation of Longus was published in 1813, and was well received by the learned.

Retiring to his farm at Veretz, in the department of Indre-et-Loire, Courier heard with no regret the fall of Napoleon, and expressed himself satisfied with the charter given by Louis XVIII., if conscientiously fulfilled. He however began soon to find fresh matter for his satirical vein. His 'Livret,' or 'Memorandum-book,' and his letters, give a curious picture of provincial politics and of the state of society in the interior of France after the restoration. His letters, several of which were published at the time in the 'Censeur,' have been compared for their power and humour to Pascal's celebrated 'Provinciales.' When, in 1821, a subscription was opened all over France to purchase the estate of Chambord for the infant Duke of Bordeaux, he wrote 'Simple Discours aux Membres de la Commune de Veretz,' for which he was tried, and condemned to one month's imprisonment. He published an account of his trial, under the title of 'Procès de Paul Louis Courier, vigneron.' Courier was now looked upon as one of the most formidable antagonists of the Bourbonist party. He was however by temper caustic and satirical rather than factious. At the beginning of 1825 he was found murdered near his house at Veretz, but no clue was discovered to the perpetrators of the crime. Some attributed it to political, others, perhaps with more reason, to private enmity. His works were collected and published in 4 vols. 8vo, Brussels, 1828. The fourth volume contains his unedited letters. They are valuable as sketches of actual life and manners, and as materials for contemporary history.

COURTOIS, JACQUES. [BOGOGNONE.]

COUSIN, JEAN, a celebrated French painter, sculptor, and geometrician, contemporary with Il Rosso and Primaticcio in the 16th century. The date neither of his birth nor death is known; but he was born at Soucy near Sens, was the first Frenchman who attained distinction in historical painting, and was the principal favourite at the French court in the reigns of Henri II., François II., Charles IX., and Henri III. He is sometimes in vague language termed the founder of the French school, which however means nothing more than that he was the first distinguished French historical painter. He married the daughter of a French general officer, Lieut.-Gen. Rousseau, of Sens, and he was established chiefly as a painter on glass at Sens, but he generally spent a portion of the year at Paris. His most celebrated picture is the 'Last Judgment,' painted for the Minims of Vincennes, and now in the Louvre. Though not a work of high order, it is carefully executed, and in parts well drawn though harsh, well foreshortened, and well though highly coloured. It was engraved by Peter de Jode the elder, in twelve sheets; the whole print is four French feet high, by three feet four inches wide, and one of the largest prints in existence.

Many of the old painted windows of the churches of Sens and Paris, and elsewhere, were from the designs of Cousin. There are still some remains of his paintings on glass in the church of St.-Gervais, which were his principal works of this class at Paris. He was also a writer of ability; he wrote on geometry and perspective, and a small work on the proportions of the human body, with illustrative woodcuts, which went through many editions; the first work was published in 1560, and an edition of the second was printed in 1625 in 4to, under the following title:—*Libre de Pourtraiture de Maistre Jean Cousin, Peintre et Geometrien très excellent*, &c. In sculpture his principal work is the monument of Admiral Chabot, in the church of the Celestines. Cousin was still living in 1589, but much advanced in years. (Félibien, *Entretiens sur les Vies, &c., des Peintres*.)

* COUSIN, VICTOR, was born in Paris, November 28, 1792. He received his education at the Lycée Charlemagne. Scarcely had he entered his sixteenth year when the grand prize of honour was allotted to him at the annual distribution. The minister Montalivet, who was present, was so struck by his ability as to propose to young Cousin to dedicate himself to public business; but he declined the alluring offer. Soon after he was admitted into the École Normale, which had recently been founded; here he was appointed répétiteur, or private teacher, of Greek literature, and afterwards he obtained a professorship of philosophy.

In 1811, he attended the lectures of the celebrated Laromiguière, whose theory was a mixture of Condillac and Descartes, of sensation and spiritualism, and who made it his mission to reconcile the two systems. Cousin was at first fascinated by this theory, and still more by the elegant phraseology and lucid exposition of the lecturer. From him therefore he may be said to have acquired the art of giving to the most abstruse principles that transparent and palpable form which universally appears in his style. It was very probably at the same period, that his great idea first presented itself to his mind, "that each system is true, but incomplete; and that by collecting all the systems together a complete philosophy would be obtained."

In 1813 and 1814 he attended the courses of philosophical lectures, delivered at the Faculté des Lettres, by Royer-Collard, whose serious and earnest mind had long distrusted that school of sensation, which Locke and Condillac had established in the 18th century, and who had sought refuge from these doubts in the new doctrines of Reid and Hutcheson and the other founders of the Scotch system. This new doctrine, which insisted that there were notions in the mind totally independent of the senses, was instantly and ardently embraced by Cousin, and so clearly and fully did he conceive this theory that when Louis XVIII. appointed the lecturer president of the Commission of Public Education, Royer-Collard obtained permission to transfer his chair of philosophy to his young friend, who was his junior by thirty years. Cousin thus became lecturer at the Faculté des Lettres, and began his famous course of the History of Philosophy, December 7, 1815, being at that time in his twenty-fourth year. He entered upon his public career with a mind richly stored for his task. His youth heightened the impression he made upon his hearers, and he at once became popular. Damiron and Jouffroy, who had been his fellow students under Royer-Collard, and next to himself in their master's esteem, now took him for their teacher, and afterwards continued his disciples. Having learned to doubt from Royer-Collard, he resolved to examine in turn all the great philosophers, both ancient and modern, before he formed his opinions. He became a universal inquirer. He entered singly and without prejudice upon each philosopher, and in each he believed he had found a system, and in each system a fragment of truth. As fast as he proceeded in this inquiry he communicated what he had found to the public, sometimes in lectures, at other times in books. To enable his pupils to judge for themselves, he published the works of Plato, the inedited works of Proclus, and an edition of Descartes, though the whole did not appear till after his dismission. His translation of Plato in 13 vols. is considered excellent, and would preserve his name had he done nothing else. He also contributed many admirable papers to the 'Journal des Savants,' and the 'Archives Philosophiques.'

But in the midst of his intellectual labours he suddenly met with a severe discouragement; for having in one of his lectures defined man to be a freely acting force, the Bourbon government became alarmed, and dismissed him from the Faculté des Lettres in 1821.

In 1824 Cousin went to Germany in the capacity of tutor to the young Duke of Montebello. During his progress the frank opinions he expressed excited the suspicion of the Prussian authorities, who caused him to be arrested and conveyed to Berlin, where he was thrown into prison as an agitator. He remained in close confinement for six months, but the urgent remonstrances of M. de Damas, then French minister of Foreign Affairs, induced the Prussian ministers to reconsider the case, and subsequently to grant him his passports to return to his native country. After his return he published, in 1826, his celebrated 'Fragments Philosophiques,' with a remarkable preface, which is still considered the best summary of his particular doctrine. For no man can be more entitled to the character of an original thinker notwithstanding all he has done to revive and give circulation to the systems of so many of his great predecessors.

The government of Charles X. restored the distinguished professor to his chair; and in April 1828 he delivered his famous course of lectures on Philosophy, at the Faculté des Lettres, to a numerous and enthusiastic audience. His former lectures had consisted principally of the history of ideal truth, as it had been explained by the great thinkers who had preceded him. But this time his own theory was exhibited. The first series was published in 1828 under the title of 'Cours d'Histoire de la Philosophie,' the second in 1829 as 'Cours de Philosophie.' Soon after, the accession of Louis Philippe introduced his friends Guizot and De Broglie to power. He now became a councillor of state, a member of the Board of Public Education, an officer of the Legion of Honour, and a peer of France, in quick succession. In 1831 he was commissioned by the ministry to proceed to Germany to examine the state of education in that country. The results were given to the world in 1832, 'Rapport sur l'état de l'Instruction Pub-

lique dans quelques pays de l'Allemagne:' this was translated by Mrs. Austin, and published in London in 1831. He succeeded Fourier in the Academy, and delivered his 'dîners,' or reception address, May 5, 1831. He seldom spoke in the Chamber of Peers, and when he did it was almost invariably on the subject of National Instruction. He published a large number of works during the reign of Louis Philippe: amongst others, the 'Inedited Works of Abelard,' 1836; 'Aristotle's Metaphysics,' 1838; several series of 'Fragments Philosophiques,' 1838-40; the 'History of Moral Philosophy in the 18th Century,' 2 vols. 8vo, 1829; 'Cours de Philosophie Morale,' 5 vols., 1840-41. His admirable biography of 'Jacqueline Pascal,' the sister of the great author of 'Les Pensées,' appeared in 1844. The narrative is a compilation; but the observations on the importance of female education, in the introduction, belong to the highest class of moral argument. Sufficient notice has not yet been taken of the plan and objects of Cousin in writing 'Jacqueline Pascal,' 'La Jeunesse de Madame de Longueville,' 1853, and his other biographies of women. A collected edition of his principal works, in 22 vols. 18mo, was published in 1846-47.

Since the fall of Louis Philippe, in 1848, this eminent man has lived in retirement.

COUSTOU, the name of two very distinguished French sculptors, brothers, of Lyon.

NICOLAS COUSTOU was born in 1658, and having received some instruction from his father, who was a carver in wood, went in his nineteenth year to Paris, and became the pupil of his uncle, Antoine Coysevox, a distinguished sculptor. When only twenty-three years of age he obtained the grand Academy prize in sculpture, and went in consequence as a pensioner to Rome. In Rome, where he remained three years, Coustou paid more attention to the modern than the ancient works in sculpture. His favourite masters were Michel Angelo and Algardi, whom he studied for their opposite qualities, endeavouring to combine in his own works the merits of each; to modify the harsh vigour of Michel Angelo by the less evident grace of Algardi.

His first great work in Paris was the colossal group representing the junction of the Seine and Marne, now in the garden of the Tuileries. There are four other statues by Coustou in the same garden, of which the best is the 'Berger Chasseur.' He made also the celebrated group of the 'Tritons' for the rustic cascade at Versailles. But his work of highest pretensions is the 'Descent from the Cross' in the choir of the cathedral of Notre Dame, generally called 'Le Vœu de Louis XIII.;' the figures of Louis XIII. and Louis XIV., which were on each side of it until 1831, when they were destroyed, were by Guillaume Coustou and Coysevox respectively. He executed many other distinguished works at Lyon and at Paris, for which he was well rewarded by Louis XIV., and a small pension was settled upon him by the city of Lyon. He enjoyed two pensions from the crown, amounting together to 6000 francs. He died in 1733, having been forty years a member of the French Academy.

GUILLAUME COUSTOU was born in 1678, and was also the pupil of his uncle Coysevox. He went likewise to Rome as a pensioner of the French government; but the pension was irregularly paid, and for a maintenance he assisted Le Gros on his bas-relief of St. Louis of Gonzaga. After his return to Paris, Guillaume Coustou executed many excellent works, several of which were for the gardens of Marly, but are now at the Tuileries; others are at Versailles: the two celebrated groups checking restive horses, somewhat in the actions of the ancient groups of Monte Cavallo, now at the entrance of the Champs Elysées, were at Marly until 1794. Still more celebrated works are the statues of the façade of the Château d'Eau opposite the Palais Royal; and the more extensive bas-reliefs of the principal entrance of the Hôtel des Invalides. He executed also the colossal bronze figure of the river Rhone for the monument of Louis XIV. at Lyon; the corresponding figure of the Saône was by Nicholas Coustou, and they are now both preserved in the town-hall of Lyon; the statue of Louis XIV. was destroyed during the revolution. He died in 1746, director of the Royal Academy of Painting and Sculpture. The French are not agreed as to the relative merits of these two sculptors, some preferring Nicolas, and others Guillaume: the style of Guillaume varied less than that of Nicolas from the ancient standard of proportions, but they were both more French in their tastes than Greek.

GUILLAUME COUSTOU the Younger, likewise a distinguished artist, was the son of the elder Guillaume. He was born at Paris in 1716, obtained also the grand prize of the Academy in sculpture, studied five years in Rome, and died treasurer of the Academy in 1771. He designed the sculptures of the front of the church of St. Geneviève, which were removed when that building was converted into the Pantheon: they were executed by a sculptor of the name of Dupré.

(De Fontenay, *Dictionnaire des Artistes*, &c.; D'Argenville, *Vies des fameux Architectes et Sculpteurs*, &c.)

COUTO, DIEGO DE. [BARROS.]

COVERDALE, MILES, Bishop of Exeter, a native of Yorkshire, was born in 1487. He was educated in the house of the Augustin friars in Cambridge, of which Dr. Barnes, afterwards one of the Protestant martyrs, was then prior. Whether he took a degree at the University of Cambridge in early life seems uncertain; but Goodwin says he afterwards received the degree of D.D. from the University of Tübingen, and was, though later in life, admitted 'ad eundem'

at Cambridge. Being in his early years attached to the religion in which he was brought up, he became an Augustin monk. In 1514 he entered into holy orders, and was ordained at Norwich; but he afterwards changed his religious opinions. Bale says he was one of the first who, together with Dr. Robert Barnes, his 'quondam' prior, taught the purity of the gospel, and dedicated himself wholly to the service of the Reformation. About this time, probably 1530 or 1531, the reformed religion began to show itself at Cambridge, where various eminent men, and Miles Coverdale amongst them, began to assemble for conference on those points which had been discussed by the reformers abroad. In 1532 he appears to have been abroad, and assisted Tyndale in his translation of the Bible; and in 1535 his own translation of the Bible appeared, with a dedication to King Henry VIII. It formed a folio volume, printed, as Humphrey Wanley thought, from the appearance of the types, at Zürich, by Christopher Froben. He thus had the honour of editing the first English Bible allowed by royal authority, and the first translation of the whole Bible printed in our language. The Psalms in it are those now used in the Book of Common Prayer. About the end of the year 1538 Coverdale went abroad again on the business of a new edition of the Bible. Grafton, the English printer, had permission from Francis I., at the request of King Henry VIII. himself, to print a Bible at Paris, on account of the superior skill of the workmen, and the goodness and cheapness of the paper. But, notwithstanding the royal licence, the Inquisition interposed by an instrument dated December 17, 1538. The French printers, their English employers, and Coverdale, who was the corrector of the press, were summoned before the inquisitors, and the impression, consisting of 2500 copies, was seized and condemned to the flames. The avarice of the officer who superintended the burning of the copies however, induced him to sell several chests of them to a haberdasher, for the purpose of wrapping his wares, by which means a few copies were preserved. The English proprietors, who had fled at the alarm, returned to Paris when it subsided; and not only recovered some of the copies which had escaped the fire, but brought with them to London the presses, types, and printers. This importation enabled Grafton and Whitchurch to print, in 1539, what is called Cranmer's, or 'The Great Bible,' in which Coverdale compared the translation with the Hebrew, corrected it in many places, and was the chief overseer of the work. Coverdale was almoner, some time afterward, to Queen Catherine Parr, the last wife of Henry VIII., at whose funeral he officiated in the chapel of Sudeley Castle, in Gloucestershire, in 1548. On August 14, 1551, he succeeded Dr. John Harman, otherwise Voysey, in the see of Exeter. On his appointment to this bishopric, Coverdale was so poor as to be unable to pay the first-fruits, which therefore the king, at the solicitation of Archbishop Cranmer, excused. On the accession of Queen Mary, and the consequent re-establishment of Catholicism, he was ejected from his see, and thrown into prison, out of which he was released after two years' imprisonment, at the earnest request of the King of Denmark, whose chaplain, Dr. John Machabeus, had married the sister of Coverdale's wife. On his release, which was on the condition of banishing himself, Coverdale repaired to the court of Denmark; he went afterwards to Wees, thence to Bergzabern, and finally to Geneva, where he joined several other English exiles in producing that version of the English Bible which is usually called 'The Geneva Translation;' part of which, the New Testament, was printed at Geneva in 1557, by Conrad Badius, and again in 1560, in which last year the whole Bible was printed in the same place by Rowland Harte. On the accession of Queen Elizabeth, Coverdale returned from exile; but having imbibed the principles of the Geneva reformers, as far as respected the ecclesiastical habits and ceremonies, he was not allowed to resume his bishopric, nor was any preferment offered to him for a considerable time. In 1563 Bishop Grindal recommended him to the bishopric of Llandaff; but it is supposed that Coverdale's age and infirmities, and the remains of the plague, from which he had just recovered, made him decline so great a charge. In lieu of it, however, the bishop collated him to the rectory of St. Magnus London Bridge. He resigned this living in 1566. The date of his death has been variously stated. The parish register of St. Bartholomew, behind the Royal Exchange, however, proves that he was buried February 19, 1568, in the chancel of which church a Latin epitaph for him remained till it was destroyed along with the church in the great fire of 1666. Coverdale was the author of several tracts calculated to promote the doctrines of the Reformation, and of several translations from the writings of the foreign reformers.

The third centenary of the publication of Coverdale's Bible was celebrated by the clergy throughout the churches of England, October 4, 1835; and several medals were struck upon the occasion.

COWLEY, ABRAHAM, the son of a grocer resident in Fleet-street, London, was born in 1618, and educated at Westminster School, and Trinity College, Cambridge. He was an early poet, and attributes the direction of his genius to the perusal of Spenser, whose works, he says, "were wont to lye in his mother's parlour;" and with which he made himself familiar before he was twelve years old. At the age of fifteen (not thirteen) he published a volume called 'Poetic Blossoms,' containing, among other things, 'The Tragical History of Pyramus and Thisbe,' written when he was ten years old. At college he increased his reputation by the elegance of his exercises; and, not to mention

minor works, composed the greater part of his 'Davideis,' an unfinished epic, in four books, on the troubles of David. Being attached to the court party, he was ejected in 1643, after he had taken his degree of M.A.; and he then settled in St. John's College, Oxford, where he became known and esteemed by some leading men; and being appointed secretary to Lord Jermyn, afterwards Earl of St. Alban's, was employed in the honourable and confidential office of cyphering and deciphering the correspondence of the king and queen. He followed the queen to Paris in 1646, and remained abroad ten years. Returning in 1656, as a sort of spy, "to take occasion of giving notice of the posture of affairs in this nation," he was seized, and obliged to give heavy security for his future behaviour. In the same year he published an edition of his poems, with a preface, in which he inserted some things suppressed in subsequent editions, which were interpreted to denote some relaxation of his loyalty. He also obtained, Wood says, through the influence of the men then in power, the degree of M.D. at Oxford in 1657—having professed the study of physic in order, it is said, to cloak the real motive of his visit to England. He does not appear ever to have practised, and the only fruit of his studies was a Latin poem upon plants in six books. Upon Cromwell's death he returned to France, and resumed his office. At the Restoration he expected to obtain the mastership of the Savoy, which had been promised to him both by Charles I. and Charles II. In this, to his great mortification, he was disappointed; but some amends were made him by a beneficial lease of the queen's lands at Chertsey in Surrey, whither he retired in 1665, and died in July 1667 in his forty-ninth year. He was buried near Chaucer and Spenser in Westminster Abbey, where in 1675 the Duke of Buckingham erected a monument to his memory.

Cowley is characterised by Dr. Johnson as "the last and undoubtedly the best" of the metaphysical authors, a curious class, of whom the biographer, in his life of Cowley, has given a critical account:—"In his own time he was considered of unrivalled excellence. Clarendon represents him as having taken a flight beyond all that went before him; and Milton is said to have declared that the three greatest English poets were Spenser, Shakspeare, and Cowley." For a long time he was an object of supreme admiration, and his Pindaric Odes were imitated to weariness by those who could emulate his extravagance, but not his learning, wit, and fertility. This fashion has long been at an end; and while the simpler of our older poets have of late years been increasing in popularity, Cowley, we conceive, is scarcely known to a majority even of the poetical readers of this country. His merits are summed up by Johnson in the following passage, which, making allowance for its Johnsonianism of thought and expression, very fairly characterises the poetry of Cowley:—"He brought to his poetic labours a mind replete with learning, and his pages are embellished with all the ornaments which books could supply: he was the first who imparted to English numbers the enthusiasm of the greater ode and the gaiety of the less; he was qualified for sprightly sallies and for lofty flights; he was among those who freed translation from servility, and instead of following his author at a distance, walked by his side; and if he left versification yet improvable, he left likewise from time to time such specimens of excellence as enabled succeeding poets to improve it." His faults are—negligent and sometimes vulgar diction, rugged and prosaic versification, pedantry, hyperbolical exaggeration, and an abundance, unchecked by judgment, of that particular sort of wit which Johnson defines to be the discovery of occult resemblances in things apparently unlike. His poetry proceeds from the head more than the heart, and dazzles oftener than it touches. The poetry of Cowley, in a word, is forced, affected, and unnatural, yet it is not undeserving of the careful examination of the student. His prose, on the other hand, is simple, manly, and rhythmical; easy without vulgarity, and strong without coarseness.

COWLEY, MRS. HANNAH, whose maiden name was Parkhouse, was born at Tiverton, in Devonshire, in 1743. She was married about 1772 to Mr. Cowley, a captain in the East India Company's army, by whom she had three children. Her husband was a man of taste, whom she consulted in the composition of her works; and the first of her plays, 'The Runaway,' was commenced half in jest, on her husband rallying her for expressing in the theatre a belief that she could write a drama. Her life was spent in retirement, mixing but little in the world, and, notwithstanding her dramatic turn, visiting even the theatre very seldom. She died at Tiverton on the 11th of March 1809, having survived her husband about ten years. 'The Works of Mrs. Cowley, Dramas and Poems,' were published in a collected edition, 1809-13, 3 vols. 8vo. Among them are three narrative poems of considerable length, but indifferent merit, 'The Maid of Aragon,' 'The Scottish Village,' and the 'Siege of Acre.' The artificial character of her poetical taste is indicated by the fact that she was the 'Anna Matilda' who corresponded with Mr. Morry under his newspaper signature of 'Della Crusca.' Her two tragedies likewise are worthless. Of her nine comedies several are much better. One of them, 'The Belle's Stratagem,' which first appeared in 1780, still maintains its place as a lively and excellent acting play; and 'A Bold Stroke for a Husband,' a play somewhat similar, has been repeatedly revived both in its original shape and with alterations.

* COWLEY, HENRY RICHARD WELLESLEY, second LORD, eldest son of the first Lord (better known as Sir Henry Wellesley), many years British ambassador at Paris and other courts, was born in

1804, and entered the diplomatic service at an early age. In 1824 he became an attaché at Vienna, and was consecutively secretary of legation at Stuttgart and secretary of the embassy at Constantinople. In 1848 he was sent as minister-plenipotentiary to Switzerland, and afterwards to Frankfurt; and in 1851, during the anxious crisis of the re-settlement of Germany into tranquillity, he acted as minister to the Germanic Confederation. In 1852 he succeeded the Marquis of Normanby as ambassador to the court of the Tuilleries. His name will hereafter be best remembered by having represented England, in conjunction with Lord Clarendon, at the Congress of Paris in March 1856, previous to the proclamation of peace.

COWPER, EDWARD, was born in 1790. Little or nothing has yet been published concerning the circumstances and events of the early life of this distinguished inventor and improver of machinery. It is known however that it was chiefly owing to some of his inventions in cylinder-printing that Mr. Applegath was induced to build the extensive printing-office in Duke-street, adjoining to Stamford-street, London, now occupied by Messrs. Clowes, and he was a partner with Mr. Applegath in that establishment. They were also connected in making machines for calico-printing, and in the construction of new machinery for printing the 'Times,' of which, in conjunction with Mr. Applegath, he published a description. In fact, some of the most important improvements in machine-printing were of his invention, such especially as the giving a diagonal action to the rollers on the self-acting inking-tables. In the Great Exhibition of 1851 he exhibited a model made by T. B. Winter, a student in King's College, London, of the printing-machine now in general use; and by such machines the catalogues of the Great Exhibition were printed. He had for many years an engagement at the large blacking-factory of Messrs. Day and Martin, in printing their labels in such a manner as to defy imitation. He also furnished some contributions to the 'Penny Cyclopædia.'

Mr. Cowper, during some of the later years of his life, was professor of mechanics and manufacturing arts at King's College, and it is as a lecturer that he was best known to the public. His process of imparting knowledge consisted not only in giving descriptions and illustrating them by models, but in exhibiting the machines themselves, and showing them at work. His manner of lecturing was simple and popular, and he had always a full attendance. His knowledge of machinery, of mechanical construction, and the mechanic arts, embraced the most minute as well as the largest objects. He wrote an elaborate article on a 'Button;' and he delivered lectures on the mechanical structure of the Crystal Palace of 1851. He was much respected for his urbanity, and for his readiness in making communications from his large stores of information to the humblest individuals as well as to persons of higher station. He died at his residence, Kensington, London, October 17, 1852.

COWPER, WILLIAM, was born on the 15th of November (old style) 1731, at Great Berkhamstead in Hertfordshire, of which place his father, the Rev. John Cowper, was rector. He was first placed, when he was but six years old, at a school kept by Dr. Pitman, at Market-street, in Hertfordshire. The cruelty of an elder boy rendered the two years which he spent here two years of misery. He was next placed in the house of an oculist, apprehensions being then entertained that he would lose his sight; and under the care of this oculist two more years of his boyhood were passed. At the age of ten he was sent to Westminster School, where he stayed till he was eighteen; applying during these eight years with diligence to his studies, and entering with spirit into boyish sports.

After leaving Westminster, Cowper was articled for three years to a solicitor, in whose office he had for a fellow-clerk the future Lord Thurlow. During these three years however he gained no great stock of legal knowledge, and when they were expired he took up his abode in chambers in the Middle Temple. In 1754 he was called to the bar, and in 1759 he was appointed a commissioner of bankrupts. One reason, and doubtless a principal reason, why the law had been fixed upon as Cowper's profession, was the existence of a certain amount of legal patronage in the hands of some of his relations. Having a small patrimony, and looking forward to the exercise in his favour of this influence, he cared not for those objects to which application would lead, any more than he liked the subject to which he was to apply; and accordingly he neglected the study of law. While residing in the Temple he made love to his cousin, Theodora Cowper, the sister of his correspondent, Lady Hesketh, and dabbled with literature. He was a member of a club called the 'Nonsense Club,' consisting entirely of Westminster men, among whom were Bonnell Thornton, Colman, and Lloyd; and he contributed a few papers to the 'Connoisseur,' of which Thornton and Colman were the joint projectors and writers.

His residence in the Temple extended through eleven years. In 1764, the last year of that residence, the offices of clerk of the journals, reading clerk, and clerk of the committees in the House of Lords, all which offices were at the disposal of a cousin of Cowper's, became vacant about the same time. The two last were conferred on Cowper. His patrimony was by this time well nigh spent, and the gift was therefore so far acceptable. But the duties attached to the offices of reading clerk and clerk of the committees were duties which required that he should frequently appear before the House of Lords; and to him, who suffered from extreme nervousness, a public exhibition of

any kind was, as he himself expresses it, "mortal poison." He therefore, almost immediately after having accepted them, resigned these offices, and took that of clerk of the journals. But here again, his cousin's right of nomination having been questioned, Cowper was unexpectedly required to submit himself to an examination at the bar of the house before being allowed to take the office. Thus the evil from which he seemed to have escaped again met him. "A thunderbolt," he writes in his memoir of himself, "would have been as welcome to me as this intelligence. . . . To require my attendance at the bar of the house, that I might there publicly entitle myself to the office, was in effect to exclude me from it. In the meantime the interest of my friend, the honour of his choice, my own reputation, and circumstances, all urged me forward—all pressed me to undertake that which I saw to be impracticable." Unceasing was the anguish which he now suffered. He even looked forward anxiously to the coming of insanity, a constitutional tendency to which had manifested itself some years before, that he might have a reason for throwing up the office; and when the dreaded day drew near, and he found himself still in possession of his senses, he determined on the commission of suicide. His many attempts to destroy himself all failed of success, owing, as he is pleased to explain it in his memoir, to direct interpositions of Providence. The office was ultimately resigned on the very day appointed for the examination, and shortly afterwards he became insane. He was immediately placed under the care of Dr. Cotton at St. Alban's, with whom he stayed until his recovery, which took place about eighteen months after, in June 1765.

The form which Cowper's insanity assumed was that of religious delusion. A belief that he had been irrevocably cut off from a state of grace in this world, and of salvation in the next, was that which preyed upon his mind previous to the coming of the shock, and was predominant while it lasted. In the three subsequent periods of his life during which madness returned to him, from 1773 to 1776, for about six months in 1787, and during the six years preceding his death, its form was the same.

On Cowper's recovery in 1765, he took up his residence in Huntingdon, solely that he might be within reach of a younger brother who was then at Cambridge. Here he became acquainted with the family of the Rev. Mr. Unwin, the beneficial influence exercised by whom on Cowper's subsequent life is well known. Finding that his spirits were sinking in the solitude in which he lived, and also that his scanty means were not sufficient to maintain a separate establishment, he became a boarder in Mr. Unwin's house. On Mr. Unwin's death in 1767, Cowper and Mrs. Unwin removed to Olney in Buckinghamshire, attracted thither by their esteem for Mr. Newton, who was then curate of the place. Mr. Newton, a man greatly to be respected for his unquestioned piety and moral worth, held strong views on the subject of religious duties; and having early acquired a powerful influence over Cowper, led him to engage his thoughts continually on religious subjects. Mr. Newton was a prominent member of that section of clergymen known as 'evangelical,' and his zeal had been powerfully stimulated by the religious movement which, originating with Wesley and Whitefield, had deeply penetrated the evangelical body in the Church. It is probable that Cowper, with his constitutional nervousness and predisposition to mental derangement, did not derive unmixed good from the excitement of frequent prayer-meetings and an unremitting attention to religious subjects. Mr. Newton had formed a plan of publishing a volume of hymns, and prevailed on Cowper to assist in composing them. They were afterwards published in 1776, under the title of 'Olney Hymns;' but Cowper, before he had proceeded far in their composition, was visited with his second attack of madness, which lasted nearly four years.

In 1776, after Cowper's recovery, Mr. Newton removed from Olney. By Mrs. Unwin's advice Cowper was now induced to commence a poem, taking, upon her suggestion, the Progress of Error for his subject; and he immediately went on to write three more moral satires, entitled 'Truth,' 'Table Talk,' and 'Expostulation.' These, together with the poems entitled 'Error,' 'Hope,' 'Charity,' 'Conversation,' and 'Retirement,' and some smaller pieces, were formed into a volume, which was published in 1782. He published a second volume in 1785, containing the 'Task' and 'Tirocinium,' the former of which poems had been commenced on the suggestion of another female friend, Lady Austen. It is to the same lady that we are indebted for the 'History of John Gilpin.' He had begun in 1784, so soon as the 'Task' and 'Tirocinium' had been written, his translation of Homer, which occupied him for the next six years. The translation was published in 1791. During its progress he had changed his place of residence from Olney to the neighbouring village of Weston, on the recommendation of his cousin, Lady Hesketh, with whom he had recently renewed a correspondence which had been long suspended, and whose attentions contributed much to the comfort of his later years. Almost immediately after the translation of Homer was completed he undertook to superintend a new edition of Milton's Works, and to furnish translations of the Latin and Italian poems. In 1792 he paid a visit to Hayley at Earsham, in Sussex, not having made a journey for twenty years before. Symptoms of his constitutional malady had occasionally shown themselves during the eight or ten preceding years; and in the beginning of 1794 he was again afflicted with madness. A change of scene being judged desirable, he was

removed first to North Tuddenham in Norfolk, thence to Mundley, and afterwards to East Dereham; and he succeeded in obtaining short intervals of comparative tranquillity, during which he composed one or two small pieces and revised his translation of Homer. Mrs. Unwin, his faithful companion, died on the 17th of December 1796; and after three dreary years, Cowper followed her to the grave on the 25th of April 1800. He died in his sixty-ninth year.

Cowper's merits have been summed up by Mr. Southey in the words—"the most popular poet of his generation, and the best of English letter-writers." His letters are written in a genuine unaffected English style, and are marked for the most part by a playfulness and humour which effectually prevent the weary feeling that usually attends a long continuous reading of epistolary correspondence. Absence of affectation is again a chief characteristic of his poems. They are free from all sickly sentimentality or mannerism in language. As regards freedom from the first, the manliness of the poet presents a striking contrast to the feminine character of the man; while, with reference to the second point, Cowper has the merit of having done much towards that improvement in poetic diction which subsequently received so great an impulse through the poems of Wordsworth. He was an enthusiastic lover of nature; and some of his descriptions of natural objects are such as Wordsworth himself might be proud to own. His poems contain also, as it is not too strongly expressed by Hazlitt, "a number of pictures of domestic comfort and social refinement which can hardly be forgotten but with the language itself." ('Lectures on the English Poets,' p. 182.) There is a striking amount of variety in his poems, or, taking but one of them, in the 'Task' alone. Some of his smaller pieces, as for instance the 'Lines on receiving his Mother's Portrait,' and those addressed 'To Mary,' are exquisitely pathetic.

His translation of Homer is unequal in execution, as might be expected in the case of a work of such length, and of an author subject to attacks of melancholy as Cowper was. But taken as a whole, and judged by those rules which should be applied to translations, it must be pronounced the best translation of Homer which we possess. He set out with a determination to seize, so far as he could, the real spirit of Homer; and if he has not always succeeded, his failure may be partly attributed to his failing health and the circumstances under which it was written.

There are numerous lives of Cowper. The first is that by Hayley, and as such, and the work of Cowper's friend, it ought to be mentioned, though it was never of much value, and has been long superseded. The best life of Cowper, in every respect, is that of Southey: an edition of it in Bohn's 'Standard Library' includes the 'Private Correspondence,' which Southey was not able to publish in the original edition, though he embodied nearly all that was essential in it. A poem entitled 'Anti Thelyphthora,' being a satire against those who would do away with the institution of marriage, appears among Cowper's poems for the first time in Southey's edition.

* COX, DAVID, was born at Birmingham in 1793. About the commencement of the present century the representations of landscapes in water-colours from feeble and ineffective tinted drawings had been raised, chiefly by the genius of Girtin and Turner, almost to rivalry with paintings in oil. Among the many young artists who devoted themselves to this new art, David Cox soon distinguished himself by decided originality of style and familiarity with nature under many of her most striking aspects; and for some forty years he continued, amid the manifold fluctuations of artistic fashion, to pursue his own quiet course, at times neglected or depreciated, at others eagerly praised and patronised by the critics and connoisseurs, but always finding a goodly number of admirers. The common notion respecting his pictures is that they are mere rough sketches intended only to suggest, somewhat rudely and coarsely, certain natural 'effects' as they are designated. But however coarse and rude they may seem in execution, the works of Mr. Cox are the results not only of a close observance of natural phenomena, but of a well-considered method of conveying his own impressions. He paints on the roughest paper, and entirely disregards all minute details, and what is commonly called 'finish.' Yet though often seemingly mere hasty blots—the smaller drawings at least—his pictures convey to an eye that has observed scenes and circumstances such as are there depicted under similar conditions of season and weather, the broad general appearance—the poetic glance—of the whole view, with singular directness, fidelity, and vividness. Often indeed Mr. Cox seems to fail in realising his intention, but his successes are very striking. Rain and wind, bursts of sunshine over dark and lonely moors, long stretches of flat moist sands, dank herbage by the skirts of a marsh, the harvest or the hay-field with the brooding or the passing storm, and a score other of what had been regarded as among the scenes and phenomena to be rather avoided than sought after by the landscape-sketcher, he showed to be not merely full of poetry but also of singular pictorial capability. Of late years Mr. Cox has, it must be confessed, become more loose and rough in style, and his works have shown a more decided mannerism than ever; yet the old vigour is there, and not a little of the old truth and poetry. Some of his recent sunsets and more sombre effects have been equal to almost anything he ever painted.

Mr. Cox was one of the early members of the Society of Painters in Water-Colours, and in the gallery of that society his pictures have in

London been almost exclusively exhibited. Many years back Mr. Cox published a series of very suggestive lessons on water-colour painting, but they have long been out of print. He has for some years resided in the vicinity of Birmingham. Mr. Cox has a son, David, who is an associate of the Society of Painters in Water-Colours, and an able painter, but he appears inclined to imitate somewhat too directly his father's peculiar manner.

COXE, WILLIAM, archdeacon of Wilts, was born in London, March 1747. In 1768 he was a fellow of King's College, Cambridge. In 1771 he was appointed to the curacy of Denham, near Uxbridge, but soon after he went to travel on the continent as tutor to the Marquis of Blandford, son of the Duke of Marlborough, with whom he remained two years. In 1775 he accompanied in the same capacity Lord Herbert, son of the Earl of Pembroke, with whom he visited a considerable part of Europe. His 'Sketches of the Natural, Civil, and Political State of Switzerland, in a series of Letters to W. Melmoth,' 8vo, 1779, was translated into French with considerable additions by M. Ramond, a French traveller of taste and information, who rendered Coxe's work, which was rather dry and prosy, more attractive by adding many entertaining details. Coxe's attention had been chiefly directed to the political institutions of the numerous republics of the old Helvetic Confederation, a subject which had been already in some measure treated by Stanyan half a century before. Ramond travelled as a pedestrian through the most remote Alpine districts: he understood the dialects of the country, and in this respect had a great advantage over Coxe. He added to Coxe's work several entire letters, among others one in which he describes the striking scene, which few travellers have witnessed, of a general landsgemeinde, or assembly of the whole sovereign people of the canton of Glarus. Ramond's book is still one of the most interesting works upon old Switzerland, such as it was before the French invasion and subsequent changes. ('Lettres de Mr. W. Coxe sur l'Etat Politique, Civil, et Naturel, de la Suisse, augmentées des Observations faites dans le même Pays par le Traducteur,' 2 vols. 8vo, Paris, 1781.) In 1789 Coxe published a second edition, much enlarged, of his own work, under the title of 'Travels in Switzerland,' 3 vols. 8vo. The third volume is entirely engrossed by a description of the Grisons. Meantime in 1784, having visited the northern kingdoms of Europe, he published 'Travels into Poland, Russia, Sweden, and Denmark,' in 5 vols. 8vo, which were translated into French. Soon after the publication of this work he accompanied Mr. Samuel Whitbread on a tour on the continent, and in 1786 he went there again with the son of Mr. Portman, of Bryanston, Dorset. In 1788 he was presented to the rectory of Bemerton by the Earl of Pembroke. In 1794 he again visited the continent with Lord Brome, eldest son of the Marquis Cornwallis; and on his return was made chaplain of the Tower.

Coxe had collected a considerable store of information during his travels, of which he availed himself in writing several historical works, the most important of which is the 'History of the House of Austria from the foundation of the Monarchy by Rudolf of Habsburg to the death of Leopold II. in 1792,' 3 vols. 4to, London, 1807. It is a work of considerable labour and research, and conscientiously written. The author quotes in his preface and in the body of the work his authorities both printed and manuscript; and he also availed himself of oral information which he collected in his travels. The author has confined himself to the German branch of the house of Austria, leaving out the Spanish branch from Philip II. The work was translated into German, and seems to have been well received at Vienna. Coxe also wrote—1, 'History of the Kings of Spain of the House of Bourbon, from 1700 to 1788,' 3 vols. 4to, 1813. 2, 'Memoirs of John Duke of Marlborough, with his Original Correspondence,' 3 vols. 4to, 1817-19. 3, 'Memoirs of Sir Robert Walpole, Earl of Orford, illustrated with Original Correspondence and Authentic Papers,' 3 vols. 4to, 1798. 4, 'Account of the Russian Discoveries between Asia and America; to which are added, the Conquest of Siberia, and the History of the Transactions and Commerce between Russia and China,' in 4to. Gmelin, Pallas, Müller, and others had already treated these subjects, but Coxe has added more complete information which he collected at St. Petersburg. 5, 'Private and Original Correspondence of Charles Talbot, Duke of Shrewsbury, with King William III., the Leaders of the Whig Party, and Others.' 6, 'An Historical Tour in Monmouthshire, illustrated with plates from the drawings of Sir R. C. Hoare,' 2 vols. 4to. 7, 'An Account of the Prisons and Hospitals in Russia, Sweden, and Denmark, with Remarks on the Different Modes of Punishment in those Countries,' 8vo. 8, 'Literary Life and Select Works of Benjamin Stillingfleet,' 3 vols. 8vo; besides several minor works.

In 1803 he married Eleanor, daughter of Walter Shairp, consul-general of Russia. In 1805 he was appointed archdeacon of Wilts. After publishing the 'Memoirs of Marlborough,' in 1819 his sight failed him, and he became gradually blind. He died at Bemerton at an advanced age, in June 1828. Coxe, though a heavy writer, occupies a respectable place among modern historians: the subjects that he has treated are numerous and important; and he spared no pains to collect the best information, for obtaining which he had facilities of access to some important private collections. The following work was published after his death: 'Memoirs of the Administration of the

Right Honourable Henry Pelham, collected from the Family Papers,' 2 vols. 4to, London, 1829.

COXIE, MICHAEL, a very celebrated old Flemish painter, born at Mechlin, in 1497. He studied first under Bernard van Orley, and devoted afterwards much time to the study of the works of Raffaele at Rome, in which city he obtained some distinction as a fresco painter. He returned with an Italian wife, and with a good stock of Italian art, to his own country, where he enjoyed great renown and amassed a large fortune by his works. They were chiefly altar-pieces, and many of the best of them were carried to Spain, but he kept a considerable gallery of some of his choicest productions, in three houses or palaces which he possessed at Mechlin. He died at Antwerp in 1592, aged ninety-five, in consequence of a fall from a scaffolding, whilst engaged in painting a picture in the town-house of that place.

Though the works of Coxie had much merit, he is now better known for his elaborate copy of the 'Adoration of the Lamb,' in the church of St. Bavon, at Ghent, by the brothers Van Eyck, than for his own original productions. It is a large altar-piece with folding-wings, in two horizontal divisions, an upper and a lower division, each with two wings on a side; six of these wings are now in the royal gallery of Berlin, and the other parts are still at Ghent. Coxie's copy of the two centre pictures of this altar-piece is also in the Berlin Gallery, 'God the Father,' and the 'Adoration of the Lamb;' other parts are in the Pinakothek of Munich, and in the royal gallery of the Hague: in Munich are the large figures of 'John the Baptist' and the 'Virgin Mary;' at the Hague are all the wings. The copy was made by Coxie for Philip II. of Spain, and finished in 1559, after two years of uninterrupted labour, for which he was paid 4000 florins, about 400*l.* sterling. When painting this picture, Coxie complained to Philip that he could not procure a blue good enough to paint the Virgin's drapery with, upon which Philip wrote to Titian for some ultramarine, which Coxie received, and he used a quantity of the value of thirty-two ducats over the single blue mantle of the Virgin. The copy was painted with extreme care, and kept somewhat softer than the original; it remained for a long time in the chapel of the old palace of Madrid, whence it was removed and sent to Brussels by General Belliard during the French occupation of Spain. Can Bermudes says that Coxie himself took it to Spain.

(Van Mander, *Leren der Schilders*; *Kunstblatt*, No. 23-27, 1824; *Pannavant, Kunstreis durch England und Belgien*; *Waagen, Verzeichnisse der Gemälde-Sammlung des Königlichen Museums zu Berlin*.)

COYPEL, the name of a family of painters, eminent in the history of French art.

NOEL COYPEL, the first of the family who attained any reputation, was the son of Guyon Coypel, a younger son of a Norman family, and was born in 1628. Guyon practised painting, but apparently with little success. He placed his son at an early age with Poncet, a pupil of Vouet, a painter at Orleans, and afterwards under a painter named Quillerier. Noel rose rapidly in reputation, and was received into the Academy at Paris in 1663. He was appointed by the king director of the Academy at Rome, where he resided some time, enjoying the acquaintance of Bernini, Carlo Maratti, and other eminent painters of the day. Noel Coypel was a diligent student, and the French Academy in Rome profited greatly by his assiduous example. Having returned to Paris, he was successively made rector and director of the Academy. He died in 1707, working at his art to the last. To a certain extent he was an imitator of Nicolas Poussin, and by way of distinguishing him from the other Coypels he is often designated by French writers 'Coypel le Poussin.' His designs are skilful and spirited, but marred by affectation. Noel was married twice, and left two sons, Antoine and Noel Nicholas, and many daughters.

ANTOINE COYPEL, his father's pupil, was born in 1661, and accompanied his father to Rome, where he studied the works of the old masters. He afterwards travelled for improvement into Lombardy. He left Rome at the age of eighteen, but had made such progress in his profession, that at the age of twenty he was received into the Academy. In 1707 he was made professor and rector, and in 1714 director; in 1716 he was named 'painter to the king,' an office which had been for more than twenty years in abeyance; and in 1717 Louis XV. granted him titles of nobility. Antoine Coypel during life had a European reputation. He was by far the most famous of the family, and has much power and variety in his design; but the mannered style of the French school was not corrected by his study of the Italian, since he was too ready to adopt the artificial graces of Bernini, his friend and adviser. Many of his pictures have been engraved, some by himself, and others by eminent engravers of his own and the succeeding age. A large part of 'l'Histoire Numismatique du Règne de Louis XIV.' is executed from his designs. He wrote a 'Discours,' and an 'Eptre en vers,' on painting. He died in 1722, leaving one son, CHARLES, also a painter, and his father's pupil, who successively passed all the ranks to the highest in the Academy.

NOEL NICHOLAS, the second son and pupil of Noel, was born in 1692. He was received into the Academy in 1720, during his brother's rectorate. He did not attract much notice until after his brother's death, but then rose rapidly in reputation till the time of his own death, in 1734. Noel Nicholas, although not free from the factitious elegance of his relatives, possesses a considerable feeling for

pastoral enjoyment, which is evinced in some rustic compositions. The principal works of all the Coypels are at Paris.

COYSEVOX, ANTOINE, a distinguished French sculptor, was born at Lyon in 1640: his family was originally Spanish. He distinguished himself at Lyon as early as his seventeenth year by a statue of the Virgin, and he went afterwards to Paris to perfect himself under Lórambert. He was scarcely twenty-seven years of age when he was chosen by the Cardinal de Fürstenberg to decorate his palace at Saverne in Alsace, in which he was occupied for four years. After the completion of these works he returned to Paris with a reputation equal to that of any of his Parisian contemporaries, and he was elected a member of the Academy in 1676. He made two bronze statues of Louis XIV., one for the court of the Hôtel de Ville, and the other, a colossal equestrian statue, for the States of Bretagne. Among his most celebrated works are the two winged horses, in marble, mounted by 'Fame' and 'Mercury,' placed one on each side of the entrance to the garden of the Tuileries from the Place de la Concorde; they were originally in the garden of Marly: the marble is most elaborately worked, but they show considerable manner. The horse of 'Mercury' has a bridle, and that of 'Fame' is without one, a conceit which is said to have much pleased Napoleon. In the garden of the Tuileries there are also a young fawn, a flute-player, and two other figures, by Coysevox. He made also for the garden of Marly the groups of 'Neptune' and 'Amphitrite,' for Chantilly the marble statue of the great 'Condé,' and many works for Versailles, including two personifications in bronze of the rivers Dordogne and Garonne. Some also of the finest sepulchral monuments in Paris are by Coysevox, those of—Cardinal Mazarin at Quatre Nations, Prince Ferdinand de Fürstenberg at St.-Germain-des-Prés, Mansard at St. Paul; and the most elaborate of all, that of Colbert at St. Eustache. Coysevox was also an eminent sculptor of busts. When he died, in 1720, he was chancellor of the Royal Academy of Painting and Sculpture. (*De Fontenai, Dictionnaire des Artistes, &c.*; *D'Argenville, Vies des fameux Architectes et Sculpteurs*; *Galvani, History of Paris*.)

CRABBE, GEORGE, was born at Aldborough, in Suffolk, on the 24th of December 1754. His parents were in an humble condition of life, the father being a warehouse-keeper, and collector of the salt duties, or saltmaster, at Aldborough. The future poet showed, at a very early age, a taste for reading, and a delight in everything that bore the shape of poetry; and his father was thus led to give him an education better than he could well afford. It was determined that he should follow the profession of a surgeon; and having made some progress in mathematics at school, and also, as his son expresses it, "laid the foundations of a fair classical education," he was in his fourteenth year apprenticed to a surgeon at Wickham Brook near Bury St. Edmunds. He stayed with this surgeon three years, and, not having been well treated, was, in 1771, transferred to another at Woodbridge in Suffolk, with whom he finished his apprenticeship. His father had been in the habit of taking in a periodical, called 'Martin's Philosophical Magazine,' the last sheet of which was always devoted to "occasional poetry;" and when, at the end of the year, he sent the magazines to be bound, these sheets of poetry were contumeliously cut out, and became the property of George. He read them over and over again, and when yet very young tried to write pieces of poetry himself. Neither school nor surgery deprived him of the taste formed thus early. While at Wickham Brook he filled a drawer with verses, and at Woodbridge, having written a poem on Hope for a prize offered in 'Whible's Lady's Magazine,' and having been successful, he was induced to go on contributing to the publication in which he had gained his first laurels, and before his return home published in a separate form, but anonymously, a poem entitled 'Inebriety.'

He returned home at the close of 1775, and had now for a time to submit to the drudgery of the warehouse, until his father could afford to send him to London in order to complete his medical education. When at last he went, it was with means too scanty to allow of his gaining any real advantage; and he returned before a year had expired, but not till his resources, though carefully husbanded, had been exhausted. Shortly after, he was encouraged by his friends to set up as a surgeon and apothecary. He had never, it appears, liked his profession, though, impelled by a sense of duty, he had made more than one effort to apply himself to it with diligence. His preparation for the duties which he was now liable to be called upon to perform had been inadequate; and added therefore to dislike of those duties was uneasiness under the responsibility which attached to him. He was in love, and the object of his attachment (we quote his son's words) "too prudent to marry, where there seemed to be no chance of a competent livelihood; and he, instead of being in a position to maintain a family, could hardly, by labour which he abhorred, earn daily bread for himself. He was proud too; and, though conscious that he had not deserved success in his profession, he was also conscious of possessing no ordinary abilities, and brooded with deep mortification on his failure." After a short struggle with himself, he resolved to abandon his profession, and proceed to London as a literary adventurer. Being without money, he wrote to Mr. Dudley North, whose brother, Mr. Charles Long, had been a candidate for Aldborough, requesting the loan of five pounds. "A very extraordinary letter it was," said Mr. North some years afterwards to

Crabbe, when they met on terms of equality; "I did not hesitate for a moment." Thus provided with money he embarked on board a sloop at Aldborough, and, working his way, arrived in London in April 1780.

He took lodgings near the Exchange, and set about authorship with vigour. He projected the publication of a prose work, entitled 'A Plan for the Examination of our Moral and Religious Opinions'; but thought it expedient, before publishing this, to make himself known by a poem. Two poems, prepared with this view, were rejected by the booksellers to whom they were offered. He now published, on his own account, a poem entitled 'The Candidate'; but almost immediately after it appeared the publisher failed, and all hopes of profit from this attempt were thus taken away. His stock of money meanwhile had gradually disappeared, and he was reduced to great distress. He had been advised at Aldborough to apply for assistance to Lord North: he did so, and received none. He then applied to Lord Shelburne and Lord Thurlow, inclosing some of his poems to both; but these applications were equally unsuccessful with the former. At last, and not till after he had been threatened with arrest, he bethought himself of Burke. The letter which he addressed to Burke is a beautiful piece of writing, simple, dignified, and pathetic. "The night after I delivered my letter at his door," he told Mr. Lockhart some years after, "I was in such a state of agitation, that I walked Westminster bridge backwards and forwards until daylight." Burke immediately appointed a time at which he would see Crabbe; he received him with great kindness, and encouraged him to show him all his compositions. Having selected the 'Library' and the 'Village,' and having suggested in them many alterations which Crabbe assented to, he took these poems himself to Mr. Dodsley. The 'Library' was in consequence published in 1781. But Burke's attention did not stop here. He assisted him with money, and gave him a room at Besonsfield, where he was treated in every way as one of the family; he introduced him to Fox, Sir Joshua Reynolds, Lord Thurlow, and other distinguished friends; and having advised Crabbe to think of entering the church, towards which he found him by no means disinclined, he exerted all his influence to get him ordained. His conduct towards Crabbe is indeed a brilliant chapter in the history of Burke.

Crabbe was admitted to deacon's orders in December 1781 by Dr. Yonge, bishop of Norwich, and was ordained a priest in August of the year following. He commenced his clerical life as curate of his native town. Shortly after he obtained, through Burke's influence, the situation of domestic chaplain to the Duke of Rutland, and resided in consequence at Belvoir Castle. The 'Village' appeared in 1783, having been revised by Dr. Johnson: its success was great, and Crabbe's reputation was now fully established. In the same year Lord Thurlow, who had taken a previous opportunity of apologising for his first rapulae of Crabbe, presented him with two small livings in Dorsetshire, telling him, as he gave them, that "he was as like Parson Adams as twelve to the dozen." Crabbe now married Miss Sarah Elmy, the object of his first love. The Duke of Rutland had been in the meantime appointed lord lieutenant of Ireland. Crabbe did not accompany him to Ireland, but apartments in Belvoir Castle were assigned to the young married couple. In 1785 Crabbe took the neighbouring curacy of Strathern, and removed from the castle to the parsonage of that parish.

Crabbe published the 'Newspaper' in 1785. He did not come forward again as an author until 1807, when after an interval of twenty-two years appeared the 'Parish Register.' He resided in the meanwhile successively at Strathern, at Muston in Leicestershire (Lord Thurlow having in 1789, at the Duchess of Rutland's earnest request, exchanged his two small livings in Dorsetshire for those of Muston and Allington, both situated in the Vale of Belvoir); from 1792 to 1796 at Parham in Suffolk, taking charge of the neighbouring curacies of Sweffling and Great Glemham; then in Great Glemham Hall, a house belonging to Mr. Dudley North, his early benefactor; until at last, in 1805, he returned to his rectory at Muston. Though during this long period Crabbe published no poetry, he was not idle. He studied botany, which had always been a favourite pursuit, with great ardour; and wrote an essay on botany in English, which he was on the point of publishing when, yielding to the remonstrances of a vice-master of Trinity College, Cambridge, against degrading the science by treating it in a modern tongue, he consigned his manuscript to the flames. He also pursued entomology and geology. He taught himself French and Italian, and superintended the education of his sons. He was also, according to his son's account, continually writing; and among his compositions during this period were three novels, which, upon his wife's suggesting that the tales would have been better in verse, he consigned to the same fate with the essay on botany.

Together with 'The Parish Register' there appeared, in 1807, 'Sir Eustace Gray' and other smaller pieces, and a reprint of his earlier poems; the object of the publication being to enable him to send his second son to Cambridge. Three years after he published 'The Borough.' In 1813 he sustained a heavy affliction in the loss of his wife; and it was a fortunate circumstance, at a time when every scene at Muston would excite a painful remembrance, that the Duke of Rutland, the son of his former patron, gave him the living of Trowbridge in Wiltshire. The incumbency of Croxton near Belvoir was added shortly after.

The remainder of Crabbe's days were, with the exception of occasional visits to his friends in London and elsewhere, passed at Trowbridge, where his conscientious discharge of his duties and his amiable character gained for him the love of all his parishioners. When in London he was much courted by those among the great who are studious to derive distinction from the patronage of literary men: and he made the acquaintance of most of those who, during his retirement, had earned for themselves fame in his own vocation—Rogers, Moore, Campbell, Wordsworth, Southey, and Sir Walter Scott. His 'Tales of the Hall' were published in 1819 by Mr. Murray, who gave him 3000*l.* for them and the remaining copyright of his previous poems. In the autumn of 1822 he visited Sir Walter Scott at Edinburgh. From 1823 there was a perceptible change in his health, and though his mind retained its wonted cheerfulness, his strength of body gradually declined. He died on the 3rd of February 1832, in his seventy-eighth year. The shops in Trowbridge were closed as soon as his death was known, and again on the day of his funeral; and a subscription was immediately set on foot among his parishioners for a monument to their departed rector, which has since been placed in Trowbridge church.

The moral character of Crabbe is an almost perfect model. Its greatest fault was an excess of gentleness. Rising from a very low situation in life, he came to associate much with those whom the world sets up for worship; but, under circumstances whose corrupting influence few have withstood, he never lost that habit of self-dependence without which there is neither dignity nor happiness. Joined with an indifference to factitious distinctions, was an absence of all pride occasioned by his own intellectual eminence. He was meek, observant of merit in others, and eager to impart to those who were, as he had been, distressed, a share of the advantages which his own good fortune had procured for him. As a husband, father, and friend, he was without reproach. His son's account of the manner in which his days were passed at the parsonage presents a delightful picture of domestic happiness.

The distinguishing excellences of Crabbe's poetry are simplicity, pathos, force, and truth in describing character. He has said himself that all his characters were taken from persons whom he had seen and known. Observing these closely, and specifying each *trait* and minute circumstance, he presents his readers with representations not of classes of men, but of individuals. It is the minute accuracy of these representations that constitutes their charm. Who can forget Isaac Asklford! The celebrated descriptions of the parish workhouse, and of the "disputatious crew" of thieves and smugglers in 'The Parish Register,' show the same faculty of minute observation, and have the same charm of faithful delineation. There are also in his poems some good descriptions of natural scenery, for instance, at the commencement of 'The Village;' but then it is only scenery of the sort for which what Jeffrey called his "Chinese accuracy" is fitted. Crabbe had little inventive power. Viewing him moreover not merely as a poet whose business is to please, but as one possessing powers which it is his duty to employ for the improvement of his fellow men and the increase of social happiness, it may be fairly objected to him that he has seldom gone beyond the representation of existing evil, or taught how the poor, of whom he is emphatically called the poet, may be made wiser, and better, and happier.

An edition of Crabbe's poems in 8 vols. was published by Murray in 1834. The eighth volume consists of a collection of tales in verse, then published for the first time, which will not add much to the author's reputation. The 'Life' by his son, the Rev. George Crabbe, a very pleasing piece of filial biography, occupies the first volume.

CRABTREE, WILLIAM. [See HORROX, JEREMIAH, as very nearly all that is known of Crabtree arises from the correspondence of the two.]

CRAIG, JOHN, born in 1511, was educated at St. Andrews, Scotland, and then became a tutor in England to the children of Lord Dacre. Returning to his native country when the two kingdoms were involved in war, he entered the Dominican order, but was shortly afterwards imprisoned on a suspicion of heresy. On regaining his liberty, he went into England again, thence to France, and finally to Rome, where his talents recommended him to the notice of Cardinal Polo, under whose direction he entered the Dominican order at Bologna. Here he became entrusted with the education of the novices, and was also employed in various ecclesiastic missions throughout the continent; and for his important services was rewarded by the appointment of rector to one of the schools of the order. Having afterwards become a convert to the opinions of Calvin, he was seized, and accused of heresy, then sent to Rome, where, after an imprisonment of nine months, he was summoned to stand his trial before the court of Inquisition. Here he made a bold confession of his faith, and, being accordingly convicted, was condemned to be burnt.

It happened however that on the night previous to the day on which this sentence was to be put in execution, the pope died, and the populace rejoicing to be free from his yoke, rose in a tumultuous manner, and broke open the prisons. Craig came forth from his cell, and fled to Vienna, whence, after remaining there a short time, he was dismissed by the emperor with letters of safe-conduct, under the protection of which he passed through Germany into England, and thence to Scotland, where he arrived soon after the establishment of the

Reformation. He preached for a short time in Latin to the learned in St. Magdalen's chapel, when, having recovered his native language, he was appointed minister of Holyrood House, and became a principal coadjutor of Knox, the great Scottish reformer, in the work of reformation. He was afterwards appointed minister of Montrose, and in 1574 minister of Aberdeen, in which capacity he was chosen Moderator of the General Assembly of the church of Scotland, which met in October 1576. The following year he was removed to Edinburgh; and in 1579 was associated with the learned John Duncanson as minister to the royal household.

Craig drew up the National Covenant in the year 1580; he was also the author of two theological works; the one an answer to an attack on the Confession of Faith, the other a form of examination entitled 'Craig's Catechism,' which was appointed by the General Assembly to be used in schools and families in place of the 'Little Catechism.' He died at Edinburgh on the 12th of December 1600, at the advanced age of 89; but for some years before had performed no public duty.

(McCrle, *Melville*; Tytler, *Life of Sir Thomas Craig*.)

CRAIG, JOHN. The dates of his birth and death are unknown; but he was alive in the interval 1685-1718. He was a Scotchman by birth, and was rector of Gillingham, in Dorsetshire. He deserves remembrance as one of those who were active in developing the principles of the theory of fluxions after its appearance. His writings are partly in the 'Philosophical Transactions,' and partly published separately. The latter are, 'De Calculo Fluentium,' London, 1718, with two books, 'De Opticæ Analyticæ,' 'De Figurarum, &c., Quadraturæ,' London, 1698. There had previously, in 1685, appeared a tract on the same subject. 'Theologiæ Christianæ Principia Mathematica,' London, 1699, a very silly attempt to apply numerical reasoning to historical evidence. He concludes from a formula that the evidences of Christianity will be extinct by lapse of time in 1454 years from 1696, or A.D. 3150, at which date he therefore places the commencement of the Millennium. Craig is called by some continental writers the introducer of the Leibnitz' theory of fluxions into England.

CRAIG, SIR THOMAS, of Riccarton, was, according to Baillie's biographical notice of him prefixed to the last edition of his celebrated treatise on the 'Feudal Law,' the son of Mr. Robert Craig, merchant in Edinburgh, and born about the year 1548; but this is plainly a mistake, for in 1552 he was sent to the university of St. Andrews, and entered as a student of St. Leonard's College. He remained at St. Leonard's only till he proceeded Bachelor of Arts, when he went to France to prosecute his studies in the University of Paris. On his return to Scotland, about 1561, the Reformation had just been accomplished there; and under the care of his distinguished relative, the Rev. Dr. John Craig, then minister of Holyrood House, the religious views of young Craig were changed; and, devoting himself entirely to study, he left nearly all his youthful contemporaries in literature far behind him. He passed advocate in the Court of Session at Edinburgh on the 2nd of February 1563, and in July of that year we find him justice depute to Archibald, fifth earl of Argyll, hereditary lord justiciar of Scotland ('Abstract Books of Adjournal, MS. Adv. Libr.'), an ardent friend of the Reformation. In May 1564 he had a grant from the crown of the escheat of Alexander Innes of Crombie, and in the following January another grant from the crown of the unlaws or amerciements of any six persons he might choose among those unlawed in the justice courts, and this so long as he should enjoy the office of justice depute. In October of the following year the grant was extended for his life. His first appearance as an author was on occasion of the queen's marriage with her cousin Darnley, for which he composed an epithalamium, or marriage-song. The piece, which is not to be found among Craig's poems in the 'Delitæ Poetarum Sæculorum,' was only discovered a few years back.

In his office of justice depute Craig appears to have been particularly zealous. On the 18th of December he had a grant from the crown of the escheat of Alexander Dunning of Westercrieff, and the week following a grant of the escheat of James Johnston in Middlegill and others. In looking at these grants of escheat, we must bear in mind that in those times the judges were commonly paid out of the issues of their court, and it is probable that Craig had then no other source of remuneration. In 1574 however, when he was promoted in his profession, he received from the lord treasurer 120*l.*, being his fee as justice depute for three years from Whit-Sunday 1571, at the rate of 40*l.* a year, which was an allowance equal to that then paid to the lord advocate. Craig presided in the court of justiciary held in April 1566, where Thomas Scot, the sheriff depute of Perth under Lord Ruthven, the hereditary sheriff, and Henry Yaire, a priest, servant to the Lord Ruthven, were adjudged to be hanged and quartered, and their heads set upon the turret of the buildings adjoining the royal palace, on the charge of having been accomplices in the murder of Rizzio, who was openly assassinated in the queen's presence by the Lord Ruthven, the Lord Chancellor Morton, and others, at the head of whom was Darnley himself. On the 19th of June following, the queen was delivered of a son, and Craig again appeared as a court-bard, hailing the birth of the young prince in a 'Genethliacum in Jacobi Principis Sæculorum.' He seems soon afterwards to have married Helen Heriot, daughter of the influential laird of Trabourne, in the county of Haddington; and in 1569 his eldest son Lewis was born.

Craig continued in the office of justice depute till the end of the year 1573, when he was appointed sheriff depute of Edinburgh under the Earl of Morton above mentioned, the hereditary sheriff; and Craig's younger brother Robert was made justice depute in his room. From the beginning of the year 1576 Craig was in the courts as a practising counsel down to the beginning of the year 1581. Morton was that year committed to Dumbarton Castle for his supposed concern in the murder of Darnley, and the same year Craig was ordered to enter his person in ward in the same castle of Dumbarton. Craig at last obtained his liberty, but was not replaced in the office of sheriff depute. In April of the above year 1576 Craig got a crown charter of the estate of Craigfintray, in the county of Aberdeen, to himself and his heirs male. In April 1588 he obtained a crown charter of the lands of St. Lawrence Houses, in the county of Haddington, to himself and Helen Heriot, his wife; and from about that time forward we find him again in practice at the bar. He resumed also his poetic pen, and wrote some commendatory lines to Jacks Onomastichon, published in 1592.

It was probably about this time that Craig contemplated his great work on the feudal law. Such a work was in a manner new to the law literature of Scotland. But Craig narrowed his powerful mind, its fancy and genius, and all its accumulated stores of learning and experience, to a temporary object; and to adopt the sentiment if not the language of one who had weighed his merits, instead of seizing the precious opportunity he enjoyed of presenting to his country a just system of her national jurisprudence, he not only passed by the evidences of her common law which lay beside him, but endeavoured to sink them into oblivion in favour of the civil and feudal laws. (Ross's 'Lectures,' vol. ii. pp. 9, 10.) He had scarcely risen from his learned labours however when he found that Elizabeth was on the eve of her demise, and that various intrigues were carrying on and cabals formed to secure her crown, with a view to the king's succession, to which his treatise on 'Feuds' was composed. On the 1st of January 1603 therefore, he dedicated to the king a treatise on the 'Succession to the Throne of England,' which he had written in confutation of the jesuit Parsons' 'Conference on the Disputed Succession,' wherein the right of the people to choose their king was boldly reasoned, and the crown indirectly claimed for the Infanta of Spain. But in less than three months after, the queen repeated on her death-bed her former declaration that her cousin the king of Scots should be her successor. James accordingly ascended the throne of England without dispute, and Craig's reply to Doileman was never printed.

On the king's departure for England with his family, Craig wrote a 'Paræneticon' of congratulation, and on the same occasion a 'Pro-pempticon,' or farewell poem, to the young prince Henry. The same year he composed his 'Stephanaphoria,' in honour of the king's coronation; of which ceremonial Craig seems to have been a witness, having in all likelihood accompanied the royal party into England; and previous to his return home he addressed to the king a short poem, in which he took a solemn farewell of his majesty, and at the same time of the Muses.

Soon after his return Craig was appointed one of the commissioners nominated by the parliament to meet with commissioners from England and treat of a union between the two kingdoms, and thereupon in the summer of 1605 he wrote his treatise on the union. About the same time he wrote his treatise on homage, to vindicate Scotland from the charge of feudal dependence on the crown of England, brought against it in the chronicles of Hollinshed. Neither of these works was ever published. In the year 1606 Craig held the office of advocate for the Church of Scotland, and some time before his death, as he would not formally accept the honour of knighthood, the king commanded that he should be everywhere saluted by the style accorded to that honour. He died on the 26th of February 1608, when he had been upwards of forty-five years at the bar, and probably therefore when he was not much short of seventy-five years of age.

* CRAIK, GEORGE LILLIE, was born in Fifeshire in 1799, the son of a schoolmaster. At the university of St. Andrews he went through the usual course of a divinity student, but he did not take licence as a preacher. He had contracted an early taste for literature, and after giving some lectures on poetry in Scotland he came to London in 1824. For a short time, among other things, he was connected with the 'Verulam,' a weekly literary and scientific newspaper, started under high patronage, but which had a very short existence. Soon after the Society for the Diffusion of Useful Knowledge commenced its operations, Mr. Craik wrote the 'Pursuit of Knowledge under Difficulties,' forming two volumes of the series of 'Entertaining Knowledge' edited and published by Mr. C. Knight. These volumes appeared in 1831, and though issued without his name, established a reputation for Mr. Craik as a writer of extensive and varied acquirements. Mr. Craik, from the commencement to the close of the 'Penny Cyclopædia,' was one of the most valuable contributors in history and biography. In 1839 Mr. Craik became the editor of the 'Pictorial History of England,' and he principally wrote the chapters on Religion, Constitution, Government, and Laws, National Industry, and Literature. Some of these chapters were subsequently formed, with additions, into separate works; namely, 'Sketches of the History of Literature and Learning in England from the Norman Conquest to the Present Time,' in 6 vols; and a 'History of British Commerce from

the *Earliest Times*, in 3 vols. These appeared in 1844 in the series of 'Knight's Weekly Volume,' as did also 'Spenser and his Poetry,' in 3 vols., in 1846; and 'Bacon, his Writings and his Philosophy,' in 1846. In the same series, in 1847, he issued a concluding volume of the 'Pursuit of Knowledge under Difficulties,' containing female examples only. In 1849 Mr. Craik was appointed professor of history and English literature in Queen's College, Belfast, where he has ever since resided. Besides the works mentioned above, he is the author of the 'Romance of the Peerage,' in 4 vols., 1849-52; and 'Outlines of the History of the English Language,' 1855. The above are his principal literary labours, but he has also contributed largely to some of the reviews and other periodical works. Scrupulous accuracy, unwearied research, and sound criticism, united with an ardent desire for the safe and gradual advance of all that may practically improve the condition of society, are the leading characteristics of Mr. Craik's writings. Few have laboured more earnestly in the cause of general education.

CRAMER, GABRIEL, born 1704 at Geneva; died 1752 at Bagnols. He was professor of philosophy at Geneva, and author of a large number of works, for a list of which the 'Biog. Univ.' refers to Senebier, 'Hist. Litt. de Genève.' We have here only to mention him as the editor of the works of John and James Bernoulli, of the correspondence of the former with Leibnitz, and to notice his 'Analyse des Lignes Courbes Algébriques,' Geneva, 1750. This work is the largest collection of examples which exists, and is of permanent utility to elementary writers. So far as expressions entirely algebraical (as distinguished from transcendental) are concerned, it is a complete treatise on the elementary theory of curves.

CRANACH, LUCAS, one of the most celebrated of the old German painters, was born at Cranach, near Bamberg, in 1472. According to a prevailing custom of the time, he was called after the place of his birth, sometimes also Meister Lucas, and Lucas Mahler, or Luke the Painter, from which appears to have originated the false name of Lucas Müller; his family name was Sunder.

He was apparently instructed by his father, and in his twenty-third year (1495) was appointed court-painter to the Elector of Saxony; he served in this capacity the electors Frederic the Wise, John the Constant, and John Frederic the Magnanimous. In consequence of this appointment, Cranach settled in Wittenberg, the residence of Frederic the Wise, lived there forty-six years, and earned wealth and reputation in abundance; he was owner of several houses there, and was for many years burgomaster of the place. In 1498 he accompanied the elector Frederic the Wise to Palestine to the Holy Sepulchre, and made drawings of all that was remarkable and interesting there. For this elector Cranach painted a series of portraits of his ancestors. Cranach was particularly attached to the elector John Frederic, and when that prince was taken prisoner by Charles V., after the battle of Mühlberg, in 1547, he interceded with the emperor in his behalf, though to little purpose. Charles was well disposed towards Cranach, and requested him to accompany him to the Netherlands. He had a portrait of himself as a boy, by Cranach, at Mechlin, and he asked the painter when it was painted; Cranach informed him when he was eight years old, and that to attract his attention so as to enable him to paint the portrait, a beautifully painted arrow was stuck in the wall opposite to where the emperor sat. The narration pleased the emperor, and he dismissed him with a present of a silver plate of Hungarian ducats, of which however Cranach took very few; and he persisted in his refusal to accompany the emperor to the Netherlands. He would not leave his prince the elector John Frederic, with whom he shared his five years' imprisonment at Innsbruck, and upon his release in 1552 his eldest son and Cranach were his only companions on his return home. Cranach retired to Weimar, and died there in the following year, which was the eighty-first of his age, according to the inscription to his memory in the church of St. Jakob.

Cranach was acquainted with many of the principal men of his time and country: he and Luther were intimate friends, and he is said to have brought about the marriage of Luther and Catherine Bora. He appears to have painted Luther's portrait many times, nearly all of which have been engraved, some of them by several engravers. He was acquainted with Melancthon and Bugenhagen. Cranach had several sons and daughters: Johann, the eldest, studied painting in Italy, and died young at Bologna in 1536; another son, Lucas Cranach the younger, was born in 1515, and died in 1586 as burgomaster of Wittenberg, and with the reputation of a distinguished painter. After Cranach's death a medal was struck at Wittenberg to his honour, with his portrait on one side, and the arms granted to him by Frederic the Wise in 1508, consisting in a crowned winged serpent upon a gold ground, on the other.

The principal works of Cranach were executed between 1506 and 1540, and they are nearly all still in Germany, especially in Upper Saxony. In the Dresden Gallery there are twelve, in that of Vienna fourteen, at Munich eight, and at Berlin there are twenty-three attributed to him, but they are mostly of small dimensions. His masterpieces are his altarpieces in various Saxon churches, and one of the principal of these is the large mystical representation of the 'Crucifixion' in the church of Weimar. It is painted on a large panel, with folding wings, which are painted on both sides. The

composition is scarcely intelligible, and is selected without taste; it contains portraits of John Frederic and his family, and of Cranach and Luther, which are the best figures in it; it is executed with all the laborious care and exactness of the best German painters of that period. Cranach was inferior to Albert Dürer alone in his best period, and Dürer's superiority is confined to design and composition. A description of this altarpiece—more remarkable for its execution, size, and singularity, than any other qualities—was published with engravings by H. Meyer, at Weimar, in 1813.

In colour, and in all respects except elegance of design, unity of effect, and composition, in which he was wholly deficient, Cranach was one of the most distinguished painters of his time; and in execution he was one of the most laborious artists that have ever lived. He was a good portrait painter, an excellent animal painter, and also a good miniature painter and illuminator of manuscripts. There are several manuscript volumes containing drawings in miniature by Cranach in the library of the University of Jena. Cranach is said to have also engraved both in copper and wood, and many works are attributed to him, but with very little certainty; there are however many prints in both styles after his works, but few of them probably were executed by himself.

There are many German notices of Cranach, more or less detailed, early and recent, and there are at least three distinct lives of him: the first was written by Professor Christ, and published in the 'Acta erudita et curiosa de Franconia,' Nürnberg, 1726; a second was published in 1761, at Hamburg, by C. E. Reimer, 'Historisch-critische Abhandlung über das Leben und die Werke Lucas Cranachs;' the last is the very full life by J. Heller, 'Lucas Cranachs Leben und Werke,' Bamberg, 1821; and Schadow's 'Wittenbergs Denkmäler der Bildnerei, Baukunst, und Malerei,' &c., Wittenberg, 1825, contains descriptions and engravings of works of both the Cranachs. Concerning the engravings and wood-cuts attributed to Cranach, see Bartsch, 'Peintre-Graveur.'

CRANMER, THOMAS, ARCHBISHOP OF CANTERBURY, the second son of Thomas Cranmer and Agnes, daughter of Laurence Hatfield, his wife, was born at Aslacton, in Nottinghamshire, on the 2nd of July 1489. The respectable family from which he descended had been settled in that county for some generations. His first instruction was received at a village school, from which he was removed by his mother, who had become a widow, and who placed him, in 1503, at Jesus College, Cambridge, where he became a Fellow in 1510-11. He applied with great diligence to the studies of the university: Greek, Hebrew, and theology were the principal objects of his industry. Before he was twenty-three years old Cranmer married a woman of humble station but respectable character, a kinswoman of the landlady of the 'Dolphin;' and having in consequence forfeited his fellowship, accepted the appointment of lecturer in Buckingham (now called Magdalene) College. The duration of this employment was very short; for in about a year after his marriage, his wife having died in childbirth, by a somewhat irregular proceeding he was restored to his fellowship at Jesus College. The agents of Wolsey, who had founded this celebrated college at Oxford, were now searching the kingdom for men of talent and learning to fill the vacant chairs in that establishment; and Cranmer was distinguished by them with the flattering offer of high and lucrative employment. After some hesitation, he refused the new dignities. In 1523 he took the degree of D.D. During his residence in the university, he had undertaken, in addition to his other duties, the charge of educating two sons of a Mr. Cressy, who was connected with him by marriage; and when the sweating sickness broke out in Cambridge (1528), retired to that gentleman's house at Waltham Abbey, where he was occupied with the instruction of his pupils and the prosecution of his studies. This change of residence influenced the remainder of his life. By order of Henry VIII., six men of learning had been chosen from each university to discuss the validity of his marriage with his brother's widow, Catharine of Aragon; and Cranmer, among others, was selected. His absence from Cambridge however prevented him from giving his assistance to the delegates, who finally elected a substitute in his place. Either accidentally or by design, Gardiner and Fox (afterwards bishops of Winchester and Hereford) being in attendance upon the king, who was on a journey, met Cranmer at Mr. Cressy's table, and inquired anxiously the opinion of so distinguished a man upon the all-absorbing matrimonial question. He replied, that although he had not given much consideration to the question, he thought the course to be followed appeared to be sufficiently simple. The case should be determined by reference to the Bible—should be settled by divines, the most proper persons to determine it, and by those of the English universities, who were as well fitted to entertain it as those of Rome or any foreign country. The report of this judgment, which was not wholly new, gave great satisfaction to the king, who immediately sent a messenger to require his attendance at the palace. Unwilling to forsake a life of study and retirement, Cranmer endeavoured to excuse himself from attending at court. His excuses however did not avail; and the reluctant adviser having been graciously received, was commanded to reduce his opinion to writing, and consigned to the hospitality of Lord Wiltshire, the father of Anne Boleyn. The opinion was soon written. It asserted that the marriage of Henry with his brother's widow was condemned by the authority

of the Scriptures, the councils, and the fathers; and that the pope had no power to give a dispensation for that which was contrary to the word of God. Cranmer having professed his willingness to maintain three positions in the presence of the pope, was acquainted with the king's intention immediately to send him to Rome. Pains were taken to make this judgment known. Cranmer himself disputed upon it at Cambridge, and brought several over to his opinion. He then returned to his attendance upon the court; and having been appointed chaplain to the king, and presented to a benefice and the archdeaconry of Taunton, joined the others who were associated with him in the embassy, and travelled to Rome about the close of 1529.

The ambassadors, finding all arguments unavailing to persuade Clement to favour the divorce, quickly returned to England. Cranmer alone remained in Italy. At length even his patience was exhausted by continued refusals to allow him to maintain in public the judgments of the English and foreign universities, which were for the most part favourable to the king's cause. The pope conferred on him, for the sake of conciliation, the empty title of 'Supreme Penitentiary,' and soon afterwards gladly saw him turn his back upon Italy (1530). In prosecution of the same business, Cranmer now went to France, and also to the Emperor of Germany—an expedition which, although it produced no decisive public result, led to an event of great private consequence to himself. Regardless of the Roman injunction for clerical celibacy, during this residence abroad he married (1532) a second time; the object of his choice being the niece of his friend Osiander, the pastor of Nuremberg. This imprudent act, which he could not avow, exposed him eventually to many unworthy evasions. It was not long after they were united, before Cranmer received news of Archbishop Warham's death (August 1532), and of Henry's intention to raise him to the see of Canterbury. He suffered four months to elapse, in the hope that the king might change his mind, and then unwillingly accepted this promotion, which the necessary oaths respecting celibacy and obedience to the pope rendered unacceptable: he was consecrated on the 30th of March 1533, making a public protestation, at the time when he swore submission to the pope, "That he did not intend by this oath to restrain himself from anything that he was bound to either by his duty to God, or the king, or the country." "By this," says Burnet ('Hist. Reformation,' vol. i.), "if he did not wholly save his integrity, yet it was plain he intended no cheat, but to act fairly and above-board." Afraid of a rupture with England, the pope accepted less than the usual fee.

Cranmer, soon after his appointment, discussed the king's cause in convocation; and having travelled to Dunstable, to which town the convocation adjourned in order to be near Queen Catharine's residence at Ampthill, he there (23rd of May 1533) declared the marriage null and void. Five days afterwards he publicly married the king to Anne Boleyn, a private marriage having taken place in the January previous. He also officiated at their coronation on the 1st of June, and stood sponsor to the Princess Elizabeth, who was born in the following September. The business of his office and parliamentary duty now occupied his time. With his assistance were passed several statutes, by which the power of the pope in England was materially diminished; the convocation and universities assented to these statutes, pronouncing that "the bishop of Rome has not any greater jurisdiction conferred on him in this realm of England than any other foreign bishop."

In 1534, when Sir Thomas More and Fisher, bishop of Rochester, refused the oath of supremacy, Cranmer's best endeavours were used in vain, first to overcome the scruples of the recusants, and afterwards to dissuade the king from executing the sentence that had been pronounced upon them. In this year, with the consent of the convocation, he set on foot a translation of the Bible, by dividing Tyndale's version of the New Testament into nine or ten parts, which he required the most learned bishops to revise; the translation was completed and ultimately printed at Paris. In 1535 Cranmer assisted in the correction of a second edition of the 'King's Primer,' a book containing doctrines bordering upon Protestantism, of which it has been asserted that the archbishop was originally the compiler. His continual study of the Bible, and the notes that he had collected upon all heads of religion, both from places in scripture, and ancient fathers and doctors, fitted him most fully for the undertaking. In August he wrote a curious letter (Strype) to the king, respecting the publication of his supremacy by the clergy, and urged him to the suppression of the monasteries, which he considered inconsistent with true and full reformation. Cromwell was now raised by the king to be head of his ecclesiastical affairs, under the title of Vicar-general, and Cranmer consecrated Latimer and Shaxton to the sees of Worcester and Salisbury. In 1536 died Catharine the divorced queen; and Henry being now tired and jealous of Anne Boleyn, soon got rid of her. Cranmer was forbidden the court, lest his presence might impede the proceedings against the queen, from whom he received uniform kindness. In virtue of his office he pronounced her marriage void (1536), and on the day after her execution the king was united to Jane Seymour. In June the archbishop opened the convocation, where Cromwell presided as vicar-general; the record of the late queen's divorce was sanctioned without the opposition of Cranmer or any other member. After much violent and useless discussion, the synod proceeded to debate upon the sacraments. Cranmer spoke at considerable length, and articles were afterwards framed by him, and

others of the 'new learning,' as the doctrines of the reformers were then called, by which considerable innovations were effected. The pope, who was watchful of the proceedings of England, threatened to assemble a synod, for the sake of passing censures upon Henry: in anticipation of which, Cranmer and others signed a declaration that the king need not obey their decisions, in case such an assembly was convened. With the assistance of many eminent divines, Cranmer arranged a compilation called the 'Bishop's Book,' inculcating the doctrines of the reformers as expressed in the articles of the preceding year. The king, to whom this book was submitted, himself inserted some corrections, from which the archbishop was bold enough to dissent. However ill Henry's temper might have brooked such contradiction from another, he bore it patiently from the archbishop, who had been his most useful friend, and we find that in the October of this year, when the queen gave birth to Prince Edward, the primate and the Duke of Norfolk stood sponsors at his baptism.

The destruction of the greater abbeys was now rapidly proceeding; and the funds which arose from them were lavished by Henry upon unworthy favourites, until Cranmer, who had hoped to apply them to the promotion of religion and education, remonstrated against their improper application. A sum of money was obtained for the foundation of some new bishoprics, but the king's prodigality could be checked no further. In the autumn of 1533 the primate came to London to meet an embassy of German Protestant divines, for whom he strove to procure a conference with the English ecclesiastics. To the great disappointment both of the ambassadors and the reformers, the king opposed their wishes, and directed Tonstal, a bishop opposed to the 'new learning,' to draw up an answer to the dissertation which had been compiled by the German divines.

On the 5th of May 1533, Cranmer and others were appointed commissioners "to inquire" (Le Bas, vol. i. 201) "into the debated doctrines, and to prepare such articles as would pacify the spirit of controversy." At the end of eleven days the labours of the commissioners coming to no result, the Duke of Norfolk offered six articles (Burnet, vol. i.) for the consideration of the House of Lords. Cranmer's opinion agreed only with one of these articles. Being desired by the king to explain himself in writing, he composed a treatise upon the case, which, with his secretary, to whom it was intrusted, became the subject of a singular adventure. (Burnet, vol. i.) In parliament he argued for three days with considerable learning and eloquence, until the king, who favoured the articles, angrily desired him not to appear again in that house until they became law. Cranmer, obedient to Henry in most points, in this respectfully resisted the king's commands; but although he continued present, he was unable either to throw out the Duke of Norfolk's measure or to alter the sanguinary penalties which it contained. As soon as this act was passed, Latimer and Shaxton resigned their bishoprics, an example which, contrary to expectation, the archbishop did not think it his duty to follow. He retained his see, and lived in retirement with his wife, who however was soon compelled to retreat to Germany.

In July 1540 the primate presided at the convocation which pronounced the unjustifiable sentence of dissolution of the marriage which had been solemnised between Henry and Anne of Cleves. This ceremony was quickly followed by the execution of Cromwell. The misconduct of Catherine Howard, whom Henry had married as soon as he had put away his former queen, coming to the knowledge of the archbishop, he undertook to report her profligacy to the king (1541). After an investigation, the proofs of her crimes were held to be conclusive: she was condemned, and after a delay of some weeks, during which time Henry, through a message, of which Cranmer was the bearer, promised to spare her life, she was executed.

The maintenance of the ground that the Reformation had gained, and the extension of it where possible, now (1542) became the sole occupation of Cranmer, who had transferred to the universities the task of revising a new edition of the Bible published the year before. This revision it had been proposed to apportion among the bishops, requiring an English version of a part from each, whatever might be his opinions. This was considered a step gained, as it certainly was the preferable method; and notwithstanding the reformers did not in all things prevail (for a prohibition against Tyndale's Bible was secured by their opponents), they had still further success in procuring an order that the scriptures should be read in English by the ministers in the church service. In a minor degree Cranmer's attention was occupied in repressing the excesses of luxury in which some ecclesiastical establishments as well as the bishops had indulged.

In May 1543 appeared the 'King's Book,' which was in fact little more than a new edition of the 'Institution,' altered in some points by the papal party: it received its name from the preface, which was written in Henry's name. The clergy being hostile to this book, Cranmer, at a visitation of his diocese, in submission to the king's supremacy, forbade them from preaching against any portions of it, however they or he himself might dissent from them. The exertions which he had used for the correction of his diocese, in which religious variance was at a great height, were watched and examined by his political adversaries, who hoped to found on them such accusations as would ensure his ruin. The prebendaries of Canterbury and some magistrates in Kent, encouraged by Gardiner, after holding a succession of meetings, finally drew up articles accusing Cranmer of

abusing his power. These charges were submitted by the prebendaries to the council, and by the council to the king. Henry immediately caused the accusation to be sifted by a commission, who declared them to be unfounded; and the authors of the conspiracy afterwards submitted themselves to Cranmer, who refrained from bringing them to punishment.

In 1544 Cranmer successfully exerted himself in parliament to carry a bill to mitigate the severity of the statute of the Six Articles. He also assisted in compiling an improved English Litany, essentially similar to that which is now in use. Difficulties however were increasing around him, and he had the dissatisfaction of seeing the seals, which were now resigned by Lord Audley, his personal and political friend, conferred upon Lord Wriothesley, an adherent of the Roman Catholic party. By this appointment, as well as by the death of the Duke of Suffolk, it was expected that the king's favour towards the reformers might be weakened. Nor indeed was it long after Suffolk was in his grave before Cranmer, who, with three others, had been associated with the queen in the government of England during Henry's temporary absence in France, had reason to feel his loss. The Duke of Norfolk and other members of the privy council accused him of spreading heresies through the land, and prayed the king that, for the safety of his dominions, the archbishop might immediately be committed to the Tower. Henry, on the same night that the accusation was received, caused Sir Anthony Denny to carry a message to Cranmer, who rose from his bed to attend upon the king at Whitehall. The council assembled on the following morning, and summoned before them the primate, who had been insultingly kept for an hour in a servants' waiting-room. At length sentence of imprisonment was passed upon him, but, to their surprise and confusion, he produced the signet of the king, from whose hands he had received it the night before. The council did not venture to proceed any further in the case.

After a peace had been concluded with France (1546), Anbault, the French admiral, came to England. A resolution was made by him, and sanctioned by the king, that the Reformation should be proceeded with, and that in both countries the mass should be changed into a communion, the form of which Cranmer was ordered forthwith to draw up. This was the last year of Henry's reign.

The king, who of late had grown so corpulent and unwieldy that he was raised up and let down the stairs by a machine, after an illness of some weeks sank under his disease on the 27th of January, 1547. Cranmer was named one of the executors of his will, and one of the regents of the kingdom.

On the accession of Edward, who had not yet completed his tenth year, and the better to establish his supremacy, the bishops received anew their bishoprics at his hands. The first public act of the primate was the coronation of the new king (February 20, 1547), and the delivery of a short address which he then substituted for the customary sermon. No one that heard the expressions of the archbishop could hope for the restoration of papal supremacy; all things indeed betokened a still further extension of the Reformation. An inquiry into the state of religion, by means of a visitation of the whole kingdom, was immediately set on foot: twelve homilies, four of which are ascribed to Cranmer, were drawn up, and ordered to be placed in every church, with the translation of Erasmus's paraphrase of the New Testament, for the instruction of the people. It is true that these measures, though they had many supporters, met with frequent opposition. Gardiner continued to argue, both in person and in writing, against the homilies and the paraphrase, which the Bishop of London also proclaimed to be heretical. Nevertheless Cranmer's influence prevailed; and when he produced in convocation an ordinance that the laity as well as the clergy should receive the sacrament in both kinds, the proposition passed unanimously, and soon after obtained the sanction of the legislature. By the same parliament the Act of the Six Articles and other severe statutes were repealed.

During this winter session of parliament it was proposed to confer upon the king such chapels, chantries, and colleges as had escaped his father's grasp. There were few subjects upon which Cranmer's opinion coincided with that of the Roman Catholic party, but in this case he joined their ranks, and voted in opposition to the bill. He now (1548) revived the proposal for substituting a communion office for the mass, and a service was framed in time to be circulated to the clergy for their use at the following Easter.

The more considerable labours which occupied the Protestants at this time still remain to be told. An English translation of a catechism which had been written in German and in Latin by one Justin Jonas, was published by the archbishop, entitled 'Cranmer's Catechism.' In the month of May a commission of twelve divines, with Cranmer at their head, was appointed for the compilation of an English liturgy. Nor were these the only additions to the ordinary duties of the primate: he took charge of a bill, which was passed, permitting marriage among the clergy. By the end of November the Prayer-Book was finished, and on the 15th of January, 1549, legal sanction was given to it. Great opposition was made to these changes in different parts of England, in Wiltshire, Somersetshire, Norfolk, and especially in the west, where at the instigation of their religious teachers, the people took such weapons as they could procure, and mustered in considerable force. The legislature, anxious to quell this disturbance,

desired Cranmer to draw up an answer to fifteen articles of remonstrance which had been framed by the insurgents. A very masterly reply (Styrie's 'Cranmer,' Appendix 40) was written, but not completed before the leaders of the insurrection were apprehended and executed, and the rebels had dispersed. It would have been more to the honour of the archbishop if the spirit that pervaded his reply had been carried into a commission at which he presided for the suppression of certain heresies, for he would then have escaped the stain of having condemned two persons to the stake; but however amiable and forbearing was his general disposition, no excuse can be offered for him or for his friends Ridley and Goodrich, who, with others, were implicated in this affair. Upon the condemnation of Lord Seymour (1549) Cranmer signed the warrant for his execution, notwithstanding the canon law set forth that no churchman should meddle in matters of blood. Whatever may have been the primate's conduct towards Seymour, towards his brother the Protector Somerset it was unexceptionable: from the time that his distresses commenced till his execution was effected by the enemies whom the weakness of his character and elevated station had created, he retained Cranmer's firm and invariable friendship. Bonner, the bishop of London, was now degraded by commissioners, of whom Cranmer was one. When this commission was dissolved, an ordinance was signed by the primate, the chancellor, and four others of the council, for the abolition of Roman Catholic books of devotion; an addition was also made at this time to the ritual that had been substituted for them, in the shape of a formulary for ordination; and other steps were taken by the primate in order to diffuse a better knowledge of the creed of the Protestants. At Lambeth he received the most eminent foreign divines, Martin Bucer, Pagius, Peter Martyr, and several more.

Cranmer was greatly troubled at the discussions of the clergy respecting the removal of altars from the churches and the placing of communion tables in their stead. This had been done (1550) partly at the recommendation of Hooper, a divine who had been driven from England by the Act of the Six Articles, and who, during his residence abroad, had adopted very scrupulous opinions. In July, Hooper was made bishop of Gloucester: and soon after Cranmer received from him a refusal to wear the usual episcopal habits. This question, upon which the primate himself seems sometimes to have hesitated, was now brought to an issue. If a dignitary of the church had been suffered to discontinue the vestments of his order, such was the state of the lower clergy that they would immediately have obeyed the signal and relinquished the surplice and the gown. Cranmer, upon consideration, determined to oppose Hooper's intentions, and in case of an obstinate adherence to his scruples, to remove him from his bishopric: a compromise eventually followed, and he adopted some of the usual habits.

The Bishop of Chichester would not obey the order respecting the removal of altars, and the primate consequently deprived him of his see. The case of Bishop Gardiner, who had now been in prison nearly two years, was also proceeded in. Articles were sent to him touching the king's supremacy—the full obedience owed to him notwithstanding his youth—that he had power to correct what was amiss in the church, &c.; and these, with some exceptions, he signed. Other articles were then framed, treating of the marriage of the clergy, the suppression of masses and images, the new book of service, &c.; to these he refused to put his name, upon which the commission, consisting of the primate, Bishop Ridley, who had succeeded Bonner in London, and six others, eventually deprived him of his bishopric and sent him back to the Tower. The conduct of Cranmer in the cases of Bonner and Gardiner was a great exception to his usual moderation. Gardiner, during his imprisonment, occupied himself in answering a treatise published by Cranmer, entitled the 'Defence of the True Doctrine of the Sacrament.' This controversy was carried on by the archbishop until the end of his life. The subject of it was one which had greatly occupied the mind of his friend, Bishop Ridley, as well as his own; he had more than once changed his opinions, which at length became fixed according to the doctrine maintained in his treatise. (Jenkyns's 'Remains of Cranmer.') His arguments with Gardiner and Smythe, his chief opponents, show considerable skill and learning.

At the close of this year a revision of the Service-book of 1548 was commenced by him, with the assistance chiefly of Ridley and Cox, who, with Peter Martyr and Bucer, stated objections and recommendations in writing. The undertaking was checked in 1551, by the death of Bucer, who (Burnet says) was, "by order of Cranmer and Sir John Cheek, buried with the highest solemnities that could be devised." The bishops being now (1551) for the most part divines favourable to the Reformation, the compilation of articles for the greater uniformity of faith was undertaken by them at the suggestion of the king. This additional labour so filled the hands of Cranmer, that his time was nearly always occupied by one or other of the great duties that he had imposed upon himself: scarcely could he be spared to attend at the trial of Bishop Tonstal, a man of moderation and learning, against whom accusations were brought forward in December. The bishop was deprived of his see, a sentence which was so contrary to Cranmer's wishes and opinion, that, together with Lord Stourton, a Roman Catholic, he entered his protest against it. It was not till this year (1552) that Cranmer gave up all hope of

effecting an agreement in religious doctrines among all the churches that had withdrawn from the Papal supremacy, and for the bringing about of which he had entered into an earnest correspondence with Calvin and Melancthon as well as other leading divines of the continental churches. He was greatly disappointed at the failure of a scheme in which he had always been sanguine of success. The reformers had now to lament the declining health of the king, but they did not relax their exertions in the cause of religion, for the Service-book was finally completed and the Book of Common Prayer adopted by parliament in the spring of 1552. A project for the reformation of the ecclesiastical courts was revived, and soon completed under the superintendence of the archbishop; only the king's signature was required for its validity. In May 1553, Edward issued a mandate that the clergy should subscribe to the Forty-two Articles upon which the divines had agreed; but he died soon afterwards without authorising the new ecclesiastical code, which it scarcely need be said was never adopted.

No sooner was Edward dead than Lady Jane Grey was proclaimed queen; and a letter was sent to the Princess Mary declaring Queen Jane to be the sovereign. This letter was signed by many of the principal persons in the state, and among others by Cranmer. His zeal for the Protestant cause must have blinded him to the danger of an enterprise directly contrary to the resolution he had formed upon first hearing of the project. On the 9th of July 1553, the chief officers of the state swore allegiance to Jane; on the 20th we find many of those who had been zealous in her cause, "impatient to send in their submissions to Mary." On the same day an order was sent by Mary to Northumberland to disarm, which paper, strange to say, was signed by Cranmer. The hopes of the Protestants were now at an end; Queen Mary's unshaken attachment to the Roman Catholic creed was universally known; Gardiner was released and made chancellor, and power of appointing preachers granted to him instead of to the primate: a commission was also given to the bishops of London, Winchester, Chichester, and Durham, to degrade and imprison Protestant prelates and ministers on the charges of treason, heresy, and matrimony.

Cranmer's friends recommended his immediate flight; but in consideration of the high office that he held, he rejected their advice. In the beginning of August he was summoned before the council, and ordered to confine himself to his palace; on the 27th he was again brought before the same tribunal; and in September, together with Latimer and Ridley, was committed to the Tower. During his confinement to the palace, in refutation of some reports that the primate would come over to the Roman Catholics, he wrote a declaration against the mass. This was not published, but by some means, respecting which there is a difference of opinion (Todd, vol. ii.; Burnet, vol. ii.), copies were obtained of it which reached the council, and were openly read in Chesapeake. In the Star-chamber Cranmer avowed the writing, and his intention of affixing it to every church-door in London. The council committed him not only for treason against the succession of the queen, but for perseverance in "disquieting the state." The queen did not oppose the committal.

In March 1554 Cranmer was removed, in company with his fellow-prisoners, Bishops Latimer and Ridley, to the prison of Bocardo at Oxford, where was renewed the controversy respecting the Lord's Supper, which, by the queen's desire, was named the subject for discussion.

On the 13th of April, the persons sent by the convocation to dispute appeared in the university, and Cranmer, who was first called before them, after examining the questions set before him (Burnet, vol. ii.), entered into argument upon them. After him reasoned Latimer and Ridley, amidst much shouting, bising, confusion, and insult. On the 19th the discussion was revived; and on the 28th they were again brought to St. Mary's, where it was declared, that unless they would turn, they were obstinate heretics, and no longer members of the church. Cranmer then replied, "From this your judgment and sentence I appeal to the just judgment of the Almighty, trusting to be present with Him in Heaven, for whose presence in the altar I am thus condemned;" and having thus spoken he was removed again to his prison.

He had some days before sent a petition to the council and the queen, praying pardon for his offences towards her, but the bearer to whom he had intrusted the papers broke them open, and it is not known that they reached their destination. However this may be, the council decreed that the charge of treason should be withdrawn, and the proceedings for heresy followed up, that the pains of fire, and not the axe, might be the manner of his death.

It was now discovered that the tribunal before which Cranmer had been tried was not competent to decide the case, and that the sentence was illegal. The pope therefore issued a fresh commission, and on the 12th of September 1555 the primate was again examined by Brokes, the bishop of Gloucester, and two civilians, Martin and Story. After some discussion, sixteen articles of accusation were produced, touching which eight witnesses were examined, and then the case closed. It is remarkable that, previous to these proceedings, Cranmer was summoned to appear within eighty days before the pope at Rome: this must have been a mere fiction of papal law, not intended for him to obey, as indeed it was impossible for any prisoner to do. Not long

after Cranmer was sent back to prison, he heard of the execution of Ridley and Latimer, and after a few more weeks had passed, he received from Cardinal Pole an answer to two letters that he had written to the queen during the interval between the last proceedings at Oxford and the day that these bishops were brought to the stake. It appears from these letters that the primate's adherence to Protestant principles was still unshaken. On the 29th of November the eighty days had elapsed, and on the 4th of December he was excommunicated and deprived of his bishopric. A letter from the pope (Paul IV.), bearing date the 14th of November, affirming him to be contumacious, because "he took no care to appear" at Rome when cited, and declaring him guilty of heresy and other enormities, finally commanded his execution. On the 14th of February, in obedience to this mandate, Cranmer was degraded. It was within a few days after this that the fortitude of a mind which had hitherto been firm gave way under the pressure of misery and the close prospect of a torturing death. The love of life overcame his firmness: he forsook his principles, and wrote a recantation of his faith. By whose exertions his resolution was shaken we cannot ascertain; but this unworthy sacrifice of opinion served only to render his enemies triumphant: whatever had been their promises, the recantation was of no avail towards the preservation of his life. On the 20th of March, the eve of his execution, he was visited by Dr. Cole, the provost of Eton College, who had been ordered by the queen to attend him. During this interview Cranmer gave answer that he remained firm in the Catholic faith as he had recently professed it, an answer that has by some been considered equivocal. After Cole had left him, Garcina entered the prison, and requested him to transcribe a recantation, to be delivered by him at the stake, which the prisoner consented to do. On the following day he was led to St. Mary's church, where, after an exhortation had been read by Dr. Cole, and Cranmer had finished his private devotions, he solemnly addressed the people, openly professing his faith, and at length declaring, "Now I come to the great thing that troubleth my conscience more than any other thing that I ever said or did in my life; and that is the setting abroad of writings contrary to the truth which I thought in my heart, and writ for fear of death, and to save my life, if it might be; and that is all such bills which I have written or signed with mine own hand since my degradation, wherein I have written many things untrue. And forasmuch as my hand offended in writing contrary to my heart, therefore my hand shall first be punished. For if I may come to the fire, it shall be first burned. And as for the pope, I refuse him as Christ's enemy, and antichrist, with all his false doctrine." The whole assembly was astonished at this speech; they had supposed that he would have confirmed and not retracted his recantation. He was then hurried away to the stake, where he stood motionless, holding up his right hand, and exclaiming, until his utterance was stifled, "This unworthy hand! Lord Jesus receive my spirit!"

Cranmer's diligence and application were unusual: he was deeply read in theology and canon law, and was familiar with Hebrew, Greek, and Latin, as well as French, German, and Italian, which he acquired during his travels; the copiousness of his common-place books gave weight to his opinion, and readiness to his power of argument. His reservation respecting the oaths which he swore when appointed archbishop, his subserviency to Henry VIII. in annulling his marriages, his share in the condemnation of some heretics, his conduct at the disgracing of Bonner and Gardiner, and the want of courage which made him recant after his condemnation, are great blot on his character. But though his conduct on these occasions was marked by dishonesty, intemperance, and want of firmness, these were rather impulses than habitual and characteristic vices, for it cannot be denied that Cranmer was sincere, mild, and moderate, and for the most part a firm man: nor is it to be forgotten that persecution was the policy of all religious parties at this period. He had moreover the virtue of constancy to his friends, a very rare quality in the times in which he lived; and never relaxed his friendship towards Anne Boleyn, Cromwell, or Somerset in their adversity. The affability of his manners, and the gentleness of his temper, made him beloved by many friends and men of learning, to whom he also extended a liberal hospitality; so that his protracted imprisonment and cruel death was one of the most unpopular measures of Mary's government. A complete collection of the extant works of Cranmer has been published at Oxford by Dr. Jenkyns, and the Parker Society has published various inedited writings under the title of 'Remains of Archbishop Cranmer.'

(*Strype, Memorials of Cranmer; Fox, Acts and Mon.; Burnet, Hist. Reform.; Gilpin, Todd, and Lo Bos, Lives of Cranmer;* and the general histories of the period.)

CRASHAW, RICHARD, an English poet, the son of the Rev. William Crashaw, a divine of some note in his day, was born in London, but in what year is uncertain. In early life he was placed, through the kindness of Sir Henry Yelverton and Sir Randolph Crew, upon the foundation at the Charterhouse, whence, in March 1632, he went to Pembroke-hall in Cambridge, and took the degree of B.A. in 1633. He afterwards went to Peterhouse, of which he was a fellow in 1637, and became M.A. in 1638.

In 1634 he published a volume of Latin poems, mostly devotional, in which the celebrated line is found upon the miracle at Cana in

Galilee, which has been ascribed to other and greater poets than Crashaw:—

"Nympha pudica Deum vidit, et erubuit."

"The modest water saw its God, and blushed."

A second edition of his Latin poems was published at Cambridge, 8vo, 1670.

At what time Crashaw was admitted into holy orders is uncertain. Wood says he took degrees at Oxford in 1641; about which time he seems to have become a popular preacher, full of energy and enthusiasm. His degrees however do not appear in the public register. In 1644, when the parliamentary army expelled those members of that university who refused to take the covenant, Crashaw was among the number; and being unable to contemplate with resignation or indifference the ruins of the church establishment, he went over to France, where his sufferings and their peculiar influence on his mind prepared him to embrace the Roman Catholic religion. In 1646 the poet Cowley found Crashaw in France in great distress, and introduced him to the patronage of Charles I.'s queen, who gave him letters of recommendation to Italy: there he became secretary to one of the cardinals at Rome, and was made a canon in the church of Loretto, where he died of a fever, soon after his promotion, about the year 1650. His 'Steps to the Temple, Sacred Poems, with other Delights of the Muses,' was published in 12mo, 1646; a second edition, 1648; and a third, also called second in the title, 8vo, 1670. Pope occasionally borrowed thoughts from Crashaw, but improved them. Crashaw resembled Herbert in his turn of mind, and possessed equal fancy and genius. In 1652 a posthumous volume of his poems was published at Paris, accompanied with vignettes by Massager, entitled 'Carmen Deo nostro, to decet Hymnus—Sacred Poems, collected, corrected, augmented, most humbly presented to my Lady the Countess of Denbigh, by her most devoted servant R.C., in hearty acknowledgement of his immortal obligation to her goodness and charity,' 8vo. An edition of his English Poems, selected from the two volumes, was published in 12mo, London, 1785.

CRASSUS, the surname of several Roman families, and especially of the triumvir Marcus Licinius. When he is first mentioned in history, he is spoken of as exceedingly rich; and it was partly owing to this circumstance that he was appointed to take the command against the revolted gladiators of Capua. In a few days he raised an army of six legions, and marched in quest of the enemy. A battle was fought in the south of Italy, near Rhegium, in which Crassus was completely victorious, and Spartacus fell with 40,000 of his men. Crassus was rewarded with an ovation on his return; but the victory having been achieved over slaves, instead of the usual myrtle-wreath, he had a laurel crown. (Aul. Gellius, v. 6) At the time of his expedition against Spartacus, he held the office of prætor; and the following year (A.U.C. 683, 71 B.C.), he was chosen consul with Pompey. The influence which Pompey gained by his popular and engaging manners succeeded in acquiring by the hospitality and munificence which his immense wealth easily supported. On one occasion he gave a general entertainment to the whole people, and distributed corn enough for three months' provision. No acts of importance however are recorded by historians during this administration. After some years, Crassus and Pompey dropped that determined violence towards each other, which, though frequently concealed, had never been wholly removed, and joined Cæsar in what is called the first triumvirate. While the actual power was almost entirely engrossed by Cæsar, he endeavoured to blind Crassus and Pompey to the real state of things by certain concessions which he made. With this view he included them both in a commission for dividing the lands of Campania, and for settling a colony at Capua, and thus enabled them to provide for some needy adherents to their interests. After a time the alliance was discontinued, but it was renewed again; and in B.C. 56 Pompey and Crassus offered themselves as candidates for the consulship, in order to keep out Domitius Ahenobarbus, who was violently opposed to Cæsar, and would be likely to thwart his designs. Cæsar had been appointed over the province of Gaul for five years; and Crassus and Pompey, though for some time they concealed their intentions, at last succeeded in gaining the provinces of Syria and Spain for the same period and on the same terms. Pompey did not leave immediately for Spain; but Crassus set out for Syria without delay, even before the year of his consulate had expired, B.C. 55. From the great preparations which he made, both in raising forces and in other ways, and from his known avarice, it was clear that a war with the Parthians was the real object at which he aimed; and the joy which he displayed at the prospect of so vast an increase of his wealth Appian (on the 'Parthian Wars,' s. 135) describes as perfectly childish and ridiculous. The tribune Ateius endeavoured to prevent Crassus from going on this expedition, but in vain; and as Crassus was passing through the gates of Rome, the tribune pronounced certain terrible imprecations upon him over a small fire, which had been lighted according to the usual practice in such cases. A person thus devoted, it was believed, could not possibly escape, and the person who so devoted another could not prosper himself, and therefore it was a course not pursued hastily or on light grounds. (Appian, s. 137; Cicero, 'De Divinatione,' i. 16.) This consideration increased the alarm which the curse produced in

the people, and even among the army of Crassus himself. Nevertheless he proceeded by way of Macedonia and the Hellespont, to Asia. He crossed the Euphrates and ravaged Mesopotamia without resistance. Orodes (Arsaces XIV.), the king of Parthia, being at the time engaged in an invasion of Armenia, his general Surena commanded the Parthian forces against the Romans. A battle was fought near Carrhæ between Crassus and Surena, in which Crassus was defeated. The clamours of his soldiers obliged him to accept proposals of peace from Surena, to whom the messengers of the Parthian general promised to lead him. His resistance to their insulting treatment provoked their fury, and they put him to death without delay, B.C. 53. Surena had his head and right hand cut off and sent to Orodes, and the Parthian monarch is said to have caused melted gold to be poured into the mouth of the Roman general, exclaiming, "Take your fill now of the gold which during life you so coveted." (Dion Cassius, xl. 27.) The Romans are said to have had in this unfortunate campaign 30,000 men killed and taken prisoners.

We have no proof that Crassus possessed talent of any kind, and, but for his wealth, he would probably have been scarcely known. From his father he inherited a large fortune, but the rest of his wealth was not acquired by the most honourable means. He is said to have enriched himself by purchasing at a very low price the estates of those who were proscribed by Sylla; also by letting for hire slaves whom he had instructed in various arts and trades; and so high was his own standard of opulence, that he said no one could be rich who was not able to maintain an army at his own expense. With all his avarice he was generally ready to lend money to his friends, and was hospitable without extravagance. Cicero ('Brut,' sect. 66) represents him as a man of moderate acquirements and slender abilities, but of great industry and perseverance. In another of his works ('Tusc. Quæst,' v. 40) he says, "Crassus was somewhat deaf, but a greater misfortune than this was the bad character which people gave him, though in my opinion unjustly."

(Cicero, *Epist. ad Atticum*, i. 14, 17; iv. 13; Appian, *on the Parthian Wars*, ss. 134-155; Dion Cassius, xxxvi., xxxvii.; Plutarch, *Life of Crassus*.)

Coin of CRASSUS.

British Museum. Actual size. Silver. Weight 61½ grains.

CRASSUS, LUCIUS LICINIUS, was considered the greatest orator of his time. He appears to have superintended the course of Cicero's early education. ('De Oratore,' ii. 1.) Cicero in one place ('Brut,' s. 38) pronounces him perfect; and in the treatise before referred to ('De Oratore') he delivers his own sentiments on eloquence in the person of Crassus. In the beginning of the third book he takes occasion to lament the death of the interlocutors in the dialogue, Crassus and Antonius.

CRATERUS. [ALEXANDER III.]

CRATES, the name of several Greek writers. 1, A comedian of Athens, one of the most eminent of the predecessors of Aristophanes, who speaks very favourably of him. ('Eqq.' 537.) He is said to have been originally one of Cratinus' actors (Schol. on Aristoph. 'Eqq.'), but he could not have been so very long, since he was well known as a comic writer in B.C. 450. (Euseb. 'Ad Olymp,' 82, 2.) Aristotle tells us that he was the first who introduced regular plots into his comedies. ('Poet.' c. v.) 2, A Cynic philosopher, the son of Ascondas of Thebes, who flourished about the year B.C. 328. He was living in B.C. 307, when Dometrius Phalereus retired to Thebes. (Diogen. Laërt. vi. 85; Plutarch, 'Mor.,' p. 69, a.) He was a disciple of Diogenes and Bryson, and was surnamed the 'door-opener' (*hyperocheutes*), from his habit of entering any house he pleased whether invited or not. (Suidas.) 3, A philosopher of the old academy, son of Antigene, and born in the deme of Thria in Attica. He was a disciple of Polemo, to whom he was much attached, and the instructor of Arceilaus and Bion the Borysthenite. (Diog. Laërt. iv. 4.) He flourished about the year B.C. 287. (Clinton, 'Fasti Hellenici,' ii., p. 183.) Cicero says that his philosophical doctrines did not at all differ from those of Plato. ('Academ.' i. 9.) 4, A celebrated grammarian and stoic, son of Timocrates, and born at Mallos in Cilicia. He was sent as ambassador to Rome by Attalus, king of Pergamus, about the year B.C. 159. (Clinton, 'Fasti Hellenici,' iii., p. 89.) His works were very numerous. (See a list of them in Clinton, iii., p. 528, note c.)

CRATINUS, the son of Callimedes, a writer of the old comedy, was born at Athens B.C. 519. It is not known when he began to write comedies; it is inferred however from the words of Aristophanes ('Eqq.' 524-530), that he did not appear as a dramatist till somewhat advanced in life. (Clinton, 'Fasti Hellenici,' vol. ii., p. 49.) He was the most formidable adversary of Aristophanes: two occasions are

recorded on which the judges pronounced him only second to that great poet; and in a.c. 423, the first prize was awarded to his comedy called the 'Wine-Flask,' the 'Connus' of Ameipsias being placed second, and the 'Clouds' of Aristophanes third. He died the year after. Cratinus was highly esteemed by his countrymen, and at one time, according to his rival Aristophanes, was so much in fashion, that no songs were listened to at banquets except choruses from his comedies. In his old age he was much addicted to drinking; and in his last play he shows how his faithful wife 'Comedy' strove to get divorced from him in consequence of his exceeding love for his fascinating mistress the 'Wine-Flask.' (Scholiast on Aristoph. 'Eqq.' 401.) Aristophanes frequently alludes to this failing of his contemporary. (For instance, the 'Peace,' 701.) The names of forty of his comedies have come down to us. (Fabricius, 'Bibl. Græca,' li, p. 431.)

CRATIPPUS, a Peripatetic philosopher, born at Mitylene. He was a contemporary and friend of Cicero, who thought him the first philosopher of the age ('De Officiis,' "a Cratippo nostro, principe hujus memoris philosophorum"), and intrusted his son Marcus to his care at Athens. ('De Officiis,' i. 1.) He taught first in his native place, where he was still residing when Pompey came thither after the battle of Pharsalia; he had an interview with the defeated general, with whom he conversed on providence. (Plutarch, 'Pomp.' c. lxxv.) Afterwards he went to Athens, and Cicero not only got him made a Roman citizen by Julius Cæsar, but even prevailed upon the Areopagus to vote that he should be requested to continue at Athens as an instructor of youth, since he was an ornament to the city. (Plutarch, 'Cicero,' c. xxiv.) Brutus went to Athens to hear Cratippus while engaged in preparations to meet the army of the Triumvirate. (Plutarch, 'Brutus,' c. xxiv.) Cratippus wrote a treatise on divination, in which he allowed that kind which was derived from dreams and the ravings of idiots, but denied all other sorts of divination. (Cicero 'De Divinat.,' i. 3 and 32.) In addition to his merits as a philosopher, we are told that he was an amusing companion, and gifted with great powers of conversation. (Cicero, 'Ad Familiares,' xvi. 21.)

CRAYER, CASPAR DE, one of the most distinguished Flemish historical painters, was born at Antwerp in 1582, and was instructed by Raffaele, the son of Michael Coxie. He first distinguished himself at Brussels, where he painted several great altar-pieces, but he settled eventually at Ghent, where his greatest works are still preserved in the museum and in various churches: many of his works however are scattered over Germany and the Netherlands. He died at Ghent in 1669.

The works of Crayer, in their style, subjects, and dimensions, are generally of the highest pretensions, and they are in a great degree successful, but yet are frequently formal and cold. Besides other great works, he painted at Ghent twenty-one large altar-pieces for the principal churches of that city, some of which, for their fulness and dignity of subject, correct and occasionally vigorous design, and the judicious bestowal of extra care in the execution of their more important parts, command high admiration, notwithstanding a very sensible coldness of effect and a certain formality of treatment. Even the gorgeous taste of Rubens is said to have been vividly impressed with the great merits of Crayer.

There are fourteen of his works in the museum of Ghent, comprising some of his principal pictures, as—'St. Rosalia crowned by the infant Christ;' the 'Martyrdom of St. Blaise,' his last work, painted in his eighty-sixth year; and three of the pictures painted for the triumphal arches erected at Ghent upon the occasion of the formal entry of Prince Ferdinand, Infant of Spain, into Ghent, in 1625. One is Francis I. surrendering his sword to Lannoy after the battle of Pavia in 1525; another, the descent of Charles V. upon the coast of Africa in his expedition against Tunis, ten years afterwards: the figures of these works are colossal, and they are alight in their execution, but at the same time remarkably vigorous and correct. There are a few works by Crayer in Spain, and he is supposed to have visited that country in the reign of Philip IV. Few of his great works have been engraved, and they have comparatively seldom been moved, being too large for the commerce of picture-dealers. The large altar-piece of the 'Virgin and Child enthroned amongst angels and surrounded by saints,' in the gallery of Munich, about 19 feet long by 12 feet wide, and by no means one of the best of his works, cost, with the copy that was substituted in its place, 20,000 rix dollars. Sir Joshua Reynolds, who saw this picture in the gallery at Düsseldorf, makes some severe but just observations upon it in his 'Journey to Flanders and Holland.' It was painted in 1616, and the lower figures are portraits of Crayer and his family.

(Descamps, *La Vie des Peintres Flamands*, &c.)

CREBILLON, PROSPER JOLYOT DE, was born at Dijon in 1674, of an ancient and noble family. He was sent by his father to Paris to study the law, under a person named Prieur. The master and pupil were both attached to the theatre; and the former observing in Crebillon strong marks of a poetic genius, urged him to try his powers on a tragedy. Crebillon accordingly took the subject of the Children of Brutus, which he carried to the actors, who however rejected it in a manner so little flattering to the feelings of an author that he threw his manuscript into the fire, and gave up all thoughts of writing for the stage. Prieur would not suffer him to remain in

this despondency, and the tragedy of 'Idoménée,' produced in 1707, was the fruit of his persuasions. The fifth act did not at first please the audience, but an alteration was made, and the piece was perfectly successful. In 1707 appeared his second piece, called 'Atrée,' which is founded on the horrible incident of Atreus bringing to Thyestes a cup filled with the blood of his own son. Prieur being in a declining state of health when this tragedy came out, was carried into a box: at the end of the representation he embraced Crebillon, and said, "I die contented; I have made you a poet, and I leave a man to the nation." The success of 'Atrée' was indeed very fair, but it was not until the production of 'Rhadamiste,' in 1711, that Crebillon's fame rose to its height, and it is on this piece that it chiefly rests. After the production of this piece, Crebillon did not much increase his reputation; his 'Xerxes' (1714) and 'Semiramis' (1717) were not very successful; and though 'Pyrrhus' (1726) was very well received, the author himself said he was surprised, as it was "the shadow of a tragedy, rather than a tragedy itself."

He did not bring out any other piece for twenty-two years. The death of his wife, and certain pecuniary difficulties, weighed down his spirits to such an extent that he was incapable of writing. However, at the end of that period he was allowed by the king a pension of 1000 francs, for which he was indebted to the persuasions of Madame Pompadour, who was instigated, it is said, by her hatred to Voltaire to benefit Crebillon, as these two authors were looked on as rivals in the drama. His tragedy of 'Catilina' was now advertised, and great were the expectations of the public; the court were determined to patronise him, and the king himself furnished the requisite dresses. It was produced in 1749, and the applause was tumultuous. The public however on reading it began to retract their hasty praise, and it was objected that the tragedy was a very unfaithful picture of the manners of ancient Rome, a censure which should not be passed on Crebillon as peculiarly distinguishing him from other authors of his school. 'Le Triumvirat' was produced when the author was eighty-one years of age and had but indifferent success; he also began another tragedy, called 'Cromwell,' about this time, which was never completed.

Crebillon died in 1762, and a monument was erected to his memory in the church of St. Gerrois, by the order of Louis XV. The French actors also caused a magnificent service to be celebrated in the church of St. Jean de Latran in honour of the veteran dramatist, at which all the literati and most of the nobility of France attended.

Those who wish to know more of Crebillon may read a chapter on this author in La Harpe's 'Cours de la Littérature.' The chapter is a long one, and the extracts are so copious, and the reader's attention is directed so pointedly to the remarkable passages that he may really learn more of Crebillon by reading that critique than by perusing the author's own works.

CREBILLON, CLAUDE PROSPER JOLYOT DE, son of the preceding, was born at Paris in 1707. He wrote a number of romances, which acquired a great popularity, owing, as some say, more to their extreme licentiousness than to any intrinsic merit. His strict moral character is always brought forward as a remarkable contrast to the great laxity of his writings. He was well known as a member of two convivial societies, called the Dominicaux and the Caveau, the latter of which enrolled among its names those of Piron, Collé, and Gallet. Crebillon the younger died in 1777.

The remark that his fame is only owing to his obscenity does not to us seem wholly true. The fact is that his novels, in spite of their outrageous indecency, contain a remarkably accurate picture of the motives that actuate persons in a corrupt state of society. Still, the philosophy which they inculcate is of a morbid nature (being much like that of Rochefoucault), and only those whose minds are unassailable by impurity can peruse with any profit the novels of Crebillon.

CREDI, LORENZO DI, one of the best of the old Florentine painters and sculptors, was born at Florence about 1453. His real name was, according to Vasari, Lorenzo Sciarpelloni, and he acquired the name of Credi from his master, a distinguished goldsmith at Florence in that time. Lorenzo however did not remain long with Credi; his skill in drawing warranted his exchanging the art of the goldsmith for that of the painter, though he had distinguished himself as a goldsmith, and he accordingly entered the school of Verrocchio, in which he was the fellow-pupil of P. Perugino and of Leonardo da Vinci, the latter of whom he afterwards imitated.

Lorenzo was Verrocchio's favourite pupil; and when Verrocchio went to Venice to make the bronze equestrian statue of Bartolomeo Colleoni [VERROCCIO, ANDREA DEL], he left Lorenzo in charge of all his affairs at Florence. Lorenzo visited his master several times while he was engaged at Venice, and after his unexpected death in 1488 carried his body home to Florence. Verrocchio made Lorenzo di Credi his principal heir, and expressed a desire in his will that he might be entrusted with the completion of the monument of Colleoni. Credi did not take possession of any of Verrocchio's property, except his drawings and works of art; the rest he made over to his relations.

Lorenzo di Credi was an excellent painter. His 'Birth of Christ,' formerly in the monastery of Santa Chiara, but now in the gallery of the Academy at Florence, is one of the best works in that admirable collection; it is excellent in expression, in colouring, and in the exe-

cution both of the principal and the accessory parts. His best work however, in the opinion of Vasari, is the picture of the 'Madonna and Child,' with Saints Julian and Nicolas, painted for a chapel of the convent of Castello, but at present in the Louvre at Paris, No. 958, and in excellent preservation. Vasari mentions many of Lorenzo's works, several of which are now lost, but there are still a few 'Holy Families' by him in Florence and other parts of Italy. Credi, when old, having become wealthy by his labour, retired into Santa Maria Nuova at Florence, and died there, according to Vasari, in 1580, aged seventy-eight; but the date Gaye has shown to be incorrect, whatever the age may be, for he was still living in 1536, but ill and bed-ridden. Gianantonio Sogliani, who lived with Credi twenty-four years, was his most distinguished scholar.

(Vasari, *Vite de' Pittori, &c.*; Gaye, *Carteggio d'Artisti*.)

CREECH, THOMAS, is the translator of Lucretius, Horace, Theocritus, and detached portions of several other Greek and Latin authors, of which a list is given in Kippis's 'Biographia Britannica.' He was born at Blandford in Dorsetshire in 1659, admitted of Wadham College, Oxford (of which he appears from the title-page of his Lucretius to have become a Fellow), in 1675, and elected probationer-fellow of All Souls in November 1683. He published in 1682 his translation of Lucretius, which appears to have gained much credit at Oxford, and is his best work. Dryden, who himself translated parts of Lucretius, has bestowed high praise on his predecessor. ('Preface to first part of Miscellanies.') Creech published a Latin edition of the same author in 1695, and a translation of Horace in 1684, the latter with very indifferent success. He was appointed to the college living of Woburn, Herts, in 1699; and two years afterwards, in June 1701, hung himself in his chamber at Oxford. His temper was very morose, which leaves room to ascribe this act to some constitutional infirmity.

CRESPI, GIUSEPPE MARIA (CAVALIERE), a painter and engraver of Bologna, distinguished in his time, was born at Bologna in 1665. He was the scholar of Canuti and of Cignani, and was called *Lo Spagnuolo* on account of his gay attire. He was also remarkable for his perseverance in copying the works of the Caracci, Correggio, and Barroccio, and some of his copies are said to have been sold at Bologna as originals. He studied later the effect of Guercino and the composition of Pietro da Cortona. He became eventually one of the most careless and capricious of painters, though all his works exhibit great skill, and he had a surprising facility of execution; indeed he is in this respect probably unequalled. Mengs terms him the destroyer of the Bolognese school, his great facility and equal success having seduced the painters of his time to adopt similar carelessness of manner. There are twelve of his works in the gallery of Dresden, including the 'Seven Sacraments,' painted for Cardinal Ottoboni, and an 'Ecce Homo,' which with all its faults is a masterly performance. In colour it is rather green, but in drawing and in character it is excellent, and in boldness and decision of touch surprising; it appears to have been painted in one heat, and that a short one, though it contains three half-length figures of the size of life—Christ and two soldiers. Crespi died in 1747.

His two sons, Luigi and Antonio, followed their father's profession, but not his style. Luigi Crespi, or Don Luigi Canonico, as he was designated, is well known for his writings on art, and especially for his continuation of the 'Felsina Pittrice,' or 'Bologna Paintress,' of Count Malvasia. The count's work is in two volumes, and Crespi published a third, with the same title, in 1769. In it he has written a life of his father, and an apology for his faults. He died in 1779.

(*Guida di Bologna*; Lanzi, *Storia Pittorica, &c.*; Bartsch, *Peintre-Graveur*.)

* CRESWICK, THOMAS, R.A., was born in 1811 at Sheffield, in Yorkshire, and educated at Hazelwood, near Birmingham, where his fondness for drawing became very conspicuous. He removed to London, with a view to prosecute his artistic studies, in 1828. The same year two of his landscapes appeared in the exhibition of the Royal Academy; and from that time to the present he has been one of the most regular contributors to the exhibition, besides for many years contributing regularly to the annual exhibition of the British Institution.

Mr. Creswick is one of the most general favourites among living English landscape-painters. His subjects are almost invariably suggestive of pleasing associations, so that their very titles contribute to their popularity; and they are always thoroughly national. Though often faithful transcripts of particular spots, they seldom receive in the exhibition catalogues "a local habitation," their name being for the most part some pleasant poetic one, or else typical of a class, or pointing to some peculiarity of weather or season of the year. Thus, among his best-known pictures we have in the river class 'A Cool Spot,' 'A Shady Glen,' 'A Rocky Stream,' 'A Greenwood Stream,' 'A Mountain Stream,' and 'Windings of a River;' among the woodlands 'A Glade in the Forest,' 'The Chequered Shade,' 'The Shade of the Beech Trees;' when he depicts atmospheric appearances we have such titles as 'Rain on the Hills,' 'Passing Showers,' 'Doubtful Weather,' 'Passing Clouds,' 'Summer-Time,' 'Early Spring,' and the like.

Among the first pictures by which Mr. Creswick made himself known were his Welsh streams, and, to our thinking, the exquisite combinations of rocks and light foliage with clear swift running water and

glimpses of the neighbouring mountains seen in almost matchless perfection in North Wales, were never so charmingly expressed as in Creswick's pictures. The rivers of his native Yorkshire were however not less happily rendered by him. His 'Course of the Greta through Bernal Woods,' exhibited in 1842, and some of those admirable scenes known to have been painted from the Wharfe above Bolton Abbey, are certainly among his choicest works. The scenery of Wales, Yorkshire, and Cornwall may be said, whatever were the specific titles of his pictures, to have furnished the subjects of his paintings till his Irish tour supplied a new and wider range: his 'Glandalough' and one or two more seemed then to imply that he was about to grapple with a bolder and sterner class of subjects, but he soon returned to his old favourites, carrying with him however a somewhat more sombre tone of colour.

In 1842 Mr. Creswick was elected an Associate of the Royal Academy, and his merits having received that mark of professional recognition, he seemed to work with more freedom and decision. He began to venture on larger canvasses and treat of more ambitious themes. But his powers may perhaps be regarded as having reached their maturity in 1847, when he exhibited two of his greatest works 'England,' and the 'London Road a hundred years ago:' both displaying in conception and execution many of the best attributes of the landscape art; in the 'Weald of Kent,' and one or two more, he has successfully repeated the same extensive prospects on a scale of nearly equal magnitude. The next year, 1848, Mr. Creswick surprised the public by a bold departure from his usual style in two sea-side views, 'Home by the Sands,' and a 'Squally Day,' painted somewhat in the manner of Collins, but with sufficient originality to prevent any charge of imitation, and with so much truth and beauty as to command general admiration. In 1850 Mr. Creswick painted in the same style, 'Wind on Shore,' and 'Over the Sands,' but he appears to have since abandoned his sea-side studies. Another branch of the landscape art in which he has been very successful is that of which the 'Forest Farm,' the 'Valley Mill,' and the views of the terrace at Haddon may be taken as the type. Like many other landscape painters Mr. Creswick cannot be regarded as happy in his figures, yet the pictures he has painted in conjunction with Mr. Ansell, in which the latter has supplied some capably painted groups of animals, are not among his most desirable productions. He works best alone.

Much of the freshness and faithfulness of Mr. Creswick's pictures are due to his practice of painting them in the open air, and direct from the object or from nature—a practice now common enough, but which among oil-painters he was one of the first to adopt as a regular habit. But every picture he has painted bears testimony to this direct study of nature, and to his own thorough enjoyment of his occupation. Neither in composition nor colour has he worked by rule: and if, as is sometimes the case in his later pictures, we desiderate a little more richness and variety in the colour, we feel that the painter so thoroughly comprehends the particular idea he wishes to embody, that we distrust our own impression, and readily accept his reading of the text.

Mr. Creswick has made numerous designs for various publications, and has for some time been engaged in preparing a series of views of Welsh scenery for lithographing on a large scale; he has also executed several etchings. He was elected R.A. in 1851.

CRÉVIER, JEAN BAPTISTE, born at Paris in 1693, was the son of a journeyman printer. He studied under Rollin, and afterwards became professor of rhetoric in the college of Beauvais. After Rollin's death he undertook to continue his 'Roman History,' of which he wrote eight volumes. He is less diffuse and digressive than his master, though not so pleasing in his style of composition. He also published an edition of Livy in 6 vols. 4to, 1748, with notes. The work by which he is best known is 'Histoire des Empereurs Romains jusqu'à Constantin,' 6 vols. 4to, Paris, 1756. The author has scrupulously adhered to the ancient authorities in the statement of facts, but his narrative is deficient in interest and force. Crévier wrote also 'Histoire de l'Université de Paris,' 7 vols. 12mo, 1761, which is in great measure an abridgment of the larger work of Egasse du Boulay; and 'Rhétorique Française,' 1765, a good work, which has been frequently reprinted. Crévier died at Paris in December 1765.

CRICHTON, JAMES, commonly called the 'Admirable,' son of Robert Crichton of Elioek, who was lord-advocate to king James VI., was born in Scotland in the year 1561. The precise place of his birth is not mentioned, but he received the best part of his education at St. Andrews, at that time the most celebrated seminary in Scotland, where the illustrious Buchanan was one of his masters. At the early age of fourteen he took his degree of Master of Arts, and was considered a prodigy not only in abilities but in actual attainments. It was the custom of the time for Scotchmen of birth to finish their education abroad, and serve in some foreign army previously to entering that of their own country. When he was only sixteen or seventeen years old, Crichton's father sent him to the continent. He had scarcely arrived in Paris, which, whatever may have been its learning, was then a gay and splendid city, famous for jousting, fencing, and dancing, when he publicly challenged all scholars and philosophers to a disputation at the College of Navarre, to be carried on in any one of twelve specified languages, "in any science, liberal art, discipline, or faculty, whether practical or theoretic;" and, as if to show in how little need he stood

of preparation, or how lightly he held his adversaries, he spent the six weeks that elapsed between the challenge and the contest in a continual round of tilting, hunting, and dancing. On the appointed day however he is said to have encountered all "the gravest philosophers and divines," to have acquitted himself to the astonishment of all who heard him, and to have received the public praises of the president and four of the most eminent professors. The very next day he appeared at a tilting match in the Louvre, and carried off the ring from all his accomplished and experienced competitors. Enthusiasm was now at its height, particularly among the ladies of the court; and from the versatility of his talents, his youth, the gracefulness of his manners, and the beauty of his person, he was named 'L'Admirable.' After serving two years in the army of Henri III., who was engaged in a civil war with his Huguenot or Protestant subjects, Crichton repaired to Italy, and repeated at Rome, in the presence of the pope and cardinal, the literary challenge and triumph that had gained him so much honour in Paris. From Rome he went to Venice, at which gay city he arrived in a depressed state of spirits. None of his Scottish biographers are very willing to acknowledge the fact, but it appears quite certain that, spite of his noble birth and connections, he was miserably poor, and became for some time dependent on the bounty and patronage of a Venetian printer—the celebrated Aldus Manutius. After a residence of four months at Venice, where his learning, engaging manners, and various accomplishments excited universal wonder, as is made evident by several Italian writers who were living at the time, and whose lives of him were published, Crichton went to the neighbouring city of Padua, in the learned university of which he reaped fresh honours by Latin poetry, scholastic disputation, an exposition of the errors of Aristotle and his commentators, and (as a playful wind-up of the day's labour) a declamation upon the happiness of ignorance. Another day was fixed for a public disputation in the palace of the Bishop of Padua, but this being prevented from taking place, gave some incredulous or envious men the opportunity of asserting that Crichton was a literary impostor, whose acquirements were totally superficial. His reply was a public challenge—the contest, which included the Aristotelian and Platonic philosophies, and the mathematics of the time, was prolonged during three days, before an innumerable concourse of people. His friend Aldus Manutius, who was present at what he calls "this miraculous encounter," says he proved completely victorious, and that he was honoured by such a rapture of applause as was never before heard.

Crichton's journeying from university to university to stick up challenges on church doors and college pillars, though it is said to have been in accordance with customs not then obsolete, certainly attracted some ridicule among the Italians; for Boccacini, after quoting one of his placards, in which he announces his arrival and his readiness to dispute extemporaneously on all subjects, says that a wit wrote under it, "and whosoever wishes to see him, let him go to the Falcon Inn, where he will be shown," which is the formula used by showmen for the exhibition of a wild beast, or any other monster. ('Ragguagli di Parnaso.')

We next hear of Crichton at Mantua, and as the hero of a combat more tragical than those carried on by the tongue or pen. A certain Italian gentleman, "of a mighty, able, nimble, and vigorous body, but by nature fierce, cruel, warlike, and audacious, and superlatively expert and dexterous in the use of his weapon," was in the habit of going from one city to another to challenge men to fight with cold steel, just as Crichton did to challenge them to scholastic combats. This itinerant gladiator, who had marked his way through Italy with blood, had just arrived in Mantua, and killed three young men, the best swordsmen of that city. By universal consent the Italians were the ablest masters of fence in Europe—a reputation to which they seem still entitled. To encounter a victor among such masters was a stretch of courage, but Crichton, who had studied the sword from his youth, and who had probably improved himself in the use of the rapier in Italy, did not hesitate to challenge the redoubtable bravo. They fought: the young Scotchman was victorious and the Italian left dead on the spot.

Soon after this the sovereign Duke of Mantua engaged Crichton as companion or preceptor to his son Vincenzo Gonzaga, a young man who, according to Muratori, had shown a strong inclination for literature, but who was otherwise of a passionate temper and dissolute manners. ('Annali d'Italia.')

At the court of Mantua, Crichton added to his reputation by writing Italian comedies, and playing the principal parts in them himself. His popularity was immense, but of brief duration. He was cut off in his twenty-third year, without leaving any proofs of his genius except a few Latin verses, printed by Aldus Manutius, and the testimonials of undoubted and extreme admiration of several distinguished Italian authors, who were his contemporaries and associates. As he was returning one night from the house of his mistress, and playing and singing as he walked (for he was an accomplished musician), he was attacked by several armed men in masks. One of these he disarmed and seized; the rest took to flight. Upon unmasking his captive he discovered the features of the Prince of Mantua. He instantly dropped upon one knee, and presented his sword to his master, who, inflamed by revenge, and, it is supposed, by jealousy, took the weapon and ran him through the body. Some contemporary accounts attribute his death to an acci-

dental midnight brawl, others to a premeditated plan of assassination, but all seem to agree that he fell by the hand of the prince; and a belief, or a popular superstition, prevailed in Italy, that the calamities which befel the house of Gonzaga shortly after were judgments of the Almighty for that foul murder.

Such appear to be the well-authenticated points of a wonderful story, that has often been doubted, not only in parts, but almost altogether. It has however been cleared up of late years by the industry and research of Mr. Patrick Fraser Tytler, who produces a mass of contemporary or nearly contemporary evidence.

(*Life of James Crichton of Cluny, commonly called the Admirable Crichton; with an Appendix of Original Papers*, 1 vol. 8vo, Edinb., 1819.)

CRESUS, the last of the Mermnades, son of Alyattes, succeeded his father Alyattes as king of Lydia at the age of thirty-five, *b.c.* 560. (Herod., i. 7 and 26.) But before this time he seems to have been associated with his father in the government. (Clinton, 'Fast. Hel.' p. 297; and Larcher, 'On Herod.', i. 27.) He was contemporary with Pisistratus, tyrant of Athens (Herod., i. 59), and with Anaxandrides, king of Sparta (i. 67). He attacked and reduced to subjection all the Ionians and Æolians in Asia (i. 26), and all the nations west of the Halys (i. 28). The increase of the Persian power led him, after consulting various oracles in Europe, Asia, and Africa, to form an alliance with Amasis, king of Egypt (i. 77), and with the Lacedæmonians (i. 69), as the most powerful people of Hellas, about *b.c.* 554. (Clinton, 'Fast. Hel.' p. 207.) He subsequently attacked and conquered the Cappadocian Syrians beyond the Halys, and engaged in battle with Cyrus, in which however neither was victorious. He returned to Sardis, intending to wait till the following year to renew the war; but Cyrus, anticipating his designs, attacked him in his own capital, defeated him, and took Sardis, *b.c.* 546. Croesus was made prisoner and was placed on a pile to be burnt, but Cyrus relented, and the fire was extinguished. He reigned fourteen years. After his captivity he became Cyrus's favourite companion and adviser in his future wars. When Cyrus died he recommended Croesus to his son and successor, Cambyses, as one in whom he might confide as a friend. Croesus however did not long continue in the favour of Cambyses; he took upon himself on one occasion to admonish the king, believing him to be insane, and he had great difficulty in escaping with his life. Little is known of him after this period. While king he was visited by Solon, and Herodotus (i. 30-38) records a long conversation between them on wealth and happiness. The riches of Croesus were so great that his name had almost passed into a proverb. It is said that he had a son who was born deaf and dumb, but who gained the faculty of speech by the effort which he made to cry out when he saw a Persian going to kill his father at the capture of Sardis. (Herodotus; Plutarch, *Life of Solon*.)

CROFT, WILLIAM (Mus. Doc.), who as a composer of cathedral music has no superior, was born in Warwickshire in 1677, and educated in the Chapel-Royal under Dr. Blow. His earliest preferment was to the place of organist of St. Anne's, Soho, when an organ was for the first time erected in that church. In 1700 he was admitted a gentleman-extraordinary of the Chapel-Royal; and in 1704 was appointed joint-organist of the same with Jeremiah Clark, on whose decease, in 1707, he obtained the whole place. In 1708 he succeeded Dr. Blow as Master of the Children and Composer to the Chapel-Royal, and also as organist of Westminster Abbey. In 1711 he published, but without his name, a volume containing the words of the anthems used by the three London choirs, with a preface, giving a brief history of English church-music. In 1715 Croft was created Doctor in Music by the University of Oxford; his exercise consisted of a Latin and an English Ode, both of which were afterwards curiously engraved in score, and published under the title of 'Musici Apparatus Academicus.' In 1724 he published his noble work, 'Musica Sacra,' in two volumes, folio. He states in the preface that his work is the first essay in music-printing of the kind, it being in score, engraved, and stamped on plates, and that for want of some such contrivance, the music formerly printed in England was very incorrectly published; as an instance of which he mentions Purcell's 'Te Deum' and 'Jubilate.' Dr. Croft died in 1727, of an illness produced by his attendance at the coronation of George II., and was interred in Westminster Abbey, where a monument, erected to his memory by his friend Humphrey Wyley Birch, Esq., records his high merits as a composer, and his amiable and excellent moral qualities as a member of society. As a composer of ecclesiastical music Dr. Croft has no superior. Besides his ecclesiastical music, Dr. Croft was the author of six sonatas for two flutes, six for a flute and a bass, and numerous songs, which appeared in the various musical publications of his day. (Hawkins and Burney, *Histories of Music*.)

* CROKER, THE RIGHT HONOURABLE JOHN WILSON, represents a branch of an ancient family which was settled for many generations at Lineham, in South Devon. A member of this family emigrated to Ireland about the year 1600, and his sons distinguished themselves at the capture of Waterford in 1650. Various descendants of this branch received grants of land in the south of Ireland, which they increased from time to time by marriages with influential families. Mr. Croker, the father of the subject of our present memoir, was for many years surveyor-general of Ireland, and in that position

became extremely popular. By his marriage with Hester, daughter of the Rev. R. Rathborne, he had an only son, John Wilson, who was born in Galway, December 20, 1780.

After receiving his early education at a school in Cork, where he displayed great precocity and an inquisitive disposition, he was entered at Trinity College, Dublin, at the age of sixteen, under the late Dr. Lloyd. He soon began to show extraordinary readiness and ability by the part which he took in the 'Historical Debating Society,' since suppressed, but which then was in active operation, drawing out and developing the characters of young men, and preparing them for their appearance afterwards on the stage of public life. So highly did the society esteem the share taken in its proceedings by Mr. Croker, that it voted him its first gold medal. Intended by his parents for the study of the law, Mr. Croker had no sooner taken his B.A. degree in 1800, than he was entered as a student at Lincoln's Inn; but he continued to reside in Dublin, and to mix with the society of that capital: he was called to the Irish bar in 1802. He had leisure hours on his hands, and these he devoted to literature. His first production as an author, if we except a short paper of mere ephemeral interest, was a series of 'Familiar Epistles to J. F. Jones, Esq., on the present state of the Irish Stage,' which was published in 1803, and was followed in 1805 by his 'Intercepted Letter from China,' both anonymous. Both were clever and caustic satires, excited much curiosity and attention, and ran speedily through several editions.

In 1807 he published a work of a graver kind on 'The State of Ireland Past and Present,' in evident imitation of the treatise of Tacitus 'De Moribus Germanorum;' in this pamphlet he strongly advocated Catholic emancipation. At the close of the preceding year Mr. Croker was employed as counsel for Sir J. Rowley at the election for Downpatrick. Sir Josias withdrew just before the election, and Mr. Croker was nominated in his place, but was defeated by a small majority. In the following May however he was returned for the borough, and confirmed in his seat on petition.

He had not been long in parliament when an opportunity offered for the display of his oratorical powers. Early in 1809 the Duke of York was brought practically upon his trial before the country for corrupt administration at the Horse Guards, and the best and most successful speech made in defence of his royal highness against Colonel Wardle's motion of censure, was delivered by Mr. Croker on the 14th of March. This speech contained a minute dissection of the evidence brought forward against the duke, and was couched in vigorous and pointed language. It may be presumed that the grateful sense which his royal highness thenceforth entertained for this support hastened the advance of Mr. Croker to office. In the course of the same session the late Duke of Wellington, then Sir Arthur Wellesley, and chief secretary for Ireland, being obliged to repair to Dublin, entrusted to Mr. Croker the parliamentary business connected with that country; and he fulfilled that trust with so much ability and discretion, that shortly afterwards Mr. Perceval, when he formed his ministry in 1809, offered to Mr. Croker the post of Secretary to the Admiralty. For upwards of twenty years Mr. Croker continued to discharge the duties of this post with unremitting application, under three successive First Lords of that department, and under the late King William when Lord High Admiral. During this time he sat in parliament for various boroughs, among others for Aylbrough, Yarmouth, and Bodmin; and in 1827 he had the satisfaction of being returned for the University of Dublin, on the elevation of Lord Plunket to the chancellorship and peerage, with whom he had twice unsuccessfully contested the seat: but his views being in favour of Catholic emancipation, Mr. Croker was subsequently defeated. He took a very active part in the parliamentary committee appointed to consider the question of erecting New London Bridge; and his zeal for science and literature was shown in another way soon afterwards, by founding the Athenæum Club. He was amongst the earliest advocates for a state encouragement of the fine arts. His speech on the proposed purchase of the Elgin marbles was much in advance of the general tone of parliament on such subjects. When the Reform Bill was proposed Mr. Croker opposed it at every stage by powerful speeches and a ready pen, as he considered it a revolutionary measure.

The passing of the Reform Bill compelled Mr. Croker to withdraw from parliamentary life. Even during the most active portion of his parliamentary career, his pen was seldom unemployed. His printed speeches and pamphlets on current political questions amount to a very considerable number, and his contributions to the 'Quarterly Review,' extending over more than a quarter of a century, would alone fill several volumes. His most extensive work is an edition of 'Boswell's Life of Johnson,' in 4 vols., 8vo, published in 1831, which was handled with considerable severity by Mr. T. B. Macaulay in the 'Edinburgh Review.' His poems of 'Ulm and Trafalgar,' and 'Taverners,' are the best known and most admired of his productions in verse. His 'Stories from the History of England' is a highly popular book for children. The following is a list of the most important works not mentioned above, which have been either published or edited by Mr. Croker: 'A Reply to the Letters of Malachi Malagrowther;' 'Military Events of the French Revolution of 1830;' 'Letters on the Naval War with America,' and 'Songs of Trafalgar.' He is also the author of several lyrical poems of merit, including

some touching lines on the death of Mr. Canning, to whom he was very firmly attached. Mr. Croker also edited 'the Suffolk Papers,' 'Lady Hervey's Letters,' 'Lord Hervey's Memoirs of the Reign of George II.,' and 'Walpole's Letters to Lord Hertford.' An annotated edition of Pope's works by Mr. Croker has been announced, and it has been stated that his contributions to the 'Quarterly Review' are about to be reprinted in a collective form.

CROKER, THOMAS CROFTON, was born January 15, 1798, in the city of Cork, Ireland. He was the only son of Major Thomas Croker, of the 38th regiment of foot. At the age of fifteen he became an apprentice in a mercantile establishment in Cork. Between the years 1812 and 1818 he made excursions occasionally on foot in the south of Ireland; and it was during these rambles that he commenced making his collections of the legends and songs of the peasantry of Ireland. In the year 1818, Moore, in an advertisement to the 7th number of the 'Irish Melodies,' expressed his obligations to him for about forty Irish airs which he had sent, for many curious fragments of Irish poetry, and for several interesting local traditions. Crofton Croker had also acquired considerable skill in making pen-and-ink sketches, and some of them were exhibited at Cork in 1818.

Major Croker died in 1818, and his widow soon afterwards made application to Mr. John Wilson Croker, then secretary to the Admiralty, who was a friend of the family, but no relation; and through his interest, in February 1819, Thomas Crofton Croker became a clerk in the Admiralty, with a salary of 2*l.* a week. While in this situation he contributed to the introduction of lithography into the Admiralty as a substitute for transcribing several copies of the same document, and for confidential circulars; and he had for many years the superintendence of the private lithographic-press of the Admiralty. He subsequently became a clerk of the first class, with a salary of 800*l.*; and he retired in 1850 with a pension of 580*l.*

Mr. Crofton Croker's first literary work was his 'Researches in the South of Ireland,' published in 1824, in 4to, and consisting for the most part of the notes made during his early excursions in 1812-18, and during a subsequent tour in 1821. His next work was the 'Fairy Legends and Traditions of the South of Ireland,' London, 1825, 3 vols. sm. 8vo. In the first edition of this work he was assisted by Dr. Maginn, Mr. Pigott, and Mr. Keightley; but the materials supplied by his assistants, or at least most of them, were afterwards omitted. A second edition was illustrated with etchings after sketches by MacIsc, then, as Croker states, "a young Irish artist of considerable promise." The 'Fairy Legends' appeared in 1834 in one volume, forming a part of the 'Family Library.' This work, when first published in 1825, produced a long complimentary letter from Sir Walter Scott; and on the 20th of October 1826, he was introduced to Sir Walter at the residence of Mr. Lockhart in Pall Mall. His personal appearance is thus described in Scott's Diary:—"Little as a dwarf, keen-eyed as a hawk, and of easy prepossessing manners, something like Tom Moore."

In 1829 Mr. Crofton Croker published 'Legends of the Lakes, or Sayings and Doings at Killarney,' collected chiefly from the Manuscripts of R. Adolphus Lynch, Esq., H.P., King's German Legion,' London, 2 vols. cr. 8vo. This work was followed in 1832 by two small novels—'The Adventures of Barney Mahoney,' and 'My Village versus Our Village,' of which the first was very favourably received, but the second less so. In 1839 he edited, with very copious notes, 'The Popular Songs of Ireland,' 12mo. He was a contributor to some of the annuals which were in fashion about 1830-40, especially to 'The Amulet,' and 'Friendship's Offering;' and he edited for two or three years 'The Christmas-Box.' He wrote many small articles, some for magazines, and some which were printed privately. He was a constant contributor to the early volumes of 'Fraser's Magazine,' frequently to 'The Literary Gazette,' and occasionally to 'The New Monthly Magazine.' He had always a taste for antiquities, and he was early elected a Fellow of the Society of Antiquaries. He was chosen a member of the Royal Irish Academy in 1827. He took part in the foundation of the Camden Society in 1839, and of the Percy Society in 1840. He was a member of the council of both these societies, and he edited some of the works published by them. When the British Archaeological Society was founded, in 1843, he became one of the committee. He was also a member of the United Service Institution, of the Irish Archaeological Society, of the Numismatic Society, of the Hakluyt Society, and he was perpetual president of the club of antiquarians called the Society of Noviomagians. He had collected an extremely interesting museum of Irish antiquities, which was sold by auction after his death. He died at his residence, Old Brompton, London, August 8, 1854.

(Gentleman's Magazine, &c.)

*CROLY, REV. GEORGE, LL.D., rector of St. Stephen's, Walbrook, and St. Benets, was born in Dublin in 1780, and educated at Trinity College. His first publication was a poem, 'Paris in 1816.' The 'Lines on the Death of the Princess Charlotte' appeared in 1818, and the 'Angel of the World' in 1820. Several satires, a volume of songs and miscellaneous poems, and his tragedy of 'Catiline,' were produced soon after. In 1824 he wrote his comedy of 'Pride shall have a Fall;' his romance of 'Salathiel' was published in 1827; and he has also written two other popular works of fiction, 'Marston' and 'Tales of the Great St. Bernard,' as well as a 'Life of Burke,' and descriptive

essays, &c., accompanying Roberts's 'Holy Land.' His poetical works have been published in 2 vols. 8vo. Dr. Croly's rare talent as a pulpit orator however has acquired for him a more extended fame than his poetical and imaginative writings. Several of his more remarkable sermons have been published.

CROMWELL, OLIVER, the son of Robert Cromwell, M.P. for Huntingdon in the parliament of 1593, and his wife Elizabeth, daughter of Sir Richard Stuart, was born in St. John's parish in the town of Huntingdon, on the 25th of April, 1599, and named after his uncle and godfather, Sir Oliver Cromwell, a worthy member of his ancient and respectable family. Many idle stories of his childhood and early youth are related by Noble and some others of his biographers, but without any sufficient authority, and there is really nothing authentic known respecting him prior to April 23, 1616, when, having left school at Huntingdon, he was entered at Sidney College, Cambridge; his tutor being Mr. Richard Howlett. He remained at college little more than a year. At the death of his father, which occurred in June 1617, he was removed from the university by his mother, who is said to have thought it more prudent to enter her son at Lincoln's Inn, that he might follow the profession of the law, but there is no entry of his name on the registers of that or either of the other Inns of court. The old account of him goes on to say that Oliver, with little intention to use them for their proper purpose, took possession of his chambers, but being no longer restrained by the vigilance of his father, he gave himself up to profligate habits, and became addicted to gambling; and that continuing for the next two or three years to live this dissolute life he forfeited the friendship of his uncle Sir Oliver Cromwell. But the only authority for such statements are the royalist writers, who seem to have taken a strange delight in vilifying the man who had wrought such ruin to their cause. All that is certain is that soon after having completed his twenty-first year, he was married August 22, 1620, to Elizabeth, the daughter of Sir James Bourchier, and that at this time he was closely united with the puritan party, and himself, in their phraseology, "a professor of religion." The next clearly ascertained circumstance in his history is his election as member for the borough of Huntingdon in 1628—a proof that he had thus early succeeded in gaining the confidence of his neighbours, perhaps also that he had already begun to take an active part in local politics. In February 1629 the House of Commons having resolved itself into a grand committee on religion, Cromwell made a speech calling attention to the encouragement by the Bishop of Winchester of the "preaching of flat popery," and steps were in consequence ordered to be taken for procuring evidence against the bishop; but before any further proceedings could be taken the king dissolved the parliament (March 2). The king, by this impolitic dissolution, still further irritated his enemies. Cromwell returned home certainly no more loyal a subject, while his puritanism had been not a little strengthened by his contact with episcopacy. It has been said that his house now became the common resort of those who were of the same way of thinking, and that his hospitality to them increased his expenses until his circumstances became so much embarrassed that a portion of his property was necessarily sold. But this again appears to be only a late scandal. He did however it is certain in 1631 sell his property in Huntingdon, of which place he had been made a justice of the peace in the previous year, and take a grazing farm at St. Ives, where he resided for the next four years, diligently pursuing his new occupation, acting as overseer of the parish, and evidently the leading man among his co-religionists in that part of the country. In January 1636, by the death of Sir Thomas Stuart, his maternal uncle, he became possessed under his uncle's will of property in the Isle of Ely amounting to nearly 500*l.* a year. Here he continued to reside till 1640, and his family for some years longer. But disgusted with the proceedings of the court, he had determined in 1637 to emigrate to America, and having taken a passage to New England in a ship then lying in the Thames, embarked with his whole family. The vessel was however detained by a proclamation forbidding such embarkations, unless under a licence from the government, which he knew that he should be unable to procure. He returned therefore to Ely; but notwithstanding he saw few persons of importance, the activity and vigour of his understanding became generally known: his open advocacy of principles opposed to the government, and the zeal with which he resisted an attempt of certain proprietors to drain some of the neighbouring Cambridgeshire fens, and secure to themselves the drained land, attracted the favourable regard of many public men, and made him so popular in the district that he was commonly spoken of as "Lord of the Fens." In such esteem was he held, that he was elected representative of the town of Cambridge, in opposition to Counsellor Mewtis, the court candidate, both to the short-lived parliament of 1640, and afterwards to the Long Parliament, by which it was speedily followed.

Cromwell was now in the middle age of life: his health was strong, and his judgment matured: so far circumstances were favourable to his further elevation. But he had deficiencies not only in fortune but in person and in manner, which precluded all foresight of the height to which he would rise. The description given of him by Sir Philip Warwick on his entrance to the House of Commons, at the beginning of the Long Parliament, displays in a striking manner his uncourtly

rusticity:—"The first time that ever I took notice of him was in the very beginning of the parliament held in November 1640, when I vainly thought myself a courtly young gentleman (for we courtiers valued ourselves much upon our good clothes). I came one morning into the house well clad, and perceived a gentleman speaking (whom I knew not), very ordinarily apparelled; for it was a plain cloth suit, which seemed to have been made by an ill country tailor; his linen was plain, and not very clean; and I remember a speck or two of blood upon his little band, which was not much larger than his collar; his hat was without a hat-band; his stature was of a good size; his sword stuck close to his side; his countenance swollen and reddish, his voice sharp and untunable, and his eloquence full of fervour; for the subject-matter would not bear much of reason." And Sir Philip protests that "it lessened much my reverence unto that great council, for he was very much hearkened to. And yet," he continues, "I lived to see this very gentleman, whom out of no ill-will to him I thus describe, by multiplied good successes, and by real but usurped power, having had a better tailor and more converse among good company, in my own eye, when for six weeks together I was a prisoner in his sergeant's hands, and daily waited at Whitehall, appear of a great and majestic deportment and comely presence." ('Memoirs,' p. 247.) This description of Warwick's as to his rude presence at this time is strongly corroborated by a coarse passage in an intemperate sermon preached after the Protector's death by Dr. South, in which he thus speaks of Cromwell's appearance when attending the Long Parliament:—"Who," says he, "that beheld such a bankrupt beggarly fellow as Cromwell first entering the parliament house, with a threadbare torn cloak and a greasy hat (and perhaps neither of them paid for), could have suspected that in the space of so few years he should, by the murder of one king and the banishment of another, ascend the throne, be invested in the royal robes, and want nothing of the state of a king but the changing his hat into a crown." He had as yet had no opportunity for displaying the extent of his energy and abilities; the time was at hand when they were to be proved. It is plain however that Cromwell was taking his place as a leader in the great popular movement. His disregard of courtly manners was not likely at such a time to be any hindrance to the earnest men now resolutely bent on having their 'grievances' redressed. His fervid eloquence, however unpolished, found eager listeners, and his sagacious counsels ready acceptance. 'Mr. Cromwell' was soon a marked man in the great council of the nation; and he was one of the very first to contribute in pocket and person to the active resistance which soon was raised to the royal measures. The tyranny and maladministration of the weak and obstinate Charles had become the subject in 1641 of a strong remonstrance from his parliament, which at once insured their rupture with the king. Cromwell, now associated in the councils of Hampden, Pym, and the rest of the popular leaders, strenuously supported this remonstrance; and in 1642, when the civil war commenced, he eagerly raised a troop of horse, under the authority of the parliament, with which he immediately took the field in their cause; and 'Cromwell's Ironsides' were the first of the parliamentary horse who successfully withstood Rupert's cavalry. From the first moment of receiving his commission he was one of the most active and energetic of the parliamentary officers, and he was rapidly promoted to be colonel, governor of Ely, and otherwise placed in posts of honour and trust. In numerous skirmishes in which he engaged he only once met with any serious misadventure. This was at the 'fight of Winceby,' in Lincolnshire, when his horse being shot under him, on attempting to rise he was knocked down by a cavalier, and with difficulty rescued by his own party.

Notwithstanding the comparatively advanced age at which Cromwell first buckled on the sword, all writers bear testimony to the military abilities that he displayed throughout the succession of battles between the parliamentary and royalist forces. At Marston Moor, at Stamford, and in the second battle of Newbury, he was especially distinguished. With the title of lieutenant-general of the horse he soon became, under Fairfax, the chief mover of a victorious army; and so valuable were his services considered by the parliament, that he was exempted from obedience to the 'self-denying ordinance'—an injunction which excluded the members of either house from holding any command in the army. This measure was brought forward by Cromwell's friends, who trusted to his popularity in the parliament, and the necessity that it had for his services, to procure an exception in his favour. The result fully answered their expectations: his rivals were set aside, his power more widely spread, and a greater scope given to his ambition. At the battle of Naseby (June 1645) Cromwell commanded the right wing, and Ireton, his son-in-law, the left; the main body of the royalists was commanded by the king in person. As the troops were nearly equal, the event of the day was looked for by each side with anxious hope. Ireton was repulsed early in the day; but Cromwell and Fairfax, taking advantage of Prince Rupert's temerity, totally dispersed the king's infantry, and took his artillery and ammunition. Flated with victory, the parliamentary army, under the same leaders, vigorously prosecuted their success, until they had reduced most of the royalists in the west, Cromwell at the storming of Bristol and on various other important occasions taking the principal part. Having in 1646 found leisure to return to London, the thanks of the parliament were voted to him; his services were publicly acknowledged, and

rewarded by a grant of 2500*l.* a year, to be raised from Lord Winchester's estates.

The king, who had passed the winter (1645-46) at Oxford, in a condition to the last degree diastrous and melancholy, in the month of May escaped from that city in disguise, and threw himself upon the protection of the Scottish army, then encamped at Newark. After some negotiations, he was delivered up by the Scots to the parliamentary commissioners, who kept him prisoner at Holdenby, in Northamptonshire. In proportion as the king's power had diminished, the division between the Independents and Presbyterians had become daily more apparent. In the army, the majority, with Cromwell at their head, were Independents; in the parliament, Presbyterians. Each body, jealous of the other's power, began to strive for the mastery. At length the army rebelled against the parliament; and Cromwell, aware of the advantage that would be gained by the possession of the king's person, directed one Joyce, a young and enterprising soldier, to rescue the king from the hands of the commissioners of the parliament, and to deliver him to the army (June 1647). This scheme was quickly put into execution. Cromwell declared that he deeply regretted the disaffection which the army showed towards the parliament, but the members were not deceived. The Presbyterian members resolved, as soon as he should come into the House of Commons, to accuse the lieutenant-general of having promoted this schism, and to commit him to the Tower. Intelligence of these proceedings was quickly carried to the army; and Cromwell, perceiving that the crisis was desperate, and that some decided step must instantly be taken, hastened to the camp, where he procured himself to be invested with the chief command, and then, threatening the unpopular parliament, marched southward to St. Alban's.

As long as there remained any balance between the rival powers in the state, each sought the support of the royal name, and the king's cause appeared not altogether hopeless; he was courted alike by the Presbyterians and by Cromwell. But when the leaders of the army established their dominion, the case was altered. At a conference at Windsor, opened with prayers by Cromwell himself, he announced that he had given up all belief in the royal promises, and opened the daring counsel of punishing the king by judicial sentence. The time however was not quite at hand for this bold measure. The king was left in custody in the Isle of Wight, and Cromwell again took the field against the Scots in the north and the Welsh in the west, making preparations at the same time to resist an invasion from Holland threatened by Prince Rupert, to whom seventeen English ships had deserted. Again he was victorious; and his army returned to London, where they broke violently into the parliament-house while the members were in debate, seizing some, and excluding others, by the direction of Colonel Pride. The king's trial now (January 1649) commenced. Cromwell was appointed a member of the court, and attended every meeting of it but one; and when the sentence was passed he was the third who signed the warrant for the execution. He was now beset with entreaties to spare the king's life, but his answer to all was an echo of that to his cousin Colonel Cromwell: "Go to rest, and expect no answer to carry to the prince, for the council of officers have been seeking God, as I also have done, and it is resolved by them all that the king must die." The execution followed accordingly. Five days afterwards the House of Lords was voted useless; and a council of state was formed, with Bradshaw for president and Cromwell a principal member. Difficulties soon crowded round their government. A mutiny broke out in the army, which required the immediate presence of the lieutenant-general, but was soon suppressed by him, after the execution of three of the ring-leaders.

In Ireland the majority were still hostile to the parliament, and an army had been sent there to reduce the royalists to subjection. Cromwell having been appointed Lord-Lieutenant and Commander-in-Chief in Ireland, joined the troops in August 1649. He besieged and took Drogheda (or Tredah as it was then usually called) by storm, gave no quarter to the garrison, and proceeded to capture Wexford, Kilkenny, and Clonmell. Wexford, like Drogheda, resisted, and was stormed, 2000 of the garrison found within being put to death; the other towns terrified by so frightful a slaughter at once surrendered. In nine months the country was nearly subdued. Satisfied with his success, he left to Ireton the conduct of the troops against his panic-struck adversaries; and having sailed for Bristol, proceeded to London, where he was received with fresh honours by the parliament.

The children of the late king had suffered deeply from their fallen fortunes: one had died of grief at her father's execution, another had been sent out of the kingdom by Cromwell, and Prince Charles, the heir to the crown, poor and neglected, had lived sometimes in Holland, at other times either in Jersey or in France. At length he was induced by the Scottish army to take shelter among them, a protection which he bought by subscription to the covenant, and submission to restrictions so severe as almost to render him a prisoner. Whatever might be the circumstances under which this junction was formed, the return of Charles to his kingdom could not fail to alarm the English. It was instantly resolved to march northward with all the troops that could be raised. Fairfax, himself a Presbyterian, refused to lead the forces, and Cromwell was therefore nominated to the command, and became the general of the Commonwealth. This

vast accession to his power induced him to resign the lieutenancy of Ireland; the prospect of removing Ludlow to that post is said to have formed an additional reason for his withdrawal. Cromwell was thought to be jealous of the influence of Ludlow, who, though he did not receive this appointment, was ultimately set aside by his promotion to an official situation in that kingdom. After these and other preparations, he began his march with 16,000 men (1650). He reached the neighbourhood of Edinburgh unopposed, but at Musselburgh the Scottish army under Leslie was encamped, and there the two armies continued for nearly a month watching each other. At length Cromwell withdrew, and his opponents followed him to Dunbar, where a battle became inevitable. The battle of Dunbar was gained by the English, and Edinburgh and Perth were taken. Upon this the king suddenly marched into England. Cromwell, who had not expected this movement, sent expresses to the parliament to inform them of what had taken place, and with forced marches pursuing the king, brought him to an engagement near Worcester, the result of which was a total defeat of the royalists (September 3, 1651). For this complete victory the parliament rewarded him with fresh honours and an additional pension of 4000*l.* a year.

The battle of Worcester placed Cromwell avowedly at the head of public affairs. His views of the kind of government required by the state of the nation were, according to Whitelock, now shadowed forth at a meeting of army officers and members of parliament, which he called together at the speaker's house immediately on his arrival in town. He told them that what the nation plainly needed was a settlement with somewhat of monarchical power in it. He had made up his mind that there must be government by a single person whatever was the title he took: perhaps he thought that he was that person. But it was not the right time yet. War broke out with Holland, and that fully occupied his attention and engrossed the thoughts of the nation. At length (1653), perceiving that the remnant of the parliament became daily more jealous of his power, he determined to put an end to their authority. He first sent them a remonstrance; his next movement was to enter the House (April 20, 1653) with an armed force, seize the mace, and to declare to them, "You are no longer a parliament: the Lord has done with you; he has chosen other instruments for carrying on his work." Loading the members with abuse, he drove them before him out of the House. Thus was the memorable 'Long Parliament' dissolved: and with it disappeared all regularly constituted authority. Power, self-assumed, was wholly in the hands of Cromwell: but it was as captain-general that he wielded it. He now formed an interim council of state, composed chiefly of his principal officers, and their first step was to summon by name 139 persons, some gentry, some mechanics, all of them puritans, and to constitute them a parliament. It was obvious that such an assembly could in no way assist in the government of the realm. They met for the first time on the 4th of July 1653. One measure only seemed to be expected from them, and that they quickly determined upon; it was to surrender (December 12, 1653) their power to Cromwell, who, after their voluntary resignation, was declared 'Protector' by a council of the officers of his army, and solemnly installed into his dignity, February 16, 1654.

The first charter of the Commonwealth was drawn up by the same council of officers: it was called the 'Instrument of Government.' The second, called the 'Petition and Advice,' was framed in May, 1657, by the parliament which the Protector had assembled in the previous year. Under the first charter, the English government may be ranged among republics, with a chief magistrate at its head. Under the second it became substantially a monarchy, and Oliver Cromwell, from 1657 to his death, was de facto king of England. (Hallam, 'Const. Hist.' ii. 421.) The difficulties of his administration were great, but they were surmounted by his vigorous abilities, which shone forth as much in wielding his power as in obtaining it. That he was both arbitrary and despotic cannot be denied. Such was the temper of the country, and, notwithstanding his general popularity, such the number of his open or secret enemies, that immediate and forcible action, though sometimes illegal and tyrannical, was absolutely required. There were opposed to him the royalists, who were still numerous; the nobility, to whom he was hateful; the whole body of Presbyterians, who were jealous of having no share in the power which they had helped to gain; and in the army, the mutinous and disaffected 'Levellers.' Severe measures then were requisite, and at times they certainly were used,—not, however, without apparent reluctance. The point that seemed most to perplex him was the calling together of parliaments: he would neither reign with them nor without them. His first parliament met in September 1653; he found it as intractable as Charles had found his parliaments, and he abruptly dissolved it in the following January, in direct contradiction to the advice of Whitelock and his friends generally, who recollected the abuse that had been poured upon King Charles under similar circumstances. In 1656 his successes at home and abroad encouraged him to assemble another parliament. Ireland, being in the hands of the army, elected such officers as he nominated; Scotland was nearly equally subservient to him; still the majority was unfavourable to his policy. The next step was difficult. He ordered the doors of the House of Commons to be guarded, and that no member should be admitted unless he produced an order from his council. Thus he excluded nearly one

hundred members who were obnoxious to him. Thus 'purified,' this assembly voted a renunciation of all title to the throne in the family of the Stuarts; and Colonel Jephson moved that the crown should be bestowed upon Cromwell. A conference was soon afterwards appointed (1657), at which the Protector's scruples respecting the assumption of the title of king were stated and argued. His mind was wavering whether he should accept or whether he should forbear. But his prudence ultimately prevailed; he knew that the danger of ascending would be imminent, while the increase of power would be trifling; the odium in which the army had been taught to hold the regal title could never be overcome, and therefore he consented unwillingly to reject it. The proposition for a house of lords, which accompanied the offer of the crown to himself, he however adopted; and an upper house of sixty-three persons was summoned, January 20th, 1658. But this experiment failed; the houses neither agreed with each other, nor supported him; and on the 4th of February, after a session of only a fortnight, they were unceremoniously dissolved.

As Cromwell's treatment of his parliaments was arbitrary, so also were his dealings with the courts of justice. He degraded three judges, and so intimidated the barristers that they feared to uphold clients whose causes were contrary to the Protector's wishes. To give an instance of this oppression—One Cory having refused to pay the heavy tax of ten per cent. which was ordered to be levied upon the property of all royalists, sued the collector. Three eminent counsel, Maynard, Twisden, and Wyndham, were employed in his cause; but Cromwell, without suffering them to enter into their argument, sent them to the Tower even for accepting the brief. Sir Peter Wentworth having brought a similar action, was asked by the council if he would give it up. "If you command me," he replied to Cromwell, "I must submit." The Protector did command, and the action was withdrawn. Equally tyrannical were the means which were used for the erection of the courts, by which, in 1654, Gerard and Vowel, and; in 1658, Slingsby and Hewit, were brought to the scaffold. These, and similar acts, rendered Cromwell hateful to a large number of his subjects. He had suppressed some royalist insurrections at Salisbury, and executed the leaders in 1655; but now he entertained fears from the republicans also. Major Wildman, a republican, was arrested for a conspiracy against him; and such was the ill-will shown to him by the democratic soldiery as to cause anxiety for his personal safety. One Sindercome, who by an accident alone had been prevented from murdering him, was arrested and condemned; but he committed suicide before the day appointed for his execution.

The foreign policy of the protector was magnanimous, enterprising, and ultimately successful. He interfered more than would be regarded as tolerable now; but his interferences were generally to protect the oppressed; and by his firmness and prudence he made his government respected by foreign princes as scarcely any English government had ever been before. Many memorable victories were achieved under the parliament and under Cromwell. "It is just to say," observes Mr. Hallam ('Const. Hist.' vol. ii.), "that the maritime glory of England may first be traced from the era of the Commonwealth in a track of continuous light." A treaty, consequent on the successes of Blake, was honourably concluded with the Dutch. An expedition, more politic than just, was made against the West India colonies of Spain; it ended in failure and disappointment, although it gained for England the island of Jamaica, a greater and more advantageous possession than many triumphs have produced. An alliance was concluded with France in 1656 to act in conjunction against the Spanish forces in the Low Countries; Mardyke and Dunkirk were taken, and the Spaniards were afterwards wholly defeated at Dunes. Denmark, Portugal, and Sweden eagerly sought the protector's friendship; ambassadors flocked to his court, bearing the most conciliatory and adulatory messages. The anxiety of all princes to be allied with so recent an usurper is in fact not a little remarkable. The servility of some powers was extreme, as has been proved by several curious instances which have been collected by Mr. Harris. ('Life of Cromwell,' p. 352; and see the Appendix to Guizot's 'Life of Cromwell'.)

Towards the end of his life, Cromwell appears to have become moody and suspicious. He knew that he had few personal adherents, that his life was in danger from the more unscrupulous of both the parties whose hopes he had crushed, and all whose machinations he had hitherto discovered and thwarted. He saw too that neither in his own family nor among the public servants were there any fitted to carry on the work he had commenced. That he was personally unpopular, that his government was hateful to the people, he could have little doubt; and no wonder is it therefore that as he felt age rapidly coming on and health failing he should have grown melancholy, and looked with gloomy anticipations to the future. His death was hastened by that of his favourite daughter, Lady Claypole, who died at Hampton Court, August 6, 1658, aged twenty-nine. A fortnight later he himself was stricken down by fever. By the advice of his physicians, he was removed for better air to Whitehall, and there he died, on the 3rd of September 1658, the anniversary of the victory of Dunbar, and of the 'growing glory' of Worcester. His body was laid in state at Somerset House, and then buried with the utmost possible solemnity in that famous sepulchre of the kings, Henry VII.'s Chapel at Westminster. But after the restoration his corpse was disinterred, and having been by the orders of the poor-spirited monarch first hung

on the gallows at Tyburn, the head was fixed upon a pole at Westminster Hall, and the rest of the poor remains were thrust into a hole at the foot of the gallows.

The character of Cromwell has formed a fertile subject for historians and essayists. We have no intention to add to the number. It may be enough here to remark that the real greatness of the man, whatever be thought of his conduct in seizing on the supreme authority, is now becoming more and more generally understood and acknowledged by thoughtful men of all shades of opinion. For this better appreciation of Cromwell, much is undoubtedly due to his 'Letters and Speeches,' as edited and 'elucidated' by Carlyle; and to that work we refer the student who is desirous of coming as near as may be to the inner workings of Cromwell's mind, and of understanding the real significance of this great period in English history. He will do well also to peruse carefully the calm and impartial examination of Cromwell and his times by one of the most distinguished of living French statesmen, M. Guizot, whose position and experience, no less than his attainments and ability, eminently qualify him for such a task.

The resemblance between the fortunes of Cromwell and of him who in more recent times raised himself from insignificance to a throne, is strong enough to strike the generality of readers. Mr. Hallam has stated ('Const. Hist.') the most striking points in the parallel. But the conclusion of Bonaparte's life was very unlike that of the Protector; the fortunes of one had declined for years before his death, the other retained his authority to the last hour.

Cromwell left six children, two sons and four daughters. Of the daughters, Bridget was twice married, first to Ireton, and afterwards to Fleetwood; Elizabeth was the wife of John Clayton, Esq.; Mary married Lord Fauconberg; and Frances was wife first to Mr. Rich and afterwards to Sir John Russell of Chippingham. The sons are noticed below. His widow survived till 1665, when she died in the house of her son-in-law Claypole, at Norborough in Lincolnshire.

(Clarendon, *Hist. of Rebellion*; Hallam, *Const. Hist.*; Noble, *Memoirs of Cromwell's Family*; Tracts on the Civil Wars; Harris, *Life of Oliver Cromwell*; Carlyle, *Oliver Cromwell's Letters and Speeches*; Southey; Guizot; Villemain; and the various *Histories of England*.)

CROMWELL, RICHARD, the third son of Oliver Cromwell the Protector, but the eldest that survived him, was born at Huntingdon on the 4th of October 1626. He was educated at Felstead, in Essex, with his brothers Henry and Oliver, and thence removed to Lincoln's Inn, where he was admitted in 1647. His study of the law was only nominal, his time being in fact to a great extent wasted in the pursuit of pleasure. Although he had arrived at an age when it would have been most natural for him to have desired to join his father's troops, he appears to have shown little inclination to do so. Besides indolence and apathy, many causes have been assigned for this want of enterprise; some have supposed that his father would not suffer him to take arms; others, that Richard Cromwell's political opinions differed from the Protector's; and that as his companions were chiefly cavaliers, and the king's health had often been drunk at their carousals, he was favourable to the royal rather than the parliamentary cause. There is however no clear evidence to prove this last fact, unless we may reckon as such the fact that Richard, averse to spilling blood, when the king was condemned, petitioned his father for a remission of the sentence.

At the age of twenty-three he married Dorothy, the eldest daughter of Richard Major, Esq., of Hursley, in Hampshire, a lady sprung from a good family, endowed with many virtues, and possessed of a considerable fortune. This change in his circumstances induced him to leave his residence in London, and to establish himself at Hursley, where he lived in complete retirement, following the sports of the field and other rural pursuits. As soon however as Oliver Cromwell was made Protector, he called Richard from his obscurity, and nominated him for the counties of Monmouth and Southampton, for which he was elected member of parliament in 1654. His appointment as first lord of trade and navigation followed his election. In 1656, he was again chosen member of parliament for Hampshire and the University of Cambridge; and in the following year succeeded his father in the chancellorship of Oxford.

An accident now befel him which nearly cost him his life. After a levee held by the Protector, whilst he and other members of parliament were standing on the upper steps within the banquetting-house, the supporters gave way, and the whole staircase fell with an alarming crash; youth and a good constitution alone enabled him to recover from the fractures and other injuries that he sustained. After his health was restored, his father, still anxious for his elevation, made him a privy councillor, a colonel in the army, and leader of the newly-constituted House of Lords. When his father felt that his life was drawing to a close, in the summer of 1658, he sent for his eldest son to attend him in his sickness. Richard Cromwell immediately obeyed the summons, and found the symptoms of his father's illness such as to make him extremely apprehensive for its result. In a letter written in August to a friend near Abingdon ('Parl. Hist.' 21, p. 223), he expresses in feeling and sensible terms the fears which he entertained for his life. On the 3rd of September 1658, Oliver Cromwell died, and on the next day Richard Cromwell received the sceptre of the Commonwealth.

For a short time the peace of the kingdom was undisturbed, and

respect was paid to the new Protector at home by his subjects, and abroad by all foreign states. Thurloe, Whitelock, and Broghill were his chief counsellors, and in ordinary circumstances they would have made judicious advisers. But they were, in the face of so many opposing elements, incompetent to their task: and Richard Cromwell was wholly devoid of the energy which his affairs demanded. In such hands tranquillity could not long be maintained: the aspect of affairs very soon began to change. Discontents prevailed; the want of resources was felt; it became necessary to call a parliament (1659), for there was in the treasury no money with which to fulfil the engagements with foreign princes, that had been entered into by the late Protector. It was feared that the elections would go against the court; and every means were therefore taken to bias them. Oliver Cromwell's reformed model of representation was abandoned, and the right of returning members was restored to small boroughs, which, from gratitude, it was thought would be favourable to the court: but notwithstanding this, and all the other efforts of the government, the number of presbyterian and republican members nearly equalled that of the ministerial party. In the parliament, then, the weakness of the Protector's government was most apparent. Still it was to this body that he must trust; for in the army he had scarce any friends at all; the whole republican party were combining against his authority; Lambert was intriguing for his overthrow: even Fleetwood, his own brother-in-law, joined the discontented officers, whose faction, from the name of Fleetwood's house, in which they met, was called the 'Cabal of Wallingford House.' Richard, who possessed neither penetration nor resolution, took no step to subdue these rebels; the parliament, more alarmed, took the case in their own hands. A vote was passed that no council of officers should assemble without the Protector's consent: this brought the rupture to a crisis. The army demanded the dissolution of the parliament, which the Protector wanted resolution to deny. The dissolution was equivalent to his dethronement, and he soon afterwards signed his demission in form (22nd April 1659). His brief reign ended, Richard Cromwell descended into humble life, to the enjoyment of which his feeble unambitious character was better adapted than to the possession of power. He had no qualities which fitted him to rule. He was burdened with debts, arising partly from the pompous funeral of his father, the cost of which, amounting to 28,000*l*, the state unworthily suffered to descend upon him. To assist him in these difficulties, the parliament voted him 20,000*l*, annexing a condition that he should leave the palace of Whitehall. In consequence of this grant, he retired to Hampton Court, but so small a portion of the money was paid, that he was still in danger of being arrested by his creditors. To leave England was his only method of escape from them, and accordingly he resided sometimes in Geneva and sometimes at Paris. At length he ventured to return to this country: a house was hired for him at Chesbunt, near London, where at first he concealed himself under a feigned name, and continued to live in strict privacy, until the year 1712, when he died in his eighty-sixth year.

Richard Cromwell was the father of two sons and seven daughters: four of his children died young, and two only survived him.

(Hallam, *Const. Hist.*; Noble's *Memoirs*; Guizot, *History of Richard Cromwell and the Restoration*—especially the valuable documents in the Appendix; and the various *Histories*.)

CROMWELL, HENRY, the fourth son of Oliver Cromwell, Lord Protector, but the second and youngest that survived him, was born at Huntingdon in January 1627-28. He was educated at Felstead in Essex, and early enrolled in the parliamentary army. In 1649, having become a colonel, he went with his father to Ireland, where he behaved with considerable gallantry. He was one of the members for that kingdom in the Bare-Bones Parliament. He married in 1658 a daughter of Sir Francis Russell of Chippenham in Cambridgeshire, and resided at Whitehall until he was appointed Lord Deputy of Ireland, being at the time (1654) a member for the University of Cambridge. During the following year he was again sent to Ireland. It had become absolutely necessary that the estates and property of the natives should be protected from the rapacity of the republican leaders, who were aggrandising themselves at their expense; and Henry Cromwell was considered a fit person to undertake this task, both on account of his general abilities and the great esteem in which he was held in that country. The expectations of his friends were not disappointed, for the state received considerable benefit from his services as soon as he succeeded Fleetwood in his office. The impossibility of procuring money from England, and the limitations of his power, materially diminished his usefulness. At length, from these causes, his government became so irksome to him that his letters are one series of complaints, interspersed with offers to resign. Still further mortification however was in store for him. When his brother Richard became Protector, the council, over which he had little or no control, contracted still further the power of Henry Cromwell, who, in exchange for the title of Lord Deputy, received that of Lord Lieutenant—a miserable recompense for his lost authority.

After the deposition of his brother, Henry Cromwell was desirous of keeping Ireland for the king, and it was not until his submission was forcibly required by the parliament, that his object was finally relinquished. Henry now retired to Chippenham, whence in five or six years he removed to his estate at Soham in Cambridgeshire, where

he spent the remainder of his days, and died at the age of forty-six (1673-74). Henry Cromwell had five sons and two daughters: one of his children died young; the rest survived him.

CROMWELL, THOMAS, was born at Putney, near London, where, as is said, his father was a blacksmith, and afterwards a brewer. The date of his birth is not recorded, but it was probably about 1490. He was taught reading, writing, and a little Latin; and as soon as he grew up went to the continent, where he learned several foreign languages. He became clerk in an extensive factory at Antwerp, whence he was taken to Rome (1510) by some citizens of Boston in Lincolnshire, who thought that he would be of assistance to them in some business that they had with the pope. During this journey he learned by heart Erasmus's translation of the New Testament, and he continued to improve himself during his residence in Italy. Foxe states that Cromwell was present at the sack of Rome by the Duke of Bourbon, but this must be erroneous, as that event did not occur till 1527, whereas it is almost certain that he was in the service of Wolsey as early as 1525. Dr. Lingard says that "in his early youth Cromwell served as a trooper in the wars of Italy, and from the army passed to the service of a Venetian merchant," on quitting whom he returned to England. It is in fact highly probable that he returned to England in or about 1517, as somewhere about that time he married the daughter and heiress of Sir John Prior, knight, and widow of a Welsh gentleman named Williams. On his return to England Cromwell was received into Cardinal Wolsey's house, became his solicitor, and the chief agent in the foundation of his colleges at Oxford and Ipswich. He was also chosen a member of the House of Commons, where he increased his fame by his defence of Wolsey, who had there been indicted for treason. After the cardinal's disgrace, Cromwell was taken into the service of the king; in 1531 he was knighted, and made privy-councillor and master of the jewel-house. It is said that about this time Cromwell first suggested to Henry the project of throwing off the supremacy of the pope in ecclesiastical affairs. Certain it is that from this time he became the close confidant and adviser of the king, and that he rapidly rose to the most important offices in the state. In 1532 he became clerk of the hanaper in the Court of Chancery, and afterwards chancellor of the exchequer; in 1534 he was principal secretary of state, master of the rolls, and chancellor of the university of Cambridge; in 1535, visitor-general of English monasteries; and in 1536 keeper of the privy seal. He now resigned the mastership of the rolls, and was created Baron Cromwell of Okeham in Rutlandshire, and appointed vicar-general and vicegerent, in all religious matters the next in authority to the king, who was now the supreme head of the English church. His friendship with Cranmer was intimate, and their views respecting the Reformation very similar. It being Cromwell's object to destroy the pope's authority, he circulated new articles of faith, and enjoined the clergy to preach the king's supremacy, to remove images from their altars, and to promote the religious education of all young persons, teaching them the Creed, the Lord's Prayer, and the Ten Commandments. He commanded English Bibles to be placed in the churches, and took active means for the dissolution of the monasteries. These alterations, together with the great increase of his wealth, some of which it was suspected that he obtained by dishonest means, rendered him extremely unpopular, so that there were not wanting many enemies who endeavoured to prejudice the king against him. The king's esteem for him could not however be shaken: in 1537 he was appointed chief justice of all forests beyond Trent, and in August in the same year was elected knight of the garter, and nominated dean of Wells. The long list of Cromwell's titles and official appointments is still far from completed. In 1538 he was made constable of Carisbrook castle, and obtained a grant of the castle and lordship of Okeham. About this time he issued various injunctions [CRANMER] to the clergy, by one of which parish-registers were established; and in 1539, after having received from the king some thirty monastic manors and valuable estates, he was created Earl of Essex, and named lord chamberlain of England; at the same time Gregory, his son, obtained the barony of Okeham.

Hitherto there had been little check to the career of Cromwell's prosperity: his favour at Court had always been sufficient to stifle any popular complaints, but he now became aware that both Cranmer and himself were declining in the royal estimation. Gardiner (bishop of Winchester) and his party had gained some ascendancy over the king, and in proportion as the power of these advocates of the Roman Catholic faith increased, the influence of the reformers declined, and both they and their doctrines became unacceptable at court. In order to regain his former ground, or at least to intrench himself firmly in the powerful position which he still retained, Cromwell lost no opportunity of promoting Henry's marriage with Anne of Cleves, taking care to set before the king, as often as circumstances permitted, the many advantages which would arise from such a union. The cause of Cromwell's great zeal was this: Anne and all her friends were Lutherans, and Cromwell counted upon great support from a queen of his own choice, whose religious opinions were in direct opposition to the Roman Catholics. The complete failure of this scheme became the ruin of its contriver. An aversion to the promoter of the marriage quickly followed the king's disgust and disappointment at his ugly bride, and Henry now willingly opened his ears to the flood of complaints which were poured into them from every quarter

To the laity Cromwell was hateful, on account of the oppressive subsidies that he had raised notwithstanding the large sums which had accrued from the dissolution of the monasteries; to the nobility he was still more odious, on account of the titles and power that he had obtained notwithstanding the meanness of his birth; and to the Roman Catholics he was an object of aversion and horror, on account of the Protestant doctrines that he held and promulgated. As soon then as it was apparent that the capricious king, who had elevated him from an humble individual to be the most powerful subject in the realm, was no longer willing to support him, his downfall was certain. The numerous important acts of his administration supplied his enemies with abundant proofs of malversation and treason. He was arrested on the 10th of June 1540, and committed to prison. The letters that he wrote to the king praying for mercy were disregarded, though the king read them thrice over: he was accused on the 17th of June in the House of Lords, which sent the bill of attainder down to the House of Commons on the 19th. Here some objections were raised against the bill; but after a delay of ten days a new bill was framed by the Commons, which the Lords afterwards passed. This bill contained twelve articles of impeachment, accusing him, among other crimes, of being "the most false and corrupt traitor and deceiver that had been known in that reign," "of being a detestable heretic," and "of having acquired innumerable sums of money and treasure by oppression, bribery, and extortion." To these accusations he was not allowed to answer in court, for fear, as it may be supposed, that he would prove the king's orders, directions, or consent for doing many things of which he was accused. He was kept in close custody for six weeks, when any hope that he might have entertained of a reprieve was put an end to; the charms of Catherine Howard and the endeavours of the Duke of Norfolk and the Bishop of Winchester prevailed, and the king signed a warrant for his execution, which took place on Tower Hill on the 28th of July 1540. Thus fell this great minister, of whom, as indeed of most of his contemporaries, very opposite characters have been handed down to us by historians. His virtues are greatly magnified by the advocates of the Reformation, his vices by its opponents. It appears doubtful, from a speech that he made at his death, in which religion he died; but it is very probable that he was a Lutheran, and that he used the term Catholic Faith (which some have held was intentionally ambiguous in his speech and afterwards in Crammer's) in the Lutheran meaning of the term. Cromwell was no patriot: his own interest, elevation, and aggrandisement seem always to have been uppermost in his thoughts. He was ambitious, unscrupulous, rapacious, hypocritical, and suspicious. To counterbalance these evil qualities he had few virtues. He is said to have shown cruelty in the condemnation and execution of some heretics, but he could scarce have been without benevolence, for about 200 persons (Stow's 'Survey') were fed twice a day at his gate. He had a powerful understanding; a clear insight into political affairs; a very retentive memory; and his attention to business was frequent and assiduous. He was the promoter of many useful alterations in the laws, and especially in those respecting the church. These were his chief merits. In passing judgment upon him, the remembrance of the reckless tyrannical caprice of his master, of the rapidity of his own advancement, together with the licentiousness of the times, should enhance the value of his merits, and temper our condemnation of his crimes.

(Foxe, *Acts and Monuments*; Stow, *Annals*; Strype, *Memorials*; Lord Herbert, and other *Histories of England*; Burnet, *Reform.*; Collier, *Ecclesias. Hist.*; everything which can be alleged or suggested unfavourable to Cromwell will be found in Lingard.)

CROTCH, WILLIAM, Doctor of Music, was born in 1775, in the city of Norwich. While yet a child, he exhibited faculties of musical perception and execution which were quite marvellous, and rival those of Mozart. An account of his precocious talents was given by Dr. Burney, author of the 'History of Music,' and is printed in the 'Philosophical Transactions' for 1779, when the infant prodigy was only four years of age. Some anecdotes are also extant, written by the Hon. Daines Barrington, who says, "I first heard little Crotch on the 10th of December 1778, when he was only three years and a half old." The following notices are extracted from the memoranda which he made on returning home: "Plays 'God save the King' and 'Minuet de la Cour' almost throughout with chords; reaches a sixth with his little finger; cries 'no,' when I purposely introduced a wrong note; delights in chords and running notes for the bass; plays for ten minutes extemporary passages, which have a tolerable connection with each other; seldom looks at the harpsichord, and yet generally hits the right intervals, though distant from each other. His father is an ingenious carpenter of Norwich, and had made an organ. His organ rather of a hard touch. Many of his passages hazy and angular, some of which he executed by his knuckles, tumbling his hands over the keys. The accuracy of this child's ear is such that he not only pronounces immediately what note is struck, but in what key the music is composed."

As Crotch advanced in years he became a profound theorist and a skilful composer. In 1797, at the early age of twenty-two, he was appointed Professor of Music in the University of Oxford, and the university also conferred on him the degree of Doctor of Music. In 1822 he was appointed Principal of the Royal Academy of Music.

He performed in public for the last time in 1831 in Westminster Abbey, during the royal festival, when he presided at the organ on the third day. Dr. Crotch composed a very large number of pieces for the organ and pianoforte, the opera of 'Palatine,' and some pleasing vocal pieces, among which may be mentioned the fine ode for five voices, 'Mona on Snowdon calls.' He also published 'Elements of Musical Composition and Thorough-Bass,' 1812, and 'Specimens of various Styles of Music of all Ages,' 3 vols.

Dr. Crotch, during the latter years of his life, resided at Taunton, Somersetshire, with his son, the Rev. W. R. Crotch, master of the free grammar-school. He died December 29, 1847, when sitting at the dinner-table.

CROWNE, JOHN, an industrious play-writer, of the time of Charles II., was the son of an Independent preacher in Nova Scotia. Coming to England, and serving an old lady for some time as gentleman-usher, he next became an author by profession. He had the equivocal honour of being brought forward by the Earl of Rochester, as a dramatic rival of Dryden; and, even after he had been cast off by his capricious patron, he retained the court favour he had gained. His satires on the Whigs, especially in one of his comedies, were about to be rewarded by a post or pension, when he was disappointed by the king's death. The latter part of his life is very obscure; but he is believed to have died soon after 1703. He left in print seventeen plays. The tragedies, rhymed and bombastic, are among the worst specimens of the corrupt taste which then ruled in the drama. In the construction of the plots they and his comedies are alike perplexed and undramatic. But the comedies are his best works, and have some merit in their portraiture of characters. His two tragedies entitled 'The Destruction of Jerusalem' were highly popular when first represented; and his comedy of 'Sir Courtly Nice,' translated or imitated by him from the Spanish by desire of Charles II., was oftener than once reprinted.

CROZIER, CAPTAIN FRANCIS RAWDON MOIRA, second in command of the ill-fated Franklin expedition, was born at Banbridge, county Down, Ireland. He entered the navy in June 1810, and, under the command of Sir Thomas Staines, he sailed in the 'Briton' to the Pacific, and visited Pitcairn's Island, which was found peopled by the descendants of the mutineers of the 'Bounty.' In 1824 he was appointed master's-mate of the 'Fury,' and he accompanied Parry in three of his voyages to the Polar Sea.

In 1826 Mr. Crozier was made lieutenant, and was employed on the coasts of Spain and Portugal till December 1835, when he sailed with Captain (now Sir) James Ross, to search for the missing whalers in Baffin's Bay. His reputation for science, seamanship, and fertility of resource, secured his promotion; and he commanded the 'Terror' in the expedition under Sir J. Ross for the exploration of the antarctic regions, which sailed in 1839, and was absent three years. In March 1845 he was re-commissioned to the 'Terror,' and sailed with Franklin to discover the north-west passage: since which time he has not been heard of. He was in the prime of life on his departure, and died probably in his fiftieth year. He was a Fellow of the Royal and Astronomical societies, and was distinguished as much for devotion to duty as for love of science.

* CRUIKSHANK, GEORGE, was born in London about 1795. From his father, who was an artist of some standing, he acquired the principles of design, probably also of caricature, as the elder Cruikshank occasionally practised in that line. But George was not brought up to follow his father's profession, and it was some time before he hit upon his right vocation: he is even said to have thought seriously of adopting the theatrical calling, and for a while to have trod the stage. His earliest designs were made for publishers of cheap song and children's books; but his satiric vein soon came to the surface, and in the 'Scourge,' and one or two other periodicals, he early showed his proficiency that way. Having become acquainted with Mr. William Hone, he found for some time abundant occupation in making designs for the political and other publications of that gentleman. The Queen's trial in particular afforded him ample matter. One work, the 'Queen's Matrimonial Ladder,' for which he furnished the cuts, so caught the public fancy that it quickly ran through some fifty editions. 'Non Mi Ricordo,' the 'Political House that Jack Built,' the 'Political Showman,' and 'A Slap at Slop, or the Bridge-Street Gang,' had nearly equal success. But he soon began to tire of personal and political caricature, and after Mr. Hone ceased to publish works of that kind (about 1823-24), Mr. Cruikshank we believe did not, with very rare exceptions, make any more political designs. He now turned to the illustration of humorous tales, and the delineation of passing follies. Great as had been his success in his former field, it was more than equalled in this. There was a keenness of observation, a spirit and variety of expression, and a genuine humour—in a word, an unmistakable comic genius visible in these thoroughly original designs, which every one felt to be irresistible. It may fairly be doubted whether more hearty fun was ever embodied in designs than appeared in those which flowed with marvellous rapidity from Mr. Cruikshank's pencil between the years 1824-40. Before the first of these years he had been designing with great skill, but somewhat coarsely, a variety of aquatint plates for such works as 'Tom and Jerry' and 'Life in Paris'; about the last-named year he sailed into the sentimental latitudes, and spoiled his style by giving up his time to etching a series of coarse

plates for 'Jack Sheppard' and the 'Tower of London.' Among the many admirable designs which belong to the intermediate period may be mentioned—the 'Points of Humour,' the exquisite illustrations to 'Peter Schlemihl,' and Grimm's 'German Tales,' the rough but excellent sketches for Hone's 'Every-Day Book,' 'Tom Thumb,' 'Three Courses and a Dessert,' and the 'Comic Almanac,' which he sustained with undiminished ability for some dozen years; 'My Sketch-Book,' 'Illustrations of Phrenology,' 'Illustrations of the Novelists,' and the illustrations to 'Boz' and 'Oliver Twist.' Many of these were etched by Mr. Cruikshank himself with a great mastery over the needle, while some of those engraved on wood are among the best examples in their way of the wood-engraver's art.

After Mr. Cruikshank had tired of the dreary horrors of the Jack Sheppard school, he returned with all his old power to his former style. But he now began to aspire to be a moral teacher, and in the 'Bottle,' a series of eight plates, he illustrated, with as much earnestness of purpose as Hogarth, the evils of gin-drinking. These plates, of for him an unusually large size, were published at a very low price, and had an enormous circulation. Their sale was zealously promoted by the temperance societies, and made the subjects of popular addresses and lectures. Mr. Cruikshank himself joined the teetotallers, and for some years past he has given up a large portion of his time and energy to the furtherance of the cause of total abstinence from intoxicating drinks. He is one of the most frequent and effective speakers at public meetings, and he enjoys among the members of the society a remarkable amount of well-earned popularity.

During the last few years Mr. Cruikshank has chiefly occupied himself professionally with painting in oil. Among the pictures he has exhibited may be mentioned his 'Tam O'Shanter,' 'Dressing for the Day,' 'Titania and Bottom the Weaver,' 'A Runaway Knock,' 'Cinderella,' and 'Disturbing the Congregation,' the last of which was purchased by Prince Albert, and has been recently engraved. All of these paintings show considerable humour and artistic skill, but they will never win such hearty admirers as his inimitable little etchings and wood-cuts.

*CRUSENSTOLPE, MAGNUS JAKOB, a Swedish political and miscellaneous writer, was born at Jönköping March 11th, 1795. His grandfather, who had been ennobled by King Adolphus Frederic and raised to a judicial post, was degraded and reduced to the bar in 1773 by Gustavus III., on account of his political opinions, which were adverse to the 'regal revolution,' as it has been called, which had been effected by that monarch. The grandson pursued for some time a legal career, but was compelled to resign the office he held in 1834, and has since supported himself on the profits of his literary works, and of a prize in the lottery which he was fortunate enough to win in 1837. For one of his works, 'Ställningar och Förhållanden' ('Positions and Relations'), which contained a series of anecdotes and observations reflecting on the government, he was tried in 1838, and condemned to three years' imprisonment in the fortress of Wäxholm. His condemnation gave rise to a series of riots, which led to loss of life. While undergoing his imprisonment, he composed his most popular work, 'Morianen,' which, in the form of a romance, comprises in fact an embellished history of the house of Holstein-Gottorp on the throne of Sweden. Another of his works, 'Carl Johan och Srenskaerne' ('Charles John and the Swedes'), presents a picture of the times of Bernadotte, extremely entertaining to read, but in which the reader is continually at a loss to know how much is fact and how much fiction. Another, the 'Historical Picture of the First Years of Gustavus IV.,' is more satisfactory in this respect, as avowedly and entirely historical; its materials are chiefly taken from the manuscripts of the Tessin library, which Crusenstolpe had purchased. A list of the whole of his works, which are numerous, is given in Palmblad's 'Biographical Lexicon.'

CRUSIUS, CHRISTIAN AUGUST, a philosophical writer, who enjoyed a great but transient reputation in the beginning of the last century. He was born in 1712 at Leuna, in Merseburg, and died in 1776, first professor of theology at Leipzig. His design was a reconciliation of philosophy with the orthodox theology. Considering the Wolfian philosophy the great enemy of religion, he made that the chief object of his attack. He was successful in exposing several of the dogmatical assertions of his opponents, particularly what are technically called the ontological and cosmological demonstrations of the being of a God. Unfortunately however he set up a system even more dogmatical than the one which he attempted to subvert, and he had the mortification to outlive the reputation which he had acquired.

CRUZ, JUANA INES DE LA, the most celebrated poetess whom Mexico has hitherto produced, and well known in Spain by the name of 'the Nun of Mexico,' was born about twelve leagues from that city, at St. Miguel de Nepantla, on the 12th of November 1651, and early displayed an ardent love for knowledge. At five years of age she could read and write, cypher, and sew; and soon after, when she was told there was a university at Mexico, she begged her father, Don Pedro de Asbaje, a Spaniard, to allow her to put on boy's clothes and go there. When she was afterwards taken to live in that city, she learned the Latin language in twenty lessons, and became such a proficient as to be able to write and speak it with fluency. She was appointed one of the ladies in attendance on the Marchioness of Mancera, the wife of the viceroy of Mexico; and on one occasion, when

she was seventeen, the marquis invited to an evening party forty of the most learned men in Mexico, professors of mathematics, &c., and brought her into conversation with them all. "Just as a royal galloon would defend itself from an attack of boats," so the viceroy more than once told her biographer Calleja, "did she disembarass herself of all the questions and arguments they could propose to her, each in his own particular branch." It was at this age that she resolved to become a nun; and though favoured by nature, and repeatedly besought in marriage, the principal objection that she felt to taking the veil was a doubt whether it would be allowable in a nun to occupy herself with books so much as she felt inclined to do. She lived twenty-seven years in the convent of St. Jerome at Mexico, and died on the 17th of April 1695 of the plague, leaving behind her a library of 4000 volumes. Her works, of which six editions had appeared in Spain before 1700 (and as many have been published since), extend to three quarto volumes, and comprise a number of plays, most of them on sacred subjects, but two of less serious character—one on the story of 'Theseus and Ariadne,' the other, 'Los Empeños de una Casa,' a comedy of the usual character of Spanish comedies, with the scene laid at Madrid. Mrs. Hale, in her 'Woman's Record' (New York, 1853), gives some pretty and spirited verses, translated from the Nun of Mexico, directed against the unjust depreciation of her sex. She was commonly called 'the Tenth Muse,' and the same title was bestowed on the other American poetess, her contemporary, Anne Bradstreet, of New England, who died in 1672, aged sixty, but whose poems were published in 1642, nine years before Ines de la Cruz was born.

CSOKONAI, MIHALY VITÉZ, an eminent Hungarian poet, was born at Debreczin, on the 17th of November 1773, and educated at the college there, where Joseph Kovács, who had published a very poor translation of the 'Æneid,' was at that time professor of poetry. Kovács, who was in the habit of making all the pupils write verses, whether they showed any talent for it or not, was surprised to find one of them who at once surpassed himself, and was accustomed to boast in after life that he had developed the talents of Csokonai. At the age of twenty, the young poet, who was by that time well acquainted with most of the leading literary men of Hungary, was himself elected to the professorship. At the age of twenty-two he was expelled for irregularities, of which it appears he was accused with too much justice. The rest of his life was mainly a struggle with poverty and ill-fortune, though his genius occasionally procured him powerful patrons. His last chance of retrieval appears to have been lost, when a lady of Presburg, whom he had celebrated under the name of Lilla, and who at one time appears to have favoured his suit, bestowed her hand on his rival, a merchant. After various wanderings to Pesth and Presburg, he died at Debreczin on the 23th of January 1805, in the house of his mother, who, early left a widow, had fostered his infant taste for reading, and now survived to superintend the publication of some of his poems. His reputation has risen higher since his death. There are several editions of his works, but by far the best and completest is that by Schedel, which was issued between 1844 and 1847, and forms part of the 'Nemzeti Könyvtár,' or 'National Library,' a collection of the Hungarian classics issued under the superintendence of the Kisfaludy Society. It contains selections from his correspondence, and is accompanied by an excellent 'Life' from the pen of Schedel, from which the above particulars are taken. Csokonai's productions, which are mostly of a comic and lively cast, comprise a series of love-poems to Lilla, three plays of a farical character, and a burlesque epic entitled 'Dorottya,' the name of the heroine. Schedel has judiciously omitted to reprint some poems, which Csokonai ought never to have written.

CSOMA DE KÖRÖS, ALEXANDER, is the form of name assumed in his published works, all of which are in English, by a scholar of Hungarian or rather of Transylvanian birth, whose name in his own language is written Körösi Csoma Sandor. He was born not long before 1790 at Körös in the district of Transylvania, inhabited by the race called Szeklers, supposed by many to be descendants of the ancient Huns. His parents, though of noble birth, were extremely poor, and their son received his education gratuitously at the college of Nagy-Enyed, the main support of which we are informed by Paget, the English traveller, is derived from a subscription raised some time ago in England, the proceeds of which, still lodged in the Bank of England, are sufficient to afford the college at the present day a revenue of 1000*l.* a year. There has always been among the Hungarians a great curiosity to learn from what country their ancestors originally came. That they were of Asiatic origin is generally admitted, rumours have been often current that tribes had been found in the Russian possessions in Asia speaking a language akin to the Magyar, which is common to the greater part of Hungary and Transylvania, and among others Klaproth, the Chinese scholar, has brought forward various grounds for believing that the Asiatic nation called by Arabian mediæval writers the Uigurs, must have been the same as the Magyars with a slightly altered name. These investigations and speculations took a strong hold of the fancy of the young Csoma de Körös. He often talked of them when a boy, and when he was about eighteen he told two of his school companions that he meant to travel across Asia to seek out the country of their ancestors. As he grew older however he ceased to say much on the subject, probably from finding

that it exposed him to ridicule, and it was supposed that he had dropped his intention. In 1815 he went to Göttingen ostensibly to study medicine, but in reality his chief view was to acquire a sufficient knowledge of oriental languages to qualify him for his purposes of travel. It was in 1820, when he was upwards of thirty years of age, that he set out on his pilgrimage. His friend Hegedus, one of the professors at Enyed, was surprised to hear from him one evening when he walked into his room lightly clad and with a little stick in his hand, as if about to set out on a country walk, that he came to take his leave, as he meant to start for the East to-morrow. He had received from his friend Michael Kenderesy, one of the few who encouraged him, a contribution of 100 florins (about 10*l.*), and a promise of another 100 yearly, and on this and the produce of his medical skill he meant to rely for subsistence.

The friends had an animated conversation that evening, and the next morning Hegedus, who relates these particulars in an obituary notice which he wrote of Csoma, accompanied him part of his way, and followed him with his eyes to the banks of the Maros. He never saw him more. Almost the next news that the Transylvanians had of Csoma was in a letter from Teheran, dated the 21st of December 1820, addressed to the patrons of the college of Enyed. In this he mentioned that instead of going direct to Asia, he had, after crossing the Balkan and visiting Constantinople, embarked for Alexandria, probably to consult the Arabic libraries at Cairo, and traversing Egypt and Syria, concluded the first year of his travels at Teheran. He was at the time of writing the letter sanguine of finding the object of his search, a nation speaking Hungarian, at no great distance of either time or place, and thought he should be home in about a twelvemonth. Years went by after this and nothing was heard of him, and then a flying rumour came from India that some great Hungarian scholar was studying Tibetan in one of the monasteries of Tibet. At Teheran, where Csoma was very kindly assisted by the English envoy Sir Henry Willock, he appears, on hearing five or six words of Tibetan, to have been struck with their resemblance to Magyar, and to have resolved to master the language. Taciturn in his habits, and peculiarly averse to speaking of himself, he never gave even his friends any but the most general account of the years he spent in Tibet. It is only known that he wandered across Little Bueharia to the desert of Gobi, that partly with Moorcroft, the English traveller, who died before his return, and partly alone, he traversed many of the valleys of the Himalaya, and that he spent four years from 1827 to 1830 in the Buddhist monastery of Kanam, deeply engaged in the study of Tibetan. For four months of this time he never stirred out of a room nine feet square, in which he remained without fuel, with the temperature below the zero of Fahrenheit, studying from morning till night the Buddhist sacred books. He had written down 40,000 Tibetan words, when, in 1830, he left the mountains to carry his stores of learning to Calcutta, and there a discovery awaited him which he afterwards declared occasioned him the bitterest moments in his life. He had soon found that there was no real resemblance between Tibetan and Magyar, but he prosecuted the study in the hope that the literature of the language would throw some light on the early history of the nation of which he was in quest, and now learned from the scholars of Calcutta that the literature of Tibet consisted of translations from the Sanscrit, a language which he might have studied with ease at home. The disappointment was so bitter that it threw him on a bed of sickness, but there were consolations in store for him. His studies in the Buddhist monasteries had made him well acquainted with the literature of the Buddhist religion, to which Hodgson and Turnour were then beginning to call attention, and on this subject Csoma became an oracle.

The library of the Asiatic Society of Bengal contained eleven hundred volumes in Tibetan, which no one had hitherto been able to catalogue. Csoma not only undertook the task, but when he was paid for it, remarked that he should have been willing to pay if he had been a rich man for the pleasure of making the catalogue. The singular disinterestedness of his character, the frugality of his habits and their eccentricity, his strange costume, which was always the long warm blue cloak of Transylvania under an Indian sun, all made him a noted personage in Indian society, which however he shunned instead of courting. The Indian scholars, especially Prinsep and Wilson, treated him with marked generosity and kindness; he was provided with apartments at the library of the Asiatic Society, and for some time officiated as librarian; his articles in English on subjects of Tibetan literature were revised by Professor Wilson and published in the journal of the Society, or in the 'Asiatic Researches,' and he was engaged at the government expense to prepare a Tibetan grammar and dictionary. From the Indian journals his fame travelled homewards, and the Transylvanians were delighted to hear that their long-missing countryman was now a celebrated scholar on the banks of the Ganges. The Transylvanian diet voted him a sum of about 140*l.* for his support; but Csoma, who received it with extreme gratification as a token of his country's approval, had already more money than he knew how to employ, and handed this over to Prinsep to purchase Indian books and manuscripts to be presented to native seats of learning on his return. He continued for some years at or about Calcutta, diligently employed in the study of Sanscrit and other languages, avoiding the society of Europeans, and for some

time making only excursions of no great moment. In 1842 he prepared for a final expedition to accomplish the great object of his life. He was at that time convinced that the land of the Uigurs was to be found to the east and north of Lassa, the capital of Eastern Tibet, and on the western confines of China. On the 26th of March 1842, he arrived at Darjeeling on his way to Sikkim in Tibet, and Dr. Campbell, the superintendent at that station, sent the vakeel of the rajah of Sikkim to visit him, to convince himself that the rajah might permit him to enter the country without danger. "The vakeel," says Dr. Campbell, "who is a man of intelligence and some learning, was altogether annoyed at finding a Feringhee a complete master of the colloquial language of Tibet, and so much his own superior in acquaintance with the religion and literature of that country." While Csoma awaited at Darjeeling a reply to his application to the rajah, he was seized with illness, refused to take medicine, grew rapidly worse, and on the 11th of April expired without a groan or struggle.

The news of his death was received with great regret throughout India and Europe, and more especially in his native country. The celebrated Hungarian novelist Eötvös, the author of the 'Village Notary,' the English translation of which was so successful a few years ago, pronounced a funeral oration on him in October 1843, at a meeting of the Hungarian Academy, of which in his absence Csoma had been elected a member. It is from this oration that our particulars respecting his Hungarian life have been taken, those relating to his career in India are chiefly derived from the Indian journals. There is one passage in Eötvös which an Englishman can hardly deny himself the gratification of giving at length.

"Proudly and majestically stands the British nation among the nations of Europe; the five parts of the globe acknowledge its power, and its banner floats in command of the ocean; but it is not this which constitutes the highest glory of Albion—which inspires every thinking man with involuntary reverence at the mention of its name. The constancy with which it contends for the triumphs of mind; the victories it has won in the field of humanity and science; the kindred feeling which every great thought, every lofty sentiment, the just esteem which all true merit like that of Körösi excites in the English nation,—this it is which identifies its existence with civilisation, its supremacy with the supremacy of all that is high and noble; which makes its name great and glorious among the nations of the earth. It is to the English nation that we stand indebted, after God, for the glory that redounds to us from what was effected by Körösi. In Teheran, Willock; in Tibet, Moorcroft; in Calcutta, Prinsep; in Darjeeling, Campbell—always and everywhere it was Englishmen who aided our countryman with their advice and their benefits: who, recognising his merits, did heartily for him what his country could not do, or had failed to do, for her illustrious son; and if by the Tibetan Grammar and Dictionary he redeemed his obligations, and could receive without a blush the benefits of strangers, I yet discharge a sacred duty when, in the name of this Academy, in the name of every admirer of Körösi, in the name of the country at large, I publicly return our thanks to the most glorious nation of this earth for the sympathy and assistance which our countryman received at the hands both of its individual citizens and of its government."

The original purpose of Csoma's travels to the East was not attained. His example, however, has had imitators. Castrén [CASTREN], who travelled to Russia in search of the dialects of Finnish, was, in fact, on the same quest as Csoma, as Finnish and Hungarian are certainly connected, though the degree of their connection, like that of the Tartar languages in general, is a fruitful subject of discussion. But in searching for one thing, the Transylvanian traveller found another. He was not so unfortunate as he imagined in having devoted himself to the study of Tibetan; for, in doing so, he stumbled on a new field. In Remusat's 'Récherches sur les langues Tatars,' published in 1820, but which Csoma had not seen till he saw it at Calcutta, the most unsatisfactory chapter is that on Tibetan, in which he successfully demonstrates that all written on the subject by Fourmont and Georgi is a mass of blunders, but is unable to point out what is to be substituted. The Dictionary of the Bhotanta language (another name for Tibetan), published by Marshman at Serampore in 1826, from an Italian manuscript, is described as worthless by Schmidt of St. Petersburg and Fougoux of Paris, the two great living authorities on the subject of Tibetan, who, on the contrary, unite in declaring that Csoma had completely entered into the spirit of the language; that his Dictionary is a standard work, and that if they have succeeded in clearing up some points even more than he did, it is to his guidance that they owe their proficiency. The title of the work is characteristic, 'Essay towards a Dictionary Tibetan and English: prepared with the assistance of Bandé Sange, Rgyas Phun-Tshoge, a learned Lama of Zangkar, by Alexander Csoma de Körösi, Siculo-Hungarian of Transylvania, during a residence at Kanam, in the Himalaya Mountains, on the confines of India and Tibet, 1827-30.' It was published in one volume quarto at Calcutta, in 1834, and the Grammar followed in the same year. The articles on Tibetan literature by the author in the Journal of the Asiatic Society of Bengal are numerous; and his analysis of the Kah-Gyur, the principal sacred book of the Buddhist religion, is printed in the twentieth volume of the 'Asiatic Researches.' In the preface to his

Dictionary, he insinuates that he had discovered a striking connection between Sanscrit and Hungarian; but his views on this subject are not generally regarded as sound. In the course of his travels and researches, Ctesias had altogether studied seventeen or eighteen languages, in several of which he was a proficient. His English is the English of a foreigner.

CTESIAS, the son of Ctesiochus, was a Greek physician and historian, who flourished about the end of the fifth century B.C. He belonged to an Asclepiad house at Cnidos, but spent seventeen years of his life at the court of Artaxerxes Mnemon. (Diodor. ii. 32.) We gather from Tzetzes (Chil. i. 1, 82), that he was taken prisoner at the battle of Cynaxa (401 B.C.), and Diodorus says that he was raised from the situation of a captive to his post of royal physician; but it appears from Xenophon and Plutarch ('Anab.' i. 8, § 27; vit. 'Artaxerxes,' c. xi.) that he was one of Artaxerxes' immediate attendants at that battle, so that of course he could not have fallen into the hands of the Persians on that occasion. It is more probable that the great estimation in which Greek physicians were held in Persia, where they had, since the time of Democedes, completely superseded the Egyptian practitioners, induced Ctesias to follow the example of some of his countrymen, and betake himself to a country where his art was so much more appreciated and so much better rewarded than in Greece. Ctesias wrote—1, 'Persian History,' in twenty-three books, of which the first six treated of the Assyrian monarchy, and the remainder carried down the history of Persia to the year 398 B.C. (Diod. xiv. 46; and the end of the 'Persica' in Photius.) 2, 'Indian History,' in one book. 3, 'A Treatise on Mountains.' 4, 'A Description of Sea-coasts.' 5, 'On the Revenues of Asia.' 6, 'On Medicine.' We have many fragments of his historical writings, especially of the 'Persian History,' which are mainly preserved in the 'Myriobiblon' of Photius: there are also fragments in Diodorus, Elian, and other writers. Diodorus says (ii. 32) that he had access to the royal archives; but Aristotle, Plutarch, and Lucian, charge him in strong terms with inaccuracy and falsehood. Mr. Clinton thinks that Ctesias had no intention of misrepresenting, but that his materials were not trustworthy ('Fasti Hellenici,' ii. p. 308); and an elaborate justification of his general veracity has been attempted by Bähr, in the introduction to the best edition of the remains of this author which has yet appeared. Ctesias wrote mainly in the Ionic dialect.

CTESIBIUS, an Alexandrian Greek who lived about B.C. 150-120, the instructor of Hero (according to Pliny), and the inventor of various hydraulic and other machines, according to Pliny, Vitruvius, Philo of Byzantium, Athenæus, &c. This is all we know of Ctesibius except that he wrote various works, which are referred to by Vitruvius, and cited (esp. 1) with those of Archimedes, where mention is made of authors on physics. A manuscript of Geodesy is said to be in the Vatican, and another entitled 'Beloposica' in some English library (Heilbronner is authority for both, who cites Possevinus 'Bibl. Sel.', edit. Rom. c. 8, p. 201, and the catalogue of the Cambridge library (f)). There is a life of Ctesibius by Bernardino Baldi, Aug. Vend., 1614.

Besides a clepsydra of complex construction which is attributed to Ctesibius by Vitruvius, the remaining inventions attributed to him are the water organ, mentioned by Pliny and Vitruvius, a pump for raising water, described by the latter, and, according to Philo of Byzantium, a machine similar in principle to the air-gun. But all these contrivances are imperfectly described, excepting only the pump, which was like what we now call a forcing-pump. The water was raised by exhaustion into a cylinder with an entering and issuing valve: it entered by means of the former, and was expelled through the latter by the descent of the piston.

CTESIPHON, an Athenian, son of Leosthenes, of the deme Anaphlystus. He is known for a decree by which he proposed to present Demosthenes with a golden crown as a public acknowledgment of his services to the state. An accusation founded on this decree was brought against Ctesiphon by Æschines, who charged him with unconstitutional proceedings. Demosthenes replied in his celebrated oration 'On the Crown,' and Ctesiphon was acquitted. The attack and the defence are both extant. The case was tried B.C. 330. (Demosthenes, 'On the Crown,' §§ 243, 266; Clinton, 'Fast. Hel.'). [ÆSCHINES; DEMOSTHENES.]

CUBITT, THOMAS, was born in 1788, and was the son of a labouring man at Buxton, a village in Norfolk. Thrown early on his own resources, and denied the advantages of what is called a liberal education, he nevertheless rose into eminence by skill and industry combined with integrity, and amassed a large fortune by the improvements which he effected in the architecture and sanitary arrangement of London. His father died while he was still a youth. The trade to which he was brought up was that of a carpenter. He worked at the bench for some time, and then went out to India in the capacity of ship's carpenter. Having accumulated some small amount of money during his voyage out and home again, he became a master-carpenter and then a builder in Gray's-inn-road. He was here engaged to build the Metropolitan Institution in Finsbury-circus. About 1823 he contracted for the improvement of the property of the late Duke of Bedford in the neighbourhood of Russell and Tavistock squares, and a year or two later entered into a similar engagement with the late Marquis of Westminster and Mr. Lowndes for erecting mansions on

their property between Knightsbridge and Westminster. The skill with which he laid out and built what is now frequently called 'Belgravia,' recommended him to the late Mr. Kemp, who employed him to build Kemp Town at Brighton. He subsequently laid out and built Clapham Park, and Southern Belgravia, including Warwick and Eccleston squares at Piccadilly. Mr. Cubitt was one of the first persons to propose a comprehensive scheme of draining London by carrying the sewerage to a point in the river Thames considerably below the city. He was also the author of other sanitary plans for the prevention of nuisances from smoke, &c., and the appropriation of open spaces in the suburbs of London as parks for the people. When her Majesty and Prince Albert determined on rebuilding Osborne in the Isle of Wight, the work was entrusted to Mr. Cubitt. For several years Mr. Thomas Cubitt held the honorary post of examiner of candidates for district surveyorships, and at one time was president of the Builders' Society. Himself originally a working man, he felt and laboured for the working classes. Thus he erected a workman's library and school-room near his establishment at Thames Bank, and devised a plan for supplying their families with the comforts of life from his own premises. On one occasion, when his large works at Thames Bank were burnt down, thinking nothing of his own loss, he commenced at once a subscription for replacing the tools of his workmen. He died rather suddenly at Denbies, Surrey, December 26, 1855, having just finished his mansion there, and completed his contracts in Belgravia. His brother, Mr. Alderman William Cubitt, formerly his partner in Gray's-inn-road, was sheriff of London in 1847, and has represented Andover in parliament since that date.

CUBITT, SIR WILLIAM, of a different family to the subject of the preceding article, was born at Dilham in Norfolk in 1785. While still a youth he showed a decided talent for the construction of machinery. He was apprenticed to a joiner; and in 1807 made known his invention of the self-regulating sails for windmills, having previously commenced business as a millwright. Shortly after he became connected with the Messrs. Ransome of Ipswich, celebrated as agricultural instrument makers, but whose business is not confined to that branch of manufacture. Here Mr. Cubitt's talents as a general engineer were more fully developed. He constructed gas-works, and invented the tread-mill for prisons. In 1826 he settled in London as a civil engineer; and his reputation procured him immediate employment, while his ingenuity, industry, and success ensured its continuance. In 1827 an act was passed for the improvement of the Norwich and Lowestoft Navigation, and Mr. Cubitt was appointed engineer. The object was to open a navigation for sea-going vessels from Yarmouth or Lowestoft to Norwich. To effect this Mr. Cubitt united the river Yare with the Waveney, thence to the small lake of Oulton Broad, through Lake Lothing, with a passage onward to the sea, 700 yards long and 40 wide; Lake Lothing being thus formed into an artificial harbour, the tide-lock of which will admit vessels 84 feet long, and 21 feet in beam. This undertaking was completed in 1829. Among his subsequent employments, he designed the South Eastern Railway, including the removal of the South Down Cliff by blasting, which feat was accomplished under his superintendence. He was officially appointed, being then President of the Society of Civil Engineers, to exercise a superintending watchfulness over the construction of the building for the Great Exhibition of 1861 in Hyde Park; he received the honour of knighthood for thus contributing his scientific experience in carrying out that national undertaking.

CUDWORTH, RALPH, was born at Aller, in Somersetshire, in 1617. Having been entered at Emmanuel College, Cambridge, in 1630, when he was but thirteen, he commenced residence in 1632, and became in due course of time, as his father had been before him, a fellow of Emmanuel. He acted for some time as tutor in the college, and had among his pupils the afterwards celebrated Sir William Temple. He had taken the degree of M.A. in 1639; he took that of B.D. in 1644, maintaining upon this occasion the two following theses: 1. 'Dantur boni et mali rationes æternæ et indispensabiles.' 2. 'Dantur substantiæ incorporeæ suâ naturâ immortales.' In 1644 he was also appointed master of Clare Hall; and in the succeeding year was elected to the regius professorship of Hebrew. On receiving this appointment he devoted himself with zeal to the subject of Jewish antiquities. He took the degree of D.D. in 1651. Though holding the two situations which have been mentioned, and besides these the living of North Cadbury, in Somersetshire, worth 300*l.* a year, to which he had been presented by his college shortly after taking his Master's degree, he did not find his means sufficient for his support. It does not appear that he was a man extravagant in his habits; but owing, it is said, to pecuniary difficulties, he now absented himself for some time from Cambridge. He returned in 1654, having been chosen master of Christ's College. He now married, and the remainder of his life was spent in this college. In 1662 he was presented by the then Bishop of London to the vicarage of Ashwell, in Hertfordshire; and in 1678 he was installed prebendary of Gloucester. In this last-mentioned year appeared his great work, the 'True Intellectual System of the Universe;' or rather (for though complete in itself, it is but a fragment of a larger work which he designed), the first part of the 'Intellectual System.' This first part is devoted to the refutation of atheism. The whole work was to consist of three parts; but the second and third parts,

which were to treat respectively of the nature of moral distinctions and of free will, were, though written, never published by him. Dr. Birch, in the memoir prefixed to his edition of the 'Intellectual System,' having related the calumnious charges of atheism brought against Cudworth on the appearance of this work, goes on to quote the following remark of Warburton's:—"The silly calumny was believed; the much injured author grew disgusted; his ardour slackened; and the rest and far greatest part of the defence never appeared," (p. 22.) Though this does not necessarily imply that the remainder of the work was not written, the inference would not be a very forced one. Nor does Dr. Birch ever explicitly state that the second and third parts were written, contenting himself with the remark—"He left several posthumous works, most of which seem to be a continuation of his 'Intellectual System,' of which he had given the world only the first part," (p. 31.) A reference merely to Dr. Cudworth's preface, in which he makes a division of his subject, or to the beginning of his first chapter, would have shown that the treatise on Eternal and Immutable Morality, which has been published since his death is the second part, and the treatise on Liberty and Necessity, which is still in manuscript, is the third part of the work.

Dr. Cudworth died at Cambridge in 1688, in the seventy-first year of his age, and was buried in Christ's College. He left one daughter, who married Sir Francis Masham, and who is known, under the name of Lady Masham, as the friend of Locke.

Dr. Cudworth was one of that set of Cambridge divines known as Latitudinarians, on whom Bishop Burnet has passed a high eulogium in his history of the reign of Charles II. The chief others at this time were Drs. Whitchoot, Wilkins, Henry More, and Worthington. "Dr. Whitchoot," says Burnet, "set young students much on reading the ancient philosophers, chiefly Plato, Tully, and Plotin; and on considering the Christian religion as a doctrine sent from God, both to elevate and sweeten human nature, in which he was a great example, as well as wise and kind instructor. Cudworth carried this on with a great strength of genius and a vast compass of learning. He was a man of great conduct and prudence, upon which his enemies did very falsely accuse him of craft and dissimulation." ('Hist. of his own Time,' vol. i. p. 321.)

The 'Intellectual System,' or that (properly the first) part of it which now passes under the name, is directed, as has been said, against atheism. This is one of three, as Cudworth conceives, false systems or hypotheses of the universe, or one of three possible modes of fatalism. They are thus briefly described in the preface:—"Of the three fatalisms or false hypotheses of the universe mentioned in the beginning of this book, one is absolute Atheism, another immoral Theism, or religion without any natural justice and morality (all just and unjust, according to this hypothesis, being mere thetical or factitious things, made by arbitrary will and command only), the third and last, such a Theism as acknowledges not only a God or omnipotent understanding Being, but also natural justice and morality, founded in him, and derived from him; nevertheless, no liberty from necessity anywhere, and therefore no distributive or retributive justice in the world." Before erecting the true intellectual system of the universe (the epithet *intellectual* being used, as he tells us, "to distinguish it from the other, vulgarly so called, systems of the world, that is, the visible and corporeal world, the Ptolemaic, Tychoenic, and Copernican"), it was his object to demolish these false systems. And the first of them, Atheism, or the atheistic fate, is attempted to be demolished in the first part, which is all that we have under the name of Intellectual System. It is a work of great learning, and also of great acuteness. But grave charges have been founded upon this work. "There wanted not country clergymen," says Warburton, "to lead the cry and tell the world that, under pretence of defending revelation, he wrote in the very manner that an artful infidel might naturally be supposed to use in writing against it; . . . that with incredible industry and reading, he had rummaged all antiquity for atheistical arguments, which he neither knew how, nor intended, to answer; in a word, that he was an atheist in his heart, and an Arian in his book." ('Divine Legation of Moses,' vol. iii., ed. 1765: Preface.) The accusation alluded to in these passages is made in a circuitous way by a Mr. John Turner, in a 'Discourse of the Messiah.'

In attacking atheism, or the atheistic fate, Dr. Cudworth describes the atomic physiology which, as held by Democritus, and other ancient philosophers, involved atheism. It being his object to demolish atheism under every form, and therefore the atomic atheism, he yet adopts the atomic physiology, contending that "so far from being either the mother or nurse of atheism, or any ways favourable thereto (as is vulgarly supposed), it is indeed the most opposite to it of any, and the greatest defence against the same." For the better confutation of other forms of atheism, to which he gives the names Hylozoic and Cosmo-plastic, he makes the hypothesis of an "artificial, regular, and plastic nature," working in complete subordination to the Deity. And to avert an argument brought against the oneness of the Deity, from its unnaturalness as shown by the general prevalence of Polytheism among the Pagan nations, he contends that "the Pagan theologians all along acknowledged one sovereign and omnipotent Deity, from which all their other gods were generated or created," and that their Polytheism was but a polyonymy of one God.

The 'Treatise on Eternal and Immutable Morality' corresponds to

the second part of the 'Intellectual System.' It is directed against those who "affirm justice and injustice to be only by law and not by nature;" among which affirmers he places, erroneously in our opinion, Hobbes.

Besides the 'Intellectual System,' Dr. Cudworth published, 1, 'A Discourse concerning the true Notion of the Lord's Supper,' in which he maintains, as Warburton has since maintained, that the Lord's Supper is a feast upon a sacrifice; 2, a treatise, entitled 'The Union of Christ and the Church Shadowed, or in a Shadow;' 3, 'A Sermon on John ii. 3-4, preached in 1647 before the House of Commons on a Day of Public Humiliation;' 4, 'A Sermon preached in 1664 at Lincoln's Inn, on 1 Cor. xv. 57;' 5, a treatise, entitled 'Deus Justificator, or the Divine Goodness vindicated and cleared, against the assertors of absolute and inconditionate Reprobation.'

Dr. Cudworth left several works in manuscript, only one of which has yet been published, namely, the 'Treatise concerning Eternal and Immutable Morality,' which appeared with a preface by Dr. Chandler, bishop of Durham, in 1731. The rest are—1, 'A Discourse of Moral Good and Evil;' 2, 'A Discourse of Liberty and Necessity, in which the grounds of the Atheistical Philosophy are confuted, and Morality vindicated and explained;' 3, 'A Commentary on Daniel's Prophecy of the Seventy Weeks;' 4, 'Of the Verity of the Christian Religion against the Jews;' 5, 'A Discourse of the Creation of the World and Immortality of the Soul;' 6, 'A Treatise on Hebrew Learning;' 7, 'An Explanation of Hobbes's Notion of God, and of the Extension of Spirits.' These manuscripts, after having passed through many dangers, were finally purchased for the British Museum, in which institution they now are.

An abridgment of the 'Intellectual System' was published in 1706 by Mr. Wise, Fellow of Exeter College, Oxford, in 2 vols. 4to. In 1783 a Latin translation was published by Dr. Mosheim at Jena, in which the numerous errors in Cudworth's numerous quotations are corrected, and whose style is less complicated than that of the original; a French translation, which had been commenced by M. Bourdelin, a member of the French Academy, was prevented from being finished by the death of the translator. That part of the 'Intellectual System' which treats of the 'plastic nature' gave rise to a controversy between Mr. Bayle and M. Le Clerc; the former of whom contended that such an hypothesis went to show the possibility of Hylozoism, while the latter defended Cudworth by representing it as a mere instrument of the Deity. M. Le Clerc's articles, which are valuable commentaries on this part of Cudworth's work, are in the 'Bibliothèque Choisie,' tom. v., vi., vii., ix.

(Kippis, *Biographia Britannica*; Mosheim and Birch, *Lives*.)

CUJACIUS, CUJAS, JACQUES, was born at Toulouse in the year 1520. The day of his birth is unknown. His father, a tanner of Toulouse, was named Cujas, which the son changed into Cujas, for the purpose of making the name better suited for the latinized form of Cujacius. In the latter part of his life he often signed De Cujas. Cujas, at an early age, distinguished himself by his talents and assiduity, and is said to have learned Greek and Latin by himself without any teacher. He studied law at Toulouse under Arnold Ferrier, for whom he entertained a high respect all his life; but he acquired the best part of his extensive knowledge by his own industry. With unwearied labour he studied all the works of the best civilians, and exercised himself in discussions with his fellow-students. In 1547 he began to lecture on Justinian's Institutes with great applause, and soon acquired such a reputation that the most distinguished men of the country, as President Dufaur and John de Foix, sent their sons to Toulouse to study under Cujas. In 1554 a professorship of the Roman law being vacant in the University of Toulouse, Cujas was a candidate, but, by the intrigues of his enemies, a man of very moderate talents, Stephen Forcadet, was preferred. Shortly after, being invited to Cahors as professor of law, he removed there with the greater part of his pupils. In the following year Margaret de Valois, at the suggestion of the Chancellor l'Hôpital, invited Cujas, as professor of law, to the university of Bourges. At that time there were two celebrated lawyers in Bourges, Hugh Doneau (Donellus) and Francis Duanin (Duarenus), both of whom became the rivals and enemies of Cujas. This was particularly the case with Duanin, who excited the students against Cujas to such a degree that, as Cujas also had a party of his own among the students, great disturbances would have arisen if he had not left the place. Having removed to Paris he was invited by a deputation from the city of Valentia to accept a professorship in that university. Cujas accepted the invitation; but Duanin having died in the year 1559, he returned to Bourges, where he resided till 1566. In the meantime Margaret de Valois, his patroness, had married the Duke of Savoy, who gave Cujas an invitation as professor to the University of Turin. Not liking Italy, he returned to Valence as professor, and lived there till 1575, with some short interruptions, when he left on account of the religious quarrels which disturbed that city. During his residence in Valence the reputation of Cujas rose to its height. Young men from all parts of Europe, and especially from Germany, not only students of law but those who were devoted to other sciences, came to Valence to study under Cujas. Among his pupils was Joseph Scaliger, the most celebrated philologist of his time, and James Augustus de Thou (Thuanus), the French historian. Henri III. of France made Cujas councillor in

the parliament of Grenoble, and loaded him with honours. In 1575 Cujas returned to Bourges as professor; but to avoid the religious troubles he again left Bourges for a year, during which he lectured on the civil law at Paris. Returning to Bourges he resided there till his death, having refused an invitation from Pope Gregory XIII., as professor in the university of Bologna.

The latter years of his life were greatly troubled by the religious disturbances which then distracted France. On the death of Henri III. the party of the Cardinal de Bourbon made great promises to Cujas, if he would write in favour of the cardinal against the rights of Henri IV. Cujas refused the proposals, and the fanatics of Bourges being excited against him by his enemies, he nearly lost his life in a tumult. On the 4th of October 1590 Cujas died of grief, as it is said, for the wretched situation of his country, in which civil war had dissolved all social order. Both friends and enemies united in honouring him with a splendid funeral.

Cujas was twice married. He had a son of great talents, who died in 1681; and a daughter by his second marriage, who was notorious for her disorderly life.

Cujas was distinguished both as a teacher and a writer. His merits principally consisted in substituting a more rational system in place of the unscientific method of Bartolus, and in grounding his interpretation of the civil law on a profound study of the original authors, and of the manuscripts of the Roman law. He possessed in his own library 500 manuscripts on the Roman law. His knowledge of archaeology also and his exact acquaintance with the ancient languages gave him a decided superiority over other civilians. In teaching as well as in his writings he followed the exegetical method, in which he may still be considered as a model.

The works of Cujas are very numerous. They are commonly divided into 'Opera Priora,' which were published in his life by himself: first at Paris, 1577, 5 vols. fol., and again in 1683; and 'Opera Posthuma,' which were edited by his friends after his death. Both the 'Opera Priora' and 'Posthuma' were first collected and edited by Alexander Scot, Lyon, 1614. The most complete edition is that by Fabrot, Paris, 1658, 10 vols. fol. As it is very difficult to find what we want in the works of Cujas, the 'Promptuarium Operum Jacobi Cujaci; auctore Dom. Albinensi,' Naples, 1763, 2 vols. fol., is of great assistance.

The works of Cujas consist: 1, of editions of the original works on the civil law, principally of the 'Codex Theodosianus,' 'Pauli receptæ sententiæ,' 'Justinian's Institutes,' of the three latter books of the 'Codex Justinianus,' of the 'Consuetudines Feudorum,' with notes, and a translation of the sixtieth book of the 'Basilika,' of which he also published an edition; 2, of commentaries, notes, and interpretations relating to most parts of the Institutes, Pandects, Code, and Novels; a 'Commentary on the Decretals,' and Lectures on many passages of the Pandects; 3, other important works, as his 'Observationum et Emendationum libri xviii,' a work which civilians in the time of Cujas called 'opus incomparabile et divinum.' It contains corrections of the original works on law and of a great number of other authors, both Greek and Latin. This work is a real treasure to philologists; 4, 'Paratitla ad Digesta, et in libros ix. Codicis,' which is a summary of the titles of the Pandects and the Constitutions of the Code.

(*Éloge de Cujas*, par Bernardi, Lyon, 1775; *Histoire de Cujas*, par Berriot; Saint Prix, *History of the Roman Law*, which is the best biography of Cujas; *Ed. Spangenberg*; *Cujas und seine Zeitgenossen*, Leipzig, 1822.)

CULLEN, WILLIAM, was born in Lanarkshire, in the year 1712. His parents being in humble circumstances, he commenced the study and even the practice of physic under certain disadvantages; and after serving an apprenticeship to a surgeon-apothecary in Glasgow, he became surgeon to a merchant vessel, trading between London and the West Indies. He soon returned to his own district, and practised in the country parish of Shotts, a region proverbial, even in Scotland, for bleakness and poverty. But having been introduced to the Duke of Argyll, who was on a visit to a gentleman in the neighbourhood, he acquired his good opinion; and was led soon after to remove to Hamilton. There he was admitted a councillor in 1737, and was chief magistrate in 1739 and 1740; and he formed a partnership with a young man destined to attain equal celebrity, William Hunter. The chief object of this connection was to enable them to improve their medical education; and accordingly they agreed that one of them should alternately be allowed to study during the winter at some medical school, while the other should carry on the business in the country for the profit of both parties. Cullen took the first turn, and passed his winter at Edinburgh. Hunter, when his turn arrived, went to London, where he soon recommended himself to Dr. Douglas, a lecturer on anatomy and midwifery, who engaged him as an assistant. Thus ensued a premature dissolution of partnership; for Cullen threw no obstacles in the way of his friend's advancement, but readily cancelled the articles. They maintained ever after a cordial communication by letters, though it does not appear that they again met.

The Duke of Hamilton having been suddenly taken ill at his palace, sent for Cullen, who not only benefited him by his skill, but attracted him by his conversation. It appears to have been the interest of this nobleman which procured him the situation of lecturer of chemistry

in the University of Glasgow; and having previously taken his Doctor's degree, he began his first course in 1746. His medical practice daily increased; and when a vacancy occurred in 1751, he was appointed by the king to the professorship of medicine. It was now that he began to show the rare talent of giving science an attractive form, diffusing clearness over abstract subjects, and making the most difficult points accessible to ordinary capacities.

In 1756 he was called to Edinburgh to fill the chair of chemistry, vacated by the death of Dr. Plummer. While holding this office, he for several years delivered clinical lectures at the royal infirmary. Alston, the professor of materia medica, died in 1763, and was succeeded by Cullen, who, though now in the middle of his chemical course, began his new subject a few days after his nomination. So great was his popularity, that while only eight or ten pupils had entered under Alston, he attracted above a hundred. On the death of Dr. Whytt, in 1766, Cullen took the chair of theoretical medicine, resigning that of chemistry to his pupil Black. The chair of practical medicine next became vacant by the death of Dr. Rutherford. Gregory started as a rival candidate to Cullen; but by an amicable compromise it was agreed that the chairs of theoretical and practical medicine should be shared between them, each lecturing on both subjects; but when Gregory was suddenly cut off in the prime of life, Cullen occupied the practical professorship alone, till within a few months of his death. As a lecturer, Dr. Cullen, like all who have excelled in that difficult branch of the profession, carried with him not merely the regard but the enthusiasm of his pupils. Alibert bears testimony to the impression he made upon the foreign students who resorted to his lectures, and who preserved indelible recollections of his power to convince and to awaken. He lectured from short notes and this nearly extemporaneous delivery no doubt contributed to that warmth and variety of style which tradition ascribes to his lectures, but which are certainly not the characteristics of his published works. Cullen died on the 5th of February 1790. The following is a list of Dr. Cullen's works: 1. 'First Lines of the Practice of Physic,' Edin., 1777, 4 vols., 8vo. This work has been frequently reprinted, and has been translated into French, German, Italian, and Latin. Dr. Cullen's system, as delivered in this book and in his lectures, superseded that of Boerhaave, of which the humoral pathology forms a part. Cullen's division of diseases into four classes is so simple, and yet so ingenious that it is still adopted by some English lecturers. The first class contains the Pyrexia, or febrile diseases; the second, the Neuroses, or nervous diseases; the third, the Cachexia, or diseases of an ill habit of body; the fourth, the Locales, or local diseases. To give an example of each, pleurisy belongs to the first class, epilepsy to the second, scurvy to the third, and tumours to the fourth. [BROWN, JOHN, M.D.] 2. 'Institutions of Medicine,' Edin., 1777, 12mo. This is a treatise on physiology, which was translated into French, German, and Latin. 3. 'An Essay on the Cold produced by evaporating Fluids, and of some other means of producing Cold,' Edin., 1777. This is annexed to Dr. Black's Experiments upon Magnesia alba, &c. 4. 'A Letter to Lord Cathcart, president of the Board of Police in Scotland, concerning the Recovery of Persons drowned and seemingly dead,' Edin., 1784, 8vo. 5. 'Synopsis Nosologiae Methodica,' Edin., 1785, 2 vols., 8vo. The first volume contains the nosologies of Sauvages, Linnæus, Vogel, Sagar, and Macbride; the second contains Cullen's own, which is by far the best. This work was translated into German, with some additions, Leipzig, 1786, 2 vols., 8vo. 6. 'A Treatise of the Materia Medica,' Edin., 1789, 2 vols., 4to. Translated into French and Italian, and twice into German; one of the German translations is by Hahnemann, Leipzig, 1790, 2 vols., 8vo. Cullen's clinical lectures were published in 1797, Lond., 8vo. Dr. Young ('Med. Liter.'), after the title of the book, puts the word surreptitious, so that it was probably printed from the note-book of some student.

CUMBERLAND, RICHARD, was born in the parish of St. Ann, near Aldersgate, in London, on the 13th of July 1682. He received the early part of his education at St. Paul's School, and went thence to Magdalen College, Cambridge, in 1649. After taking his Master's degree he thought of entering the medical profession, and accordingly studied medicine for a short time; but he soon relinquished this intention, and took orders. In 1658 he was appointed to the rectory of Brampton, in Northamptonshire, where he remained till 1667, when Sir Orlando Bridgman, who had been his contemporary at Cambridge, and had now become lord keeper, first made him his chaplain, and shortly afterwards bestowed on him the living of Allhallows, in Stamford. In both places he performed the duties of minister with the most exemplary assiduity. In Stamford he regularly preached three times every Sunday, having taken upon himself a weekly lectureship in addition to his parochial duties. His 'Inquiry into the Laws of Nature,' which was written while he was chaplain to Sir Orlando Bridgman, appeared in 1672, the year in which Puffendorf published his 'Treatise on the Law of Nature and Nations.' His 'Essay on Jewish Weights and Measures,' a work of great learning and acuteness, was published in 1686.

After the Revolution, Dr. Cumberland was raised to the see of Peterborough, in the room of Dr. Thomas White, who refused the new oath. The manner of his appointment was highly honourable to him, and not less to King William. "The king was told," says Mr. Payne, his chaplain, to whom we are indebted for a brief, and that the

only, memoir of Cumberland, "that Dr. Cumberland was the fittest man he could nominate to the bishopric of Peterborough. . . . The doctor walked after his usual manner on a post-day to the coffee-house, and read in the newspaper that one Dr. Cumberland, of Stamford, was named to the bishopric of Peterborough; a greater surprise to himself than to anybody else." (Preface to Sanchoniathon's 'History,' p. xii.) This was in the sixtieth year of his age; but his health was still good, and he entered with great zeal on the performance of his new duties. He had commenced, some years before, a critical examination of Sanchoniathon's 'Phœnician History;' and this work still occupied him for some years after he was made a bishop. It led him to several cognate inquiries, the results of which were published some time after his death under the title of 'Origines Antiquissimæ, or Attempts for Discovering the Times of the first Planting of Nations.' Neither was the series of dissertations on Sanchoniathon's History published during his lifetime. They were both edited by Mr. Payne, and published, the latter in 1720, the former in 1724. At the age of eighty-three Dr. Cumberland, having been presented by Dr. Wilkins, with a copy of his Coptic Testament, then just published, commenced, like another Cato, the study of Coptic. "At this age," says Mr. Payne, "he mastered the language, and went through great part of this version, and would often give me excellent hints and remarks as he proceeded in reading of it." He died on the 9th of October 1718, in the eighty-seventh year of his age.

Dr. Cumberland's private character appears to have been a perfect model of virtue. He was a man also of most extensive learning. "He was thoroughly acquainted with all the branches of philosophy: he had good judgment in physics, knew everything that was curious in anatomy, had an intimacy with the classics. Indeed he was a stranger to no part of learning, but every subject he had occasion to talk of, he was as much a master of it as if the direction of his studies had chiefly lain that way. He was thoroughly conversant in Scripture, and had laid up that treasure in his mind. No hard passage ever occurred, either occasionally or in reading, but he could readily give the meaning of it, and the several interpretations, without needing to consult his books."

The 'Inquiry into the Laws of Nations' ('De Legibus Naturæ Disquisitio Philosophica, in qua eorum forma, summa capita, ordo, promulgatio, et obligatio, e rerum naturæ investigantur; quinque Elementa Philosophiæ Hobbianæ, cum morali tum civili, considerantur et refutantur') was called forth by the political and moral works of Hobbes. Hobbes is charged therein with atheism; he is represented, as he is also represented in Cudworth's 'Eternal and Immutable Morality,' as denying any standard of moral good and evil other than one fashioned by human law; he is upbraided for the forms of expression that in a state of nature all men have a right to all things, and that the state of nature is a state of war. These differences between Hobbes and Cumberland may be all traced to a misapprehension of the former's meaning. As regards Cumberland's own views of moral science, they are substantially correct. Objections may be made to the phrases, 'law of nature' and 'right reason,' by which last he denotes the set of faculties employed in the determination of moral good and evil. But though in a science where the chief disputes that have arisen are verbal disputes, phraseology cannot be accounted unimportant; and though that phraseology, combined with clumsiness of style and arrangement, has prevented a general perception of the substantial merits of the work, we must, while we regret the defect and its consequences, do justice to a really correct system. Tendency to effect the general good is made the standard of morality. To endeavour to effect the greatest amount of general good is the one great duty, or the one great 'law of nature;' and we know, according to Cumberland, that it is a duty or law of nature, or law of God, because we know that an individual derives the greatest happiness from the exercise of benevolence, and that God desires the greatest possible happiness of all his creatures. Carrying out the fundamental principle, that the greatest general good is to be sought, he deduces the several particular duties or particular 'laws of nature.' He founds government upon, and tests it by, the same principle.

The 'Inquiry,' as may be inferred from the Latin title which has been given, was written in Latin. It was printed in a most inaccurate way, and the innumerable errors of the original edition have been perpetuated in the several German and London reprints. Dr. Cumberland left an interleaved copy with a few corrections and additions; in this same copy the whole text was revised by Dr. Bentley; and thus enriched, the copy was presented to the library of Trinity College, Cambridge, by Richard Cumberland, the great-grandson of the bishop, and grandson of Dr. Bentley. An abridged translation was published by Mr. James Tyndal in 1791, during Dr. Cumberland's lifetime. Mr. Maxwell, an Irish clergyman, published a translation in 1727, prefixing and appending some original dissertations. M. Barbeyrac published a translation into French in 1744, having been allowed the use of the interleaved copy containing the author's and Dr. Bentley's corrections. A third English translation by the Rev. John Towers, D.D., appeared in 1750.

(Payne's Preface to Cumberland's Sanchoniathon's History; Kippin, *Biographia Britannica*.)

CUMBERLAND, RICHARD, a dramatic writer and miscellaneous author of the last century, great-grandson of Richard Cumberland,

bishop of Peterborough, and grandson by the mother's side of Dr. Richard Bentley, was born February 19, 1732, in the lodge of Trinity College, Cambridge. He was placed successively at the public schools of Bury St. Edmunds and Westminster, and at the early age of fourteen commenced his residence at Trinity College, Cambridge. Though during his two first years he had entirely neglected his mathematical studies, he distinguished himself highly by readiness and skill as a disputant in the schools, and obtained the degree of tenth wrangler. Two years after he was elected Fellow of Trinity. It was his intention to enter the church, and devote himself to literature and the duties of his profession. From these views he was withdrawn by being appointed in the same year private secretary to the Earl of Halifax, then first lord of trade, whom he accompanied, on his appointment to be lord-lieutenant, to Ireland in 1760. Through this connection his father became bishop first of Clonfert, afterwards of Kilmore. After passing through one or two subordinate offices, Cumberland was appointed secretary to the Board of Trade, soon after Lord George Germaine became first lord in 1775, and held that office until the suppression of the board in 1782. In 1780 he was sent on a confidential and secret mission to the court of Madrid. This appointment proved the source of no small loss and vexation, in consequence of his expenditure to the extent of 4500*l.* beyond the money which he received at starting, of which no portion ever was repaid. On this subject we have only his own *ac parte*, but uncontradicted, statement: there is every appearance that he was exceedingly ill-used.

After the reduction of the Board of Trade, Cumberland received a compensation-allowance, and retired to husband his diminished means at Tunbridge Wells. He now devoted himself altogether to literature, which had hitherto been only his amusement; and tried his powers in the multifarious departments of opera, farce, comedy, tragedy; occasional, lyric, and sacred poetry; pamphlets, novels, essays, and even divinity; but he will hardly be remembered except as an essayist, and as the author of several successful comedies, of which only the 'West Indian,' the 'Wheel of Fortune,' and the 'Jew,' need be mentioned. The 'West Indian' obtained great popularity on its first appearance, and is still a stock piece. The 'Jew' was an honourable attempt to combat popular prejudice against the Jewish nation. The 'Wheel of Fortune' is identified with John Kemble, who made Penruddock one of his very effective characters. Many other of his dramatic pieces, of which there are at least thirty-two, were popular at the time of their production; and even those which had little sterling merit added for a time to his reputation, by keeping his name continually before the public.

As an essayist, Cumberland rode to fame on the shoulders of Bentley, from whose manuscripts he derived the learning of those series of papers in the 'Observer' on Greek poetry, which contain a rich collection of translated fragments of the comic poets. The merits of the translations however belong to Cumberland. There are also a number of valuable critical essays, chiefly on the drama. The entire work proceeded from Cumberland's pen, and affords honourable evidence of the author's fertility of imagination, knowledge, humour, and varied power of composition. His translation of the 'Clouds of Aristophanes' is elegant, but he has altogether missed the spirit of the original.

One of Cumberland's pamphlets that appeared without his name, entitled 'Curtius rescued from the Gulph, or the Reply Courteous to the Rev. Dr. Parr, in answer to his learned pamphlet, entitled "A Sequel,"' &c., is no unfavourable specimen of the author's powers of humour and sarcasm, and his readiness at paying off a mass of learned quotations in coin of the same but a more current kind.

His memoirs, published in 1806, is a very amusing book, full of interesting anecdotes of the men of his time, which will give the reader a thorough insight into the vain and irritable character of the author. His reputation was unblemished in the discharge both of his public and private duties, and his society was much courted for his brilliant conversation. Mr. Cumberland died, after a few days' illness, May 7, 1811.

CUMMING, JOHN, D.D., a native of Aberdeenshire, Scotland, was born in 1810, and after completing his literary and theological studies with a view to the Christian ministry in connection with the established Church of Scotland, he accepted an engagement as a tutor in a school near London. Having been licensed as a probationer by the presbytery of London, he became in 1832 minister of the Scotch church in Crown-court, Covent-Garden, the duties of which office he still discharges with well-sustained efficiency and acceptance. Dr. Cumming has distinguished himself as a popular preacher, an acute and skillful controversialist, and a diligent and successful author. As secretary of the Protestant Reformation Society he has been frequently called to take part in the public agitation of the questions in dispute between Roman Catholics and Protestants, and has on several occasions held public discussions with adherents of the Roman Catholic Church. As a friend of establishments, he has defended the propriety of the connection between church and state against the arguments of the friends of the voluntary principle; as attached to the Church of Scotland, he has been the principal representative in London of those who resisted the anti-patronage, non-intrusion, and Free-church movements; and in questions of church polity he has generally been associated with the adherents of the moderate party in the Scottish

establishment. Dr. Cumming's published works are numerous, including three volumes of discourses on the Book of Revelations, Daily Bible Readings, and a variety of practical and devotional religious works. Of the peculiar views developed in many of these works the reader is left to form his own opinions. One of his published sermons, entitled 'Salvation,' was preached by command before the Queen in the parish church of Crathie, when her Majesty was residing at Balmoral.

CUNEGO, DOMENICO, a distinguished Italian engraver, and one of the best of the 18th century, was born at Verona in 1727. He commenced to study as a painter under Francesco Ferrari, but he found engraving more suited to his taste, and at the age of eighteen he adopted it as his profession. Being a correct draftsman, he was enabled himself to make, from the pictures he engraved, the drawings from which he worked. Cunego settled in Rome in 1761, where his first works were a series of Roman ruins after Clérissieu, for the Count Girolamo dal Pozzo. In 1773 Gavin Hamilton published his 'Schola Italica,' of which the best and the greater part of the plates were engraved by Cunego. He engraved twenty-two, including the three creations—of the water, of the sun and the moon, and of Adam, from the frescoes of Michel Angelo on the ceiling of the Sistine Chapel; 'La Fornarina' of Raffaele, from the Barberini portrait; and 'Galatea,' from the fresco of Raffaele in the Farnesina. The others are from Giorgione, Titian, the Caracci, Domenichino, Guido, and other celebrated painters.

In 1785 Cunego was invited to Berlin to superintend an Engraving Institute (Kupferstich-Institute), which was established by a merchant of the name of Pascal; but after a trial of four years the undertaking was abandoned, and Cunego returned in 1789 to Rome. He however executed a great many plates, chiefly portraits, during his sojourn in Berlin, including several mezzotint and line portraits of Frederic II. and the royal family of Prussia, after K. F. Cunningham, a Scotch painter, then in repute at Berlin. Besides the works already mentioned, Cunego engraved eleven mythological subjects after Gavin Hamilton, and numerous other works, religious and profane, after various masters. He engraved also an outline of the great fresco of the 'Last Judgment' by Michel Angelo, in the Sistine Chapel. He died at Rome in 1794. Cunego's execution, as far as respects the mere line, was not the most perfect; but his style was light, elegant, and correct; and he was perhaps the best historical engraver in Italy of his immediate time, until he was surpassed in his later years by his junior and rival Volpato. His two sons, Aloisi and Giuseppe, likewise practised engraving with success.

(Gandellini, *Notizie storiche degli Intagliatori*, &c.; Huber, *Manuel des Amateurs*, &c.; Göthe, *Winckelmann und sein Jahrhundert*; Ticozzi, *Dizionario degli Architetti*, &c.)

CUNITZ, MARIA, born at Schweidnitz, in Silesia, about the beginning of the 17th century. She was remarkable, according to report, for the great variety of her knowledge, but the only published specimen is her 'Urania Propitia, sive Tabule Astronomicæ,' &c., printed at Oels in 1660, and at Frankfurt in 1661. This work was composed in a Polish convent, the civil troubles having driven the authoress from her country. It is an attempt to simplify the methods derived from Kepler's laws, and in particular to avoid the use of logarithms; more remarkable from the circumstance of the writer being a female than from any particular merit.

The principal instructor of Maria Cunitz in astronomy was a countryman of her own named Loewen, whom she married on the death of her father. The preface and dedication of the tables were written by him. She died at Pitschen in Silesia, probably after 1669.

(Delambre, *Astron. Moderne*; Lalande, *Bibliog. Astron.* The latter cites Desvignoles, *Bibl. Germ.*, vol. iii, and Scheibel, *Bibl. Astron.*, pp. 361-378.)

CUNNINGHAM, JOHN, the son of a Scotchman settled in Dublin as a wine-merchant, was born there in 1729. An ill-judged passion for the stage tempted him away from home at an early age. His father afterwards became insolvent; and a pride not discreditable to him forbade him to return and be a burden on his family. Accordingly he continued during his short life to pursue the precarious career of an itinerant player. For a good many of his later years he was chiefly employed at Edinburgh and in the north of England, where his personal character was highly respected. He was the author of a farce now quite unknown, and of several small volumes of poetry, chiefly pastoral, whose sweetness has obtained for some of them a corner in popular collections, and entitles their author to a place in the list of minor English poets.

CUNNINGHAM, ALLAN, was born at Blackwood in Dumfriesshire, in 1785, of parents in humble circumstances, though not of humble descent, as one of his ancestors lost the family patrimony in Ayrshire by taking the side of Montrose in the time of the Commonwealth. "His father," says Allan Cunningham, "was a man fond of collecting all that was characteristic of his country;" an inquiry which the son appears to have prosecuted, if not with more zeal, at least with more effect. Young Allan was taken away from school at the early age of eleven, and was bound to a stonemason. Hogg gives us some account of Allan's appearance and character in early life in his 'Reminiscences of Former Days.' He describes him at the age of eighteen as "a dark ungainly youth, with a broadly frame for his age, and strongly-marked manly features, the very model of Burns, and

exactly such a man." Hogg continues, that young as Allan Cunningham then was, he had heard of the name, and he thought he had seen one or two of his juvenile pieces.

In 1810 he came to London, and his name first appeared in print at the same time, as a contributor in the collection of Cromek's 'Remains of Nithsdale and Galloway Song.' This collection, purporting to be the Nithsdale and Galloway relics, was entirely recast and much of it written by Allan Cunningham; and Hogg states that when he first saw the book he perceived at once the strains of Allan Cunningham, especially in the 'Mermaid of Galloway,' from the peculiarity of his style, which he had already noticed, and he adds that "Allan Cunningham was the author of all that was beautiful in the work."

For some time after his arrival in London, Allan Cunningham maintained himself by reporting for newspapers, and contributing to periodicals, especially the 'London Magazine,' to which he was one of the principal supports. At a later period, the situation which he obtained in Chantrey's studio, as foreman or principal assistant in working the marble, and for many years the confidential manager of his extensive statuary establishment, enabled him to prosecute his literary taste without hazard. The following are his chief works:—'Sir Marmaduke Maxwell,' a drama; 'Paul Jones' and 'Sir Michael Scott,' novels; 'Songs of Scotland, ancient and modern, with Introduction and Notes, Historical and Critical, and Characters of the Lyric Poets,' 4 vols. 8vo, 1825; 'The Lives of the most eminent British Painters, Sculptors, and Architects,' in Murray's 'Family Library,' 6 vols. 12mo, 1829-33; the Literary Illustrations to Major's 'Cabinet Gallery of Pictures,' 1833-34; 'The Maid of Elvar,' a poem; 'Lord Roldan,' a romance; 'The Life of Burns,' and 'The Life of Sir David Wilkie,' 3 vols. 8vo, 1843, a posthumous publication. Allan Cunningham died on the 5th of November 1842, aged fifty-seven.

Allan Cunningham was highly valued by his literary contemporaries, and especially so by Sir Walter Scott. Hogg, after recounting his first meeting with him, says, "I never missed an opportunity of meeting with Allan when it was in my power to do so. I was astonished at the luxuriousness of his fancy. It was boundless; but it was the luxury of a rich garden overrun with rampant weeds. He was likewise then a great mannerist in expression, and no man could mistake his verses for those of any other man. I remember seeing some imitations of Ossian by him, which I thought exceedingly good; and it struck me that that style of composition was peculiarly fitted for his vast and fervent imagination." His "style of poetry is greatly changed of late for the better. I have never seen any style improved so much. It is free of all that crudeness and mannerism that once marked it so decidedly. He is now uniformly lively, serious, descriptive, or pathetic, as he changes his subject; but formerly he jumbled all these together, as in a boiling cauldron, and when once he began it was impossible to calculate where or when he was going to end."

Allan Cunningham's 'Lives of the Painters' was a very popular work. It contains memoirs of Hogarth, Wilson, Reynolds, Gainsborough, West, Barry, Blake, Opie, Morland, Bird, Fuseli, Jamesone, Ramsay, Romney, Runciman, Copley, Mortimer, Raeburn, Hoppner, Owen, Harlow, Bonington, Cosway, Allan, Northcote, Sir G. Beaumont, Lawrence, Jackson, Livermege, and James Burnet, painters; of Gibbons, Cibber, Roubiliac, Wilton, Banks, Nollekens, Bacon, Mrs. Damer, and Flaxman, sculptors; and of William of Wykeham, Inigo Jones, Wren, Vanbrugh, Gibbs, Kent, Earl of Burlington, and Sir W. Chambers, architects. It is written in an easy, fluent, and forcible style. The less satisfactory lives are those of West, Blake, Bird, Fuseli, Jamesone, Cosway, Northcote, Wilton, and Bacon; in some of these there is the occasional appearance of a spirit of critical severity, remarkable in a man of great kindness of disposition.

*CUNNINGHAM, PETER, the eldest son of Allan Cunningham, was born in Pimlico, April 7, 1816. He was educated at a private school, and when only eighteen years of age he entered the public service as a junior clerk in the Audit Office, a situation bestowed upon him by Sir Robert Peel as a tribute to the merits of his father. The duties of his office were so efficiently fulfilled as to occasion his promotion in 1854 to one of the chief clerkships. Mr. P. Cunningham commenced his literary career before entering office by the publication in 1833 of 'The Life of Drummond of Hawthornden.' This was followed in 1836 by 'Songs of England and Scotland,' in 2 vols.; and in 1841 by a new edition of Campbell's 'Specimens of the British Poets,' with additions, in 1 vol. In 1849 his 'Handbook of London' was published, in 2 vols.; and a second edition with additions and corrections, in 1 vol., in 1850. This work, though condensed in its descriptions, is fuller of valuable information founded upon extensive research than many works far more voluminous. But, at the same time, it is not a dry catalogue of places and persons; it abounds in brief but valuable anecdotes that illustrate political and literary history, and present curious pictures of manners. For these we are always referred to authorities, with precise dates. No topographical work was ever compiled with greater care. Mr. Cunningham has also edited, for Mr. Murray's 'Library of British Classics,' the 'Works of Oliver Goldsmith,' in 4 vols., 1854; and 'Johnson's Lives of the Poets,' with additional lives, in 3 vols., 1854.

Mr. Cunningham has, in addition to being a contributor to many periodical works—'Fraser's Magazine,' 'Household Words,' the 'Athenæum,' the 'Illustrated News,' &c. &c.—written the following

works:—'The Handbook to Westminster Abbey,' 1842; 'The Life of Inigo Jones,' published by the Shakspere Society in 1848; 'Modern London,' 1851; 'Prefatory Memoir of J. M. W. Turner,' prefixed to John Burnet's 'Turner and his Works,' 1852; and 'The Story of Nell Gwynn,' 1852.

CURRIE, JAMES, M.D., was born 31st of May 1756, at Kirkpatrick-Fleming, in Dumfriesshire, of which parish his father was clergyman. Being originally intended for a mercantile life, as soon as he had received the rudiments of a liberal education he went to Virginia; but upon the breaking out of the American war in 1776 he returned home, and soon after commenced the study of medicine at the University of Edinburgh. Having completed the usual course, he took his degree of M.D. at Glasgow in 1780, and immediately proceeded to London. His intention was to go out to Jamaica, but a sudden attack of illness preventing him from sailing after he had taken his passage, he settled and began to practise in Liverpool in 1781. Here he soon met with great success in his profession. His first publication was a biographical memoir of a deceased friend, which was printed in the 'Transactions of the Manchester Philosophical and Literary Society' for 1785. In 1790 a paper on tetanus and convulsive disorders, which he communicated to the third volume of the 'Memoirs of the London Medical Society,' considerably extended his professional reputation. In 1792 he was elected a Fellow of the Royal Society. In 1798 he published a pamphlet against the policy of the war with France, under the title of 'A Letter, Commercial and Political, addressed to the Right Hon. William Pitt, by Jasper Wilson, Esq.,' which attracted a good deal of attention. In 1797 appeared the work on which his professional reputation principally rests, entitled 'Medical Reports on the Effects of Water, cold and warm, as a remedy in Febrile Diseases.' The method of treatment here recommended by Dr. Currie, affusion in cold water in cases of fever, though a remedy not to be trusted except to the most skilful hands, has since been applied in suitable circumstances with extraordinary success. A second volume of the 'Reports' appeared in 1804, and the author was preparing a new edition of the whole work when he died. The name of Dr. Currie is best known to general readers by his edition of the works of Robert Burns, including both his Poems and Letters, which he published for the benefit of the poet's family, in 4 vols. 8vo, in 1800. It was introduced by a criticism on the writings of Burns, and 'Some Observations on the character and condition of the Scottish Peasantry,' both of which papers were drawn up with much elegance and ability. This edition has formed the basis of every succeeding collection of the poet's works. In 1804 Dr. Currie felt his health rapidly giving way; and leaving Liverpool, he spent some time in Bath and Clifton. In March 1805 he considered himself to be so far restored, that he took a house and commenced practising in Bath; but his illness soon returned, and he died at Sidmouth on the 31st of August in the same year.

CUVIER, GEORGES-CHRETIEN-LEOPOLD-DAGOBERT, BARON, was born 23rd of August 1769, at Montbéliard, now in the department of Doubs, but which at that time was a county belonging to the dukes of Wurtemberg. His father, a half-pay officer of a Swiss regiment in the French service, had married late in life a young and accomplished woman, who took especial care of Cuvier's early education. He was sent to study first at Tübingen, and he afterwards entered the Academia Carolina, then newly-established at Stuttgart by Prince Charles of Wurtemberg for the purpose of training up young men for public and diplomatic offices. Cuvier however bestowed most of his time on natural history; he collected specimens, and drew and coloured insects, birds, and plants during his hours of recreation. The limited circumstances of his family obliged him to remove from Stuttgart before he obtained any public employment; and at twenty-one years of age he accepted the situation of tutor to the only son of Count d'Hericy in Normandy. The family residence being near the sea, the study of marine animals became a part of Cuvier's occupation. He compared the living species with the fossil remains found in the neighbourhood; and the dissection of a species of cuttle-fish led him to study the anatomy of the mollusca, and to reduce to order this hitherto neglected branch of zoology. While he was thus employed, a society was formed at Valmont, in his neighbourhood, for the encouragement of agriculture. L'Abbé Teissier, a venerable and learned old man, the author of the articles on agriculture in the 'Encyclopédie Méthodique,' had taken refuge at Valmont from the revolution, disguising his obnoxious character of Abbé under the garb and profession of a surgeon. At a meeting of the new society he expressed his opinions on his favourite subject in a manner which forcibly reminded young Cuvier of the articles which he had read in the 'Encyclopédie.' At the end of the sitting Cuvier addressed the stranger by the name of L'Abbé Teissier: the abbé was alarmed, but Cuvier soon removed his apprehensions, and an intimacy was formed between them.

When the reign of terror had ceased, Teissier wrote to Jussieu and other friends at Paris in terms of high commendation of his new acquaintance. The result was that Cuvier was requested to forward some of his papers to the Society of Natural History, and shortly after, in 1796, being then twenty-six years of age, he went to Paris, and in the same year was appointed assistant to Mertrud in the superintendence of the Jardin des Plantes, which locality became from that time

his home, and the scene of his labours and of his fame. Here he began the creation of that now splendid collection of comparative anatomy, and in December of the same year he opened his first course on that branch of science. In 1796 the National Institute was formed, and Cuvier was one of its first members. In 1798 he published his 'Tableau Élémentaire de l'Histoire Naturelle des Animaux,' and afterwards his 'Mémoire sur les Ossements Fossiles des Quadrupèdes,' and 'Mémoire sur les Ossements Fossiles qui se trouvent dans les Gypses de Montmartre.' He continued to illustrate the subject of fossil remains by subsequent memoirs. In the year 1800 he was named professor of natural philosophy at the College de France, continuing at the same time his lectures on comparative anatomy at the Jardin des Plantes. In that year were published the first two volumes of his 'Leçons d'Anatomie Comparée,' which met with the greatest success. The three following volumes appeared in 1805. In 1802 the First Consul Bonaparte appointed Cuvier one of the six inspectors-general for establishing lycées, or public schools, which were supported by the government, in thirty towns of France. Cuvier established those of Marseille, Nice, and Bordeaux. He was about the same time appointed perpetual secretary to the Institute for the Department of Natural Sciences, with a salary of 6000 francs. In 1803 he married the widow of M. Duvancel, a former fermier-général: four children whom he had by this marriage all died before him. In 1808 he was commissioned by Napoleon to write a report on the progress of the natural sciences from the year 1789. The luminous and interesting treatise which he produced on this occasion was formally presented to Napoleon in the council of state. Cuvier declares the true object of science to be, "to lead the mind of man towards its noble destination—a knowledge of truth; to spread sound and wholesome ideas among the lowest classes of the people; to draw human beings from the empire of prejudices and passions; to make reason the arbitrator and supreme guide of public opinion." His next appointment was that of counsellor for life of the new Imperial University, in which capacity he had frequent personal intercourse with Napoleon. In 1809-10 he was charged with the organisation of the new academies, the name designed to be given to the old universities of the Italian states which were annexed to the empire. He organised those of Piedmont, Genoa, and Tuscany. His reports of these missions exhibit the mild and enlightened spirit which he brought to the task. In 1811 he was sent on a similar mission to Holland and the Hanseatic towns: his report especially concerning Holland is very interesting, as the subject of public instruction in that country is not generally known. He paid particular attention not only to the higher branches of education, but also to popular or elementary instruction: his principle was, that instruction would lead to civilisation, and civilisation to morality, and therefore that primary or elementary instruction should give to the people every means of fully exercising their industry without disgusting them with their condition; that secondary instruction, such as in the lycées, should expand the mind, without rendering it false or presumptuous; and that special or scientific instruction should give to France magistrates, physicians, advocates, generals, clergymen, professors, and other men of learning.

In 1813 Cuvier was sent to Rome, then annexed to the French empire, to organise the universities there. Although his being a Protestant rendered this mission the more delicate, yet his enlightened tolerance and benignity of manner gained him the general esteem and approbation in the capital of the Catholic world. Soon after Napoleon appointed him *maitre-des-requêtes* to the council of state, and in 1814, just before his abdication, he named him councillor of state, an appointment which was confirmed by Louis XVIII., who soon after appointed him chancellor of the university, an office which he held till his death.

Cuvier published in 1817 a second edition of the 'Recherches sur les Ossements Fossiles,' in 5 vols. 8vo, and also his 'Règne Animal,' in 4 vols., in which the whole subject-matter of zoology, beginning with man, is arranged according to the principle of organisation. In 1818 he made a journey to England, where he was received with appropriate honour. In the same year he was elected a member of the French Academy. In 1819 he was appointed president of the committee of the interior in the council of state, an office which, fortunately for him, was beyond the sphere of political intrigues, and only required order, impartiality, and an exact knowledge of the laws and principles of the administration. In the same year Louis XVIII., as a personal mark of his regard, created him a baron. He was appointed also temporary grand master of the university, an office however which he willingly resigned for that of grand master of the Faculties of Protestant Theology in 1822. He himself stipulated that he should receive no salary for this latter office. He was made at the same time one of the vice-presidents of the Bible Society. Through his care fifty new Protestant cures were created in France. He also established new professorships of history, living languages, and natural history, in the minor schools of the kingdom. In 1825 he republished, separately, the preliminary discourse to the 'Recherches sur les Ossements Fossiles,' which is generally known by the title of 'Discours sur les Révolutions de la Surface du Globe,' and has been translated into most European languages under the title of 'Theory of the Earth.' This work is a series of deductions from actual facts, authenticated by his own researches into the fossil remains, classed according to the strata in which they were found. Cuvier draws the following conclusions: 1st.

That in the strata called primitive there are no remains of life or organised existence. 2nd. That all organised existences were not created at the same time, but at different times, probably very remote from each other—vegetables before animals, the mollusca and fishes before reptiles, and the latter before the mammalia. The transition-limestone exhibits the remains of the lowest forms of existence; the chalk and clay conceal the remains of fishes, reptiles, and quadrupeds, the beings of a former order of things which have now disappeared. 3rd. That among fossil remains no vestige appears of man or his works, no bones of monkeys are found, no specimen of the whole tribe of quadrumanous animals. 4th. That the fossil remains in the more recent strata are those which approach nearest to the present type of the corresponding living species. 5th. That the stratified layers which form the crust of the globe are divisible into two classes, one formed by fresh water and the other formed in the waters of the sea; a fact which leads to the conclusion that several parts of the globe have been alternately covered by the sea and by fresh water. From these and other facts Cuvier concludes that the actual order of things on the surface of our globe did not commence at a very remote time: he agrees with Deluc and Dolomieu, that the surface of the earth was subject to a great and sudden revolution not longer than five or six thousand years ago, and that this catastrophe caused the disappearance of countries formerly the abode of man and of species of animals now unknown to us; but he also believes that the countries now inhabited had been at some former period, long before the creation of man, inhabited by land animals, which were destroyed by some previous convulsion, and that this globe has undergone two or three such visitations, which destroyed as many orders of animals, of which we find the remains in the various strata. In many respects this work has been left in arrears by the rapid advances of scientific research and deduction, but it has not been superseded; and it will remain a noble monument to its author's extraordinary attainments and great mental power.

In 1826 Charles X. bestowed on Cuvier the decoration of grand officer of the legion of honour; and the king of Wurtemberg, his former sovereign, made him commander of his order of the crown. In 1827, Cuvier, as a member of the cabinet of the interior, was intrusted with the superintendence of all affairs concerning the different religions professed in France, except the Catholic. In the same year he had the misfortune to lose his only remaining child, a daughter, amiable and accomplished, and on the eve of her marriage; a loss from which he never entirely recovered. In 1828 appeared the first volume of his '*Histoire Naturelle des Poissons*,' a splendid work, of which however he lived to see only the first eight volumes published. It contains more than 5000 species of fishes, described from real specimens and classed, with observations on their anatomy, and critical researches on their nomenclature, ancient as well as modern.

In 1830 Cuvier opened a course in the Collège de France on the history and progress of science, and especially of the natural sciences, in all ages. In the same year he paid a second visit to England, and it was during his absence from Paris that the revolution of July took place. On his return he was graciously received by the new king Louis Philippe, who in 1832 made him a peer of France. On the 8th of May of that year he opened the third and concluding part of his course of lectures on the history of science, by summing up all that he had previously said; he then pointed out what remained for him to say respecting this earth and its changes, and announced his intention of unfolding his own manner of viewing the present state of creation. This discourse, delivered in a calm solemn manner, produced a deep impression on his hearers, which was increased when he added the concluding words—"These will be the objects of our future investigations, if time, health, and strength shall be given to me to continue and finish them with you." That was his last lecture. The following day he fell ill, and soon after paralysis manifested itself. He saw the approach of death with resignation, and he expired on the 13th of May 1832, at the age of sixty-three. He was buried in the cemetery of Père-la-Chaise: his funeral was attended by deputations from the Council of State, the several academies, by members of the two Chambers, &c.

The career of this great and good man, passed quietly, but most usefully, in the pursuits of science, and in instructing and benefiting mankind, during forty years the most eventful in the history of France and of Europe, forms a striking contrast with that of the conquerors and politicians who agitated the world during the same period. His works, of which we have mentioned a few of the most important, are very numerous, and even a mere catalogue of them would exceed our limits. The reader will find a full list of them in chronological order in the very interesting 'Memoir' by Mrs. R. Lee, named below. Besides his scientific works, Cuvier wrote numerous éloges, among others, of Brugnieres, Daubenton, Lemonnier, Priestley, Adanson, Saussure, Bonnet, Fourcroy, Pallas, Rumford, Werner, Sir Joseph Banks, Delatour, Berthollet, Lacépède, Fabbioni, Ramond, Sir Humphry Davy, &c. These éloges, which are really interesting biographies, have been published in 3 vols. 8vo. He also contributed to the '*Dictionnaire des Sciences Médicales*,' the '*Biographie Universelle*,' and to the '*Dictionnaire des Sciences Naturelles*.'

(Mrs. R. Lee, *Memoir of Baron Cuvier*; Duvernoy, *Notice Historique sur les Ouvrages et la Vie de M. le Baron G. Cuvier*; A. De Candolle,

Notice sur la Vie et les Ouvrages de G. Cuvier, in the *Bibliothèque Universelle de Genève*, vol. xlix.; and the *Éloges* of Messrs. Parisot, Flourens, Pasquier, Laurillard, &c.)

CUVIER, FREDERIC, the younger brother of Georges Cuvier, was born at Montbéliard, June 28, 1773. Frederic, like his more famous brother, early devoted himself to the study of natural history; and though he never accomplished anything comparable in scientific value, he was perhaps little his inferior in research, and he contributed many works of considerable learning and interest to the naturalist's library. Of his separate works, the best known is his '*Histoire Naturelle des Mammifères*,' published in 1824, in which scientific precision and popular interest are very happily combined. This work is much admired in France for its elegance and purity of style. M. Frederic Cuvier was a careful observer, and has given the result of his reading and observation in numerous papers on zoology in the '*Dictionnaire des Sciences Naturelles*.' The important volume on 'Cetacea,' in the supplement to Georges Cuvier's edition of Buffon, is by Frederic Cuvier; the introduction is especially marked by broad and comprehensive views. But M. F. Cuvier's most strictly scientific work is one he published in 1822 on the 'Teeth of Animals,' and which is believed to have had considerable influence in leading to the adoption of a more rigorous method of classifying the *Mammalia*. M. Frederic Cuvier, who was greatly esteemed for his personal qualities as well as for his extensive acquirements, died at Strasbourg, on the 17th of July 1838.

CUYP. [KUYP.]

CYBÒ, a Genoese family, said to be of Greek extraction, several individuals of which distinguished themselves in the military service of their country during the middle ages. Pope Innocent VIII., who was elected in 1485, was of this family; and his grandson, Lorenzo Cybò, married, about 1520, Ricciarda Malaspina, heiress of the princely fiefs of Massa and Carrara. His son, Alberico Cybò Malaspina, after the death of his parents, became lord of Massa and marquis of Carrara in 1553, and his title were confirmed by a diploma of the Emperor Maximilian, dated August 1568. Alberico is still remembered both at Massa and at Carrara as a wise and beneficent prince. He died at a very advanced age in 1623, and was succeeded by his grandson Charles, who, dying in 1662, was succeeded by his son Alberico II. Alberico II. obtained of the emperor Leopold I. the title of principality for his marquisate of Carrara, and he and his successors were thenceforth styled dukes of Massa and princes of Carrara. Alberico II. died in 1690, and was succeeded by his son Charles II. Alberico III., Charles's son, succeeded his father in 1710, and received the investiture of Massa and Carrara by a diploma of the Emperor Charles VI. Alberico III. died childless in 1715, and was succeeded by his younger brother Alderano, who died in 1731, leaving three daughters, the eldest of whom, named Maria Theresa, married Ercole Rinaldo of Este, prince of Modena, in 1741, having obtained for herself from the emperor Francis I. the investiture of her maternal inheritance. Maria Theresa died in 1790, before her husband, and was succeeded in her dominions of Massa and Carrara by her only child, Maria Beatrice, who remained after the death of her father the heiress of the two houses of Este and Cybò Malaspina. She had married, in 1771, the Archduke Ferdinand of Austria, by whom she had the late duke Francis IV. of Modena and other children. Maria Beatrice continued to administer her principalities of Massa and Carrara till the French revolutionary invasion. [BACCOCHIL.] The treaty of Vienna of 1815 restored Maria Beatrice to her dominions of Massa and Carrara. Maria Beatrice died in 1829, and her dominions reverted to her son, Francis IV. of Modena, who assumed the title of Duke of Massa and Carrara, and who was succeeded in January 1846 by his son, Francis V., the present duke. (Repetti, *Dizionario Geografico Storico della Toscana*, art. 'Massa'; Viani, *Memorie Storiche della Famiglia Cybò*.)

CYPRIANUS, ST., THA'SCIUS CÆCILIUS, one of the most eloquent of the Latin fathers, was archbishop of Carthage towards the middle of the third century. The facts and dates relating to the early portion of his life are stated by different writers with a variation which occasions uncertainty. He was probably born about A.D. 200, at Carthage, where, before his conversion to Christianity, he acquired considerable affluence as a teacher of oratory, then so indispensable to success in all public affairs. His career as a Christian appears not to have exceeded ten or twelve years; for it was not until about the fiftieth year of his age that he was gained over to the church of Carthage by Cæcilius, a presbyter, whose name he henceforth adopted. On his conversion, he sold his mansion and estate for the benefit of the poor, and observed, in his mode of life, the most ascetic severity. It is stated however that, from some unexplained circumstance, he afterwards became repossessed of his property. Having held for two years the office of presbyter, to which he was elected on his joining the Christian community, he was importuned by the people to become their bishop, in opposition to several other presbyters who sought the promotion, and he is said to have been shut up in his house by the assembled populace, who barricaded all the outlets to prevent his escape, which in vain he attempted to make at an upper window. He was consequently installed archbishop of Carthage, but the persecution under the Emperor Decius having soon afterwards commenced, Cyprian fled, and so closely concealed himself during about a year and a half, that the place of his retreat appears never to have been known. This flight and long desertion of his flock occasioned much scandal

against the church, and caused the clergy of Rome to address those of Carthage on the subject. (Cypr., 'Epist.' 2.) The plea anxiously alleged by the archbishop and his apologist Pontius is an especial revelation from God in a vision. ('Deus secedere me iussit,' 'Epist.' 2.) That this however was a fiction is shown in 'Epist.' 5, where one Tertullus is made responsible for the advice ("A Tertullo ratio reddetur.") When the persecution was abated, Cyprian, having suffered only proscription and the confiscation of his property, returned to Carthage, and being reinstated in his bishopric, he held several councils, at one of which 85 bishops attended to legislate concerning the rebaptizing of heretics, apostates, and deserters, who, after escaping the severity of Decius by renouncing their religious profession, desired to be re-admitted into the church. On the renewal of the persecution by the Emperor Valerian, about six years afterwards, Cyprian was brought before the proconsul Paternus, with nine bishops of Numidia, who were condemned as profane disturbers of the peace, and sent to work in the mines. Cyprian was banished to Curubis, about 40 miles from Carthage. By Galerius, the successor of Paternus, he was restored to his former dignities; but on his refusal to sacrifice to the pagan deities in obedience to the emperor's commands, he was seized by a band of soldiers, and was sentenced to be beheaded as an enemy to the gods, and a dangerous seducer of the people. He was led from the consular palace of Sextus to an adjoining field surrounded with trees, which were filled with thousands of spectators, in the midst of whom he submitted with much fortitude to his sentence. That the populace must have experienced a great reversion of sentiment towards their archbishop since they constrained his acceptance of office, is evident from this acquiescence in his death, and from the fact that, previous to this event, they loudly demanded in the theatres that he should be thrown to the lions. This change arose apparently from the harsh and ascetic austerity of Cyprian in denouncing not only idolatry and licentiousness, but the reasonable and natural gratification of the passions.

The writings of Cyprian are numerous and valuable, as containing much curious and important information concerning the doctrines and discipline of the primitive church: they consist of two kinds, epistles, and tracts or sermons. Of the epistles there are 88, many of which appear to have been written during the eighteen months of his concealment. The following few notices will show the kind of subject to which these epistles relate. In the one to Donatus he relates, with much rhetorical embellishment, the circumstances of his own conversion, and shows the advantages of monastic seclusion and abstinence. In that to his priests and deacons he gives advice about escaping from persecution. The one to Cornelius contains passages of much importance to the apologists of the church of Rome, in which are mentioned, "Petri cathedra atque ecclesia principalis unde unitas sacerdotalis exorta est." The epistle to Fides contains the judgment of Cyprian and a council of bishops in favour of infant baptism. Another to Magnus on the same subject asserts that sprinkling is no less efficacious than dipping. One to Pomponius reproves the licentious abuses of monachism, and the prevalent custom of virgins living with the clergy, ostensibly for pious instruction, but really for sensual indulgence. An epistle to Cælius is important as insisting upon the absolute indispensableness of mixing water with the eucharistic wine. In some ancient manuscripts three epistles are given besides the above-mentioned number, one of which, from Pope Cornelius to St. Cyprian, is replete with abuse and insolence.

The following are the principal tracts of Cyprian:—"De Lapsis," that is, concerning those who, from persecution, had deposed into idolatry, in which are several miraculous stories of very incredible character. 'On the Unity of the Church': this is a treatise which both from the Roman and English hierarchy has received especial attention. It strongly denounces all schismatic separation, declaring that there is no crown, even for martyrdom, out of the pale of the true church. The discourse 'On Mortality' was written at the time of a dreadful plague, which for several years devastated the Roman empire, and is chiefly remarkable as showing the lamentable want of a due estimate of the value of life which distinguished the religious enthusiasm of that age. The 'Exhortation to Martyrdom' consists of twelve clauses of scriptural passages exhibited to encourage and stimulate the faithful in submitting to tortures and death. The treatise 'Against the Jews' is also a series of texts, quoted and verbally applied, as usual at that time, without any regard to the sense of the context. In the tract 'On the Dress of Virgins' ('De Habitu Virginum') many facts are mentioned which illustrate the social state of those times. A severe denunciation is directed against the passion among rich and youthful females for immodest attire, extravagant ornaments, the use of paint and cosmetics, and the dyeing of black hair a flaxen yellow in imitation of the Germans. The immoral habits of unmarried women appear to have furnished an especial subject for the sermons not only of Cyprian, but of all the primitive fathers. Besides a discourse on the Lord's Prayer, which has received high commendation, there are four which are considered to be wrongly ascribed to St. Cyprian; one is a turgid declamation in praise of Martyrdom; the second is on Chastity; and the other two against Theatra, and against the heretic Novatian.

The style of Cyprian much resembles that of his master and favourite author Tertullian. He treats the same subjects in the same

manner, and though his language is more artificial, it is similar in harshness and occasional barbarisms. His eloquence is admired however by Jerome and even by Lactantius. In credulity he appears to have had but few equals, if indeed he believed (which is very doubtful) all the miraculous stories he relates; for besides his own continual visions, which happened generally to authorise some act of episcopal power unapproved by his clergy and people, he seriously appeals not only to the deeds of demons or rather maniacs, and to the dreams of poor and ignorant women, but to the revelations of 'little boys full of the Holy Ghost.' ('Epist.' 9.)

There are several good editions of his works, among which may be mentioned that of the 'Opera Omnia,' Oxford, fol., 1683, and Amsterdam, 1700; but the editio optima is that of Paris, in fol., 1726. The following translation of the whole is in general accurate and faithful: 'The genuine Works of St. Cyprian, with his Life, as written by his Deacon Pontius, all done into English from the Oxford edition, and illustrated with notes, by Nathaniel Marshall, LL.B., fol., 1717. The whole works and life have also been translated into French, by Lambert, 1682. Translations of separate tracts are very numerous. That 'On Mortality,' with others, is Englished by Elyot, 1534; by Brenda, 1553; by Story, 1556; and by Lupset, 1560. 'On the Lord's Prayer,' by Paynel, 1539. 'On Virgins,' by Barksdale, 1675. 'On the Unity of the Church,' by Bishop Fell, 4to, 1681; and by Horsburgh, 1815. The life and martyrdom of Cyprian, by Pontius, his intimate friend, is still extant, and printed in several editions of the 'Opera Omnia;' but the style is too rhetorical for simple truth. The substance of this account is given in Lardner's 'Credib.,' vol. iii.

(*Lives of the Saints*, by the Rev. Alban Butler, vol. ix., p. 172, contains an elaborate biography of Cyprian; Dr. Adam Clarke, *Succession of Sacred Lib.*, vol. i., p. 177; Cave, *Hist. Lit.*; Le Clerc, *Biblioth.*; Tillemont and Bollandus; Poole, *Life and Times of Cyprian*, Oxford, 1840; Taylor, *Ancient Christianity*; Dr. Middleton, *Inquiry*.)

CYRIL, ST., of Jerusalem, was born in that city about A.D. 315, and received among the clergy there an education for the church. In 345 he was ordained priest and catechist by Maximus, the Patriarch, or, which is in fact the same thing, Archbishop of Jerusalem. On the death of that prelate in 350, Cyril was chosen to succeed him; and the commencement of his episcopate is said to have been signalled by a wonderful luminous appearance in the heavens, called the 'Apparition of the Cross.' It is spoken of in the Chronicle of Alexandria, by Socrates (lib. ii. c. 28), by Philostorgius (lib. iii. c. 26), and by several other ecclesiastical historians. The letter immediately written by St. Cyril to the Emperor Constantius describing this miraculous phenomenon, is quoted in proof of the fact by Sozomen, Glycas, Theophanes, John of Nicaea, Eutychius, and many subsequent writers: Dr. Cave, in his 'Life of St. Cyril,' inserts it entire. It is stated that on the nones (7th) of May, 351, at nine in the morning, a great mass of light, far brighter than the sun, was observed over Golgotha, and extending to Mount Olivet (two English miles); that it assumed the form of a cross, and was seen during several hours by all the inhabitants of Jerusalem.

The zeal with which St. Cyril enforced and defended the doctrine of the consubstantiality of the Son, with the jealousy about precedence, and the ambitious encroachment of jurisdiction, which characterise the episcopal history of that age, occasioned Acacius, the Arian bishop of Caesarea, to commence a course of persecution against him, which terminated in his deposition by a council in 357. On this he retired to Tarsus until 359, when, by a council of Seleucia, he was re-established in his see, but through the party of Acacius he was deposed a second time by a council of Constantinople in 360. On the accession of Julian, who, to increase the broils of the church, recalled all the exiled bishops, Cyril returned to his bishopric, from which, under the Emperor Valens, he was in 367 expelled a third time by Eudoxus, the Arian bishop of Constantinople. Finally, under Theodosius, who favoured the Trinitarian sect, he was again restored by a council of Constantinople in 381; and notwithstanding the ambitious and schismatic contests of the bishops and clergy, he remained in his see until his death in 386. An incident noticed by all the biographers of St. Cyril, is the celebrated attempt of the Emperor Julian to rebuild the temple of the Jews at Jerusalem, ostensibly for the purpose of promoting their religion, but really with the sinister view of falsifying the prophecies respecting its irreparable destruction. It is said that notwithstanding the enthusiastic expectations of the Jews, and the prodigious preparations and actual commencement of the work, St. Cyril's reliance on the infallibility of the Scriptures, induced him to persevere in predicting the failure of the project; and that accordingly a series of earthquakes, storms of lightning, and subterranean eruptions of fire and smoke destroyed all the materials and a multitude of workmen, the garments of those who escaped being impressed with shining phosphoric crosses, which even by washing could not be effaced. The particulars of this miraculous fulfilment of Cyril's prediction are related by St. Gregory Nazian ('Orat. 4 advers. Julian'); by Theodoret, Socrates, St. Chrysostom, Philostorgius, Sozomen, and St. Ambrose. See also Bishop Warburton's Dissertation on the subject, p. 88.

The extant writings of St. Cyril are in the Greek language, and consist of eighteen books of catecheses, or sermons, delivered during Lent to the catechumens, called before baptism *Illuminati*; five similar

discourses delivered during Easter week to the neophytes after baptism, called *Mystagogic*, being explanatory of the mysteries of the Christian sacraments; a treatise on words, and the letter to Constantius; besides which, several homilies and epistles are sometimes improperly included. Rivetus, in his '*Critica Sacra*' (lib. iii., c. 8, 9, 10, '*De Cyrilli Catechesibus*'), considers the five *Mystagogies*, and the letter to Constantius, as supposititious; but by Vossius, Cave, Mill, Whittaker, and Bishop Bull, they are received as genuine. The books of Catecheses are crowded with quotations from Scripture, and the style is dull and tiresomely prolix; but the facts they contain relating to the doctrines and discipline of the Eastern church in the 4th century are extremely interesting to the student of Christian antiquities. In the first Catechesis are described the effects of baptism. The fourth gives an exposition of all the Christian doctrines, and treats of numerous questions concerning the body, soul, virginity, marriage, &c. The subsequent discourses exhibit and enjoin a belief in the miraculous virtues of the relics of saints, which are represented as worthy of all veneration; in the efficacy of prayers and sacrifices for the dead; in the powers of exorcism, consecrated unction, oil, and water. Christians are exhorted to cross themselves on every occasion and action throughout the day. The enthusiastic adoration of the cross displayed by St. Cyril was probably owing to his officiating in the church of the Holy Cross in Jerusalem, where, after the '*Invention of the Cross*,' it was deposited in a silver case, and shown by the archbishop to thousands of pilgrims, who each took a little chip of it without occasioning any diminution of its bulk; hence one of his proofs of the truth of the gospel history of the Crucifixion is the fact of the world being full of chips of the cross. A description of this cross is given by Dom Touttée at the end of his edition of Cyril's works.

The doctrine of the uninterrupted and perpetual virginity of Mary is taught by Cyril. The state of virginity in general is extolled as equal to that of angels, with an assurance that, in the day of judgment, the noblest crowns will be carried off by the virgins. The resurrection is proved and illustrated by the story of the Phoenix. That Cyril's superstitious credulity and love of the marvellous was remarkably great is apparent not only from such instances as the above, but by his relating, without suspicion of their truth, the most puerile and absurd stories. In the five *Mystagogies* are described the ceremonies which precede baptism; the anointing with oil the forehead, face, ears, and nose; the forms of exorcism, the holy chrism, confirmation, the eucharist, liturgy, and communion. The dogma of transubstantiation is most explicitly enforced: we are said to be made consubstantial and consanguineal with Christ by his body and blood being distributed through our bodies, and extremely minute directions are given for the mode of receiving the eucharist bread and wine.

Millé's edition of the '*Opera Omnia*,' Grace et Latine, fol., 1703, contains notes, three indices, and the various readings; but the editio optima is that by Augustus Touttée, a Maurist monk, Gr. et Lat., fol., 1720.

(*Lives of Saints*, by the Rev. Alban Butler, vol. iii.; Dr. Adam Clarke, *Succession Sac. Lit.*, vol. i.; Lardner, vol. iv.; Grodecus, *Vita St. Cyrilli*; Tillemont, Guericke, &c.)

CYRIL, ST. (CYRILLUS), of Alexandria, was educated under his uncle Theophilus, the bishop of Alexandria, by whom St. Chrysostom was persecuted and deposed. On the death of Theophilus in 412, Cyril was elected patriarch, that is, archbishop of Alexandria. His episcopal power was first displayed in shutting up and plundering the churches of the puritan sect founded by Novatian. Cyril next exhibited his zeal against heretics by heading a furious mob of fanatics, who drove out all the numerous Jewish population from Alexandria, where, since the time of Alexander, its founder, they had enjoyed many privileges, and were politically important as contributors to the public revenue. This arrogant proceeding therefore highly excited the anger of Orestes, the governor of the city, and made him henceforth the implacable opponent of the bishop, who, in the name of the Holy Trinity and Gospels, in vain implored a reconciliation. In consequence of the enmity thus created, and of Cyril's resentment of the checks opposed to his ambitious encroachments on the jurisdiction of the civil power, a murderous attack was made on the governor in his chariot by a band of 500 monks; and one who severely wounded him having suffered death on the rack, Cyril, in his church, pronounced a pompous eulogy over his body as that of a glorious martyr. (Soc., l. vii., c. 14.) By the philosopher Euzapius ('*Vita Eusebii*') these monks are described as swine in human form. The tragic story of Hypatia, the daughter of the mathematician Theon of Alexandria, furnishes further evidence of the revengeful disposition of St. Cyril. This lady, whose wonderful abilities enabled her to preside over the Alexandrine school of Platonic philosophy, was the especial object of the bishop's enmity, partly, as is said, arising from envy at the depth and extent of her knowledge, which drew to her lectures the greatest philosophers and statesmen, and a crowd of students from Greece and Asia; but chiefly because of her intimacy with the governor and her great influence over him, which Cyril and his clergy suspected was exerted against them. The consequent murder of Hypatia is circumstantially related by several ecclesiastical historians. (Soc., l. vii., c. 18 and 19; Nicephorus, l. xiv., c. 16; Damascius, in '*Vita Isidori*'; Hesychius and Suidas, in '*Trivaria*'; Photius, '*Annot. ad Socrat.*' l. vii., c. 15.) In these accounts it is stated that Cyril, having vowed the

destruction of this accomplished woman, a party of infuriated wretches, whom Nicephorus (*ubi supra*) expressly declares to have been Cyril's clergy, led on by Peter, a preacher, seized her in the street, and having dragged her into a church, completely stripped her, tore her to pieces, carried the mangled fragments of her body through the streets, and finally burnt them to ashes, 415. (See Toland's '*Hypatia, or the History of a most beautiful, virtuous, learned, and accomplished Lady, who was torn to pieces by the Clergy of Alexandria, to gratify the Cruelty of their Archbishop, undeservedly styled St. Cyril*,' 8vo, 1730. The story of Hypatia has been made, as will be remembered, the subject of a sort of philosophical novel by the Rev. Charles Kingsley.)

The titles of Doctor of the Incarnation and Champion of the Virgin have been given to Cyril, on account of his long and tumultuous dispute with Nestorius, bishop of Constantinople, who denied the mystery of the hypostatic union, and contended that the Divinity cannot be born of a woman—that the divine nature was not incarnate in but only attendant on Jesus as a man, and therefore that Mary was not entitled to the appellation then commonly used of Mother of God. (Pluquet.) The condemnation and deposition of Nestorius having been decreed by Pope Celestine, Cyril was appointed his vicergerent to execute the sentence, for which he assembled and presided at a council of sixty bishops at Ephesus. But John, the patriarch of Antioch, having a few days afterwards held a council of forty-one bishops, who supported Nestorius and excommunicated Cyril, the two parties appealed to the Emperor Theodosius, who forthwith committed both Cyril and Nestorius to prison, where they remained for some time under rigorous treatment. Cyril, by the influence of Celestine, was at length liberated and restored (431) to the see of Alexandria, which he retained until his death, which occurred in 444.

The works of Cyril are numerous, and chiefly on subjects connected with the Arian controversy, the incarnation, consubstantiality of the Son, and similar difficult points, which are involved in additional obscurity by an intricate perplexity of style and the use of barbarous Greek. The following are some of the principal treatises:—'*Thesaurus on the Trinity*,' intended as a complete refutation of Arianism. In '*Dialogues on the Incarnation*,' in '*Five Books against Nestorius*,' and in an ample '*Commentary on St. John's Gospel*,' the same subject is continued. Ten books against Julian contain replies to that emperor's three books against the Gospels, which, if Cyril's quotations are faithful, were as weak and absurd as the answers. Seventeen books '*On Worship in Spirit and Truth*,' show that all the Mosaic institutions were an allegory of the Gospel; "a proof," says Dr. Adam Clarke, "how Scripture may be tortured to say any thing." Thirteen books on the Pentateuch and the Prophets are written with a similar view. Thirty paschal Homilies, announcing, as customary at Alexandria, the time of Easter. Sixty-one Epistles nearly all relate to the Nestorian controversy. Cyril's '*Synodical Letter*,' contains twelve solemn curses against Nestorius, who as solemnly replied with twelve curses against Cyril. In a treatise against the Anthropomorphites, or those Egyptian monks who taught that as man is made in the express image of his Maker, God has the form and substance of a human body Cyril reproves them for their gluttony and idleness, and answers with great metaphysical skill a series of perplexing queries, but such as were most unworthy to be either asked or answered by Christian divines. Cyril throughout his works enforces the adoration of Mary as the mother of God, and explicitly teaches the doctrine of transubstantiation, declaring that by taking the Lord's body we become consubstantial with God, being blended together like two portions of melted wax. "The history of none among the Christian fathers," says Dr. Adam Clarke, "is more disgraceful to the Christian character than that of St. Cyril of Alexandria—a man immoderately ambitious, violent, and headstrong; a breeder of disturbances; haughty, impetuous, and as unfit for a bishop as a violent, bigoted, unskilful theologian could possibly be—but resolved that if the meek inherit the earth, the violent should have possession of the seas." The editio optima of the '*Opera Omnia*' of Cyril is that in 7 tom. fol., Greek and Lat., Paris, 1638. Spanheim's edition of Julian's works contains Cyril's work against Julian.

(Clarke, *Succession Sac. Lit.*, vol. ii. p. 187; Cave, *Hist. Lit.*, vol. i.; Socrates, *ubi supra*; Tillemont, tom. xiv. p. 272; Butler, *Lives of Saints*; Coillier, tom. xiii. p. 241; Rivetus, *Critica Sac.*; Lardner; Neander, &c.)

CYRILLUS, the author of a Greek glossary, which some have attributed to the bishop of the same name. It is printed in the appendix to the London edition of H. Stephen's Greek Lexicon, 1826.

CYRUS I., founder of the Persian monarchy, began to reign about B.C. 559. Even in the time of Herodotus the history of Cyrus was so obscured by legendary tales that the truth could not be separated from the fiction. His original name appears to have been Agradatos (Strabo, p. 729 *d.*): the word Cyrus is said to have signified the sun, and this name was probably assumed by him when he became king. (Heeren, '*Ideen*.) Cyrus was the son of Cambyzes, a Persian, and Mandane, daughter of Astyages, king of Media, and hence was called by the oracle a mule. (Herod. i. 91.) In consequence of a dream of Astyages, which portended that the offspring of his daughter would take the throne of the Medes, he ordered Cyrus to be destroyed as soon as he was born. Harpagus, a person of rank in the king's

household, was charged with the commission, but being reluctant to execute it, gave the child to the king's herdsman to put to death. The herdsman's wife, who just at this time was delivered of a still-born male child, persuaded her husband to preserve the life of the royal infant, and their own dead child was accordingly exposed instead of Cyrus, whom they brought up under their own roof. Among his boyish playmates Cyrus exhibited all the royal symptoms of an inclination to command and be obeyed. In their games the youths made him king, and the severity with which he enforced his orders on one of these occasions led to his being brought before Astyages, who recognised in his features a likeness to himself, and found that the time of the exposure of his grandson and the age of Cyrus agreed. The circumstances of his preservation were disclosed, and he was sent to his real parents. Astyages was less enraged against the herdsman than against Harpagus, on whom he wreaked his vengeance by the murder of his son: the youth's mangled limbs were dressed and served up at supper when Harpagus was present, and the head, hands, and feet were afterwards shown to the father in a basket, with insulting expressions. Harpagus said nothing, but meditated revenge; and it was not long before he succeeded in rousing Cyrus against Astyages. Cyrus induced the Persians to revolt against the Medes, and dethroned Astyages B.C. 560. He next attacked and took Sardis, and made Croesus prisoner B.C. 546. [CROESUS.] He besieged and took the city of Babylon B.C. 538, which he entered by diverting the course of the Euphrates and leading his army into the city by the dry bed of the river (l. 190-191.) At last he carried his arms against the Massagetsæ, and was defeated and slain by Tomyris, their queen (B.C. 529), who had his head cut off and put into a leathern bag full of human blood, saying, "Though I am alive and have conquered you, you have undone me by taking my son; but I will, as I threatened, satiate you with blood." He had reigned twenty-nine years (l. 214.) This is the account given by Herodotus, which, with a few variations, is copied by Justin. Xenophon's work on the education of Cyrus is rather an historical romance than a history, and therefore his narrative is less to be depended on than that of Herodotus, from which it differs materially. Both Xenophon and Ctesias ('Persica,' c. 8) [CTESIAS], make Cyrus die quietly a natural death. (See the last chapter of Cicero 'De Senectute.') The account of Ctesias as to his death is conformable with the story in Arrian ('Anab.' vi. 29) of the body of Cyrus being interred at Pasargadae. [ALEXANDER III.] The fame of Cyrus appears to have lasted to the downfall of the Persian empire; he was regarded by his countrymen as their great national hero; and his fame is still preserved in the annals of modern Persia. The Persians gave him the title of father (iii. 89), while they called his son, Cambyses, a tyrant. The capture of Babylon by Cyrus is the point at which sacred history first touches on profane. (Clinton, 'Fast. Hel.' p. 301.) Cyrus left two sons, Cambyses, who succeeded him on the throne, and Smerdis, who was murdered by the command of Cambyses. (Herod. iii. 30.)

CYRUS II. was the son of Darius II. and Parysatis. Artaxerxes, the eldest son of Darius, succeeded him as king; but Cyrus disputed the right of succession, and founded his own claim on the fact that he was the first-born after the accession of his father. Cyrus was the favourite of his mother, Parysatis, and was indebted to her intercession with Artaxerxes for the preservation of his life after he had been charged with a conspiracy against the king. He was sent back to his government in the western provinces of Asia Minor, but did not relinquish his designs on Artaxerxes. Indignant at the disgrace he had suffered by being sentenced to death, he resolved, if possible, to dethrone his brother. The great difficulty was to raise a sufficient force without exciting his brother's suspicions. Clearchus, a Lacedæmonian general, undertook to raise a body of Greek troops for the purpose of making war on some Thracian tribes. Aristippus in Thessalia, and Proxenus in Boeotia, raised troops for similar purposes and with a similar object. Artaxerxes had originally been apprised of the designs of Cyrus by Tissaphernes, but the cities which were in the government of Tissaphernes now all revolted to Cyrus, with the exception of Mileta. A war thus arising between Tissaphernes and Cyrus, gave Cyrus a pretext for openly collecting his forces, and even for soliciting the aid of the king, to whom he made heavy complaints of the conduct of Tissaphernes. Artaxerxes was thus blinded to the real aims of Cyrus, who explained his intentions to no Greek but Clearchus, lest they should be deterred from joining him by the boldness of the attempt. When his forces were all collected, he set out from Sardis, the seat of the Persian authority in Western Asia (B.C. 401), without the soldiers knowing anything more of the objects of the expedition than that he was going to march against the Pisidians, who had infested his province. Tissaphernes however with his characteristic cunning saw that the preparations were much too great to be really intended against the Pisidians, and accordingly he went with all expedition to inform the king. Artaxerxes no sooner heard of the ornament of Cyrus than he began to make preparations for opposing him. Cyrus in the meantime was continuing his march through the southern provinces of Asia Minor, passing through Celæne, Pelus, Thymbrium, Tyrræum, Iconium, and Dana, till he arrived at the foot of the Taurus, which he crossed and arrived at Tarsus. Here the Greeks refused to march any farther: they suspected that they were going against the king and

declared that they were hired for no such purpose. The tumult was partially appeased by the influence of Clearchus, who persuaded them to send deputies to Cyrus to enquire what was the real object of the expedition. Cyrus, by an artful evasion, which however was partly seen through by the soldiers, pretended that he had an enemy, Abrocomas, on the banks of the Euphrates, at the distance of a few days' march, and that he was advancing against him. A promise of half as much pay again as they had received before, induced them to proceed; but it was not till some time after that it was openly stated that they were going against the king. At last, on arriving at the plain of Cynaxa, in the province of Babylon, Cyrus found Artaxerxes ready to oppose him with an immense army. Clearchus advised Cyrus not to expose his own person, but he rejected the counsel. As soon as the enemy approached, the Greeks attacked them with such vigour that the disorderly and ill-assorted army of the king forthwith took to flight. While Artaxerxes was preparing to attack in the flank, Cyrus advanced against him with a large body of horse, and with his own hand killed Artageres, the captain of the king's guards, and routed the whole troop. Just at this moment, spying the king himself, and crying out "I see him!" he rushed forward and engaged with him in close combat. He killed his brother's horse and wounded the king himself. The king mounted another horse, but Cyrus attacked him again, and gave him another wound, and was in the act of giving him a third when he himself was slain. The select guards and friends of Cyrus, not choosing to survive their master, killed themselves on his body. With the life of Cyrus ended the cause in which he died, and the Greeks effected their retreat under the command of Xenophon and others. [XENOPHON.] The whole expedition occupied fifteen months.

The character of Cyrus is highly eulogised by Xenophon ('Anab.' i. c. 9.) In his childhood and youth he excelled all his companions in those pursuits which belonged to their rank. He was fond of war and hunting. His justice was conspicuous in all his conduct, both public and private, and he never suffered the evil-doer to go unpunished. To those who deserved reward for services he was unbounded in his munificence, and his friends received frequent tokens of his kind remembrance. On the whole it was the opinion of Xenophon that no individual had ever secured the affections of a greater number of men, whether Greeks or others. According to a passage in Xenophon quoted by Cicero ('De Senectute,' c. 17), Cyrus was fond of agricultural and horticultural labours, and worked with his own hands.

(Xenophon, *Anabasis*, i.; Plutarch, *Artaxerxes*; Diodorus Siculus, xiv.)

CZACKI, TADEUSZ, an eminent Polish statesman and author, was born in 1765 or 1766, at Poryck in Volhynia, where his father was a large landed proprietor. Czacki's life has been written by two of his personal friends—by Stanislaus Potocki in a funeral panegyric read before the society of 'Friends of Science' at Warsaw in 1817, and by Mostowski in the supplement to the 'Biographie Universelle' published in 1836; and it is curious to observe how frequently they differ in the facts of his biography. According to Potocki he was "educated under the eye of his father, and was the consolation and support of his old age;" according to Mostowski he was "deprived from infancy of the assistance of his father, who was kept for seven years a prisoner in Russia." Again, at a later period of life he was, according to Mostowski, for some years a professor at the university of Cracow; Potocki does not allude to the circumstance, but speaks in the portion of his narrative relating to that period of his life of his eminent services in re-establishing the banks at Warsaw. It is agreed by both that Czacki, unlike most of his countrymen of the same rank, received his education in Poland alone; that he was early distinguished by his consummate knowledge of Polish affairs; and that at the age of two- or three-and-twenty he became one of the most active ministers of the cabinet of King Stanislaus Poniatowski, reforming the system of weights and measures, proposing improvements in the water-communication, drawing up a map of the rivers of Poland, and finally taking a part in the construction of the new constitution of the Third of May 1791, which was followed by the hostilities terminating in the final dismemberment of Poland. Czacki took an active part in these disastrous times as an adherent of the patriotic party, and his estates were in consequence confiscated by the Russian victors. The accession of the Emperor Paul to the throne of Russia led to the liberation of Polish captives, and the restoration of Polish estates, and among others Czacki received back his large possessions in Volhynia, and from this period he became known as the munificent patron of Polish education. He was allowed to found a high school, which was opened at Krzemieniec in 1805, to which he devoted almost the whole of his property and his time, and in which he introduced instruction in the fine arts and in bodily exercises, as well as in the sciences and the languages, with so much success that it speedily became the most popular school in Poland for both sexes, and numbered about six hundred pupils. The suspicions of the Russians were excited that the instruction given was of too patriotic a character, and a commission was appointed in 1807 to inquire into the management of the school, when Czacki vindicated himself so much to the satisfaction of the Emperor Alexander, that he was appointed deputy of Prince Czartoryski, superintendent of public instruction. These suspicions however revived, and it is perhaps doing no injustice to Czacki to suppose

that he was not extremely anxious to inculcate into the minds of the youth of Poland the principle of unlimited submission to Russian sway. He again cleared himself before a second Russian commission in 1810, but the school was broken up for the time by Napoleon's invasion of Russia in 1812, and in the following year, on the 8th of February 1813, Czacki died rather suddenly at Dubno.

A collection of Czacki's works was issued in three volumes in 1843 at Posen by the indefatigable Count Edward Raczyński. He states in the preface that many of the single books had at that time become rare, and were eagerly bought at high prices. The best however and most extensive is that 'O Litewskich i Polskich Prawach' ('On Lithuanian and Polish Laws'), which is not a work of legal learning merely, but of miscellaneous information on subjects to which the laws relate, Czacki inserting for instance, when he comes to speak of the coinage, one of the complete treatises extant on Polish numismatics. His shorter works, 'On the Jews,' 'On the Gypsies,' 'On the Statistics of Poland,' &c., are all rich in information on the subjects treated, and are written in a concise and entertaining style, which has been censured for the unusual fault in an antiquary of being too condensed.

CZARTORYSKI, FAMILY OF. The Czartoryski family is descended from Korygello, one of the sons of Olگرد, the founder of the Jagellonian dynasty of Poland. A son of Korygello, having in the early part of the 15th century become possessor of a domain called Czartorya, assumed the name of Czartoryski. His descendants in course of time came to be reckoned among the wealthiest and most influential of the Polish nobility; but it was not till towards the middle of the 18th century that the Czartoryskis began to take a leading part in public affairs. At that time, PRINCE MICHAEL CZARTORYSKI (born 1696, died 1775), who had been successively castellan of Wilna, vice-chancellor of Lithuania, and (in 1752) grand-chancellor, and his brother, PRINCE AUGUSTUS (born 1697, died 1782), a palatine and lieutenant-general of the army of the crown, determined to endeavour to raise the country from the state of anarchy into which it had fallen by changing the constitution of Poland into that of a well-organised and powerful monarchy. They were both men of considerable activity and energy, and they held positions of great influence; but they were opposed by the majority of the nobles, who were unwilling to part with any of their privileges. The nobles were supported by the Saxon dynasty, and by Austria, and the Czartoryskis turned to Russia for assistance. Catharine, who was then on the Russian throne, readily rendered them her support, and by her influence her favourite, Stanislas, a relative of the Czartoryskis, was elected king. But they soon found that in calling in Russian aid they had destroyed the last spark of national independence. The Russian court, within a short time, overturned all the reforms which the Czartoryskis had introduced, and then followed the dismemberment of the kingdom.

ADAM CASSIMIR CZARTORYSKI, son of Prince Augustus, was president of the diet which elected Stanislas Poniatowski. While earnestly labouring to carry out the views of his father and uncle for the regeneration of Poland, he yet, like them, believed that it was through Russian influence that this object was to be accomplished. He took little part in the struggles of his countrymen after the first partition of Poland, and he wholly retired from public life in 1813. He took up his residence in Austria, and died in Galicia in 1823. Prince Adam Cassimir was starost-general of Podolia, and master of the ordnance (feldzeugmeister) in the Austrian army.

*ADAM GEORGE CZARTORYSKI, son of Prince Adam Cassimir, and perhaps the most eminent of the family, was born at Warsaw on the 14th of January 1770. Having received a careful education, for the completion of which he visited France and England, he was introduced into the public service; and on the second partition of Poland in 1792 he joined the Lithuanian army under Zabiello, in the campaign against Russia. On the destruction of that army and the division of the last remnant of the country between the three invading powers, Adam Czartoryski was, by command of Catharine, sent with his brother Constantine as hostages to St. Petersburg. Here he was attached to the Grand-duke Alexander Pavlovich, whose favour he obtained by his prudence and ability. So high a reputation indeed did he gain for these qualities, that in 1797 the Emperor Paul appointed him ambassador to Sardinia. Alexander soon after his accession to the throne recalled Czartoryski, and in 1802 appointed him assistant to the minister of foreign affairs. He was present at the battle of Austerlitz in 1805, and in 1807 took part officially in the conferences at Tilsit. He withdrew afterwards from public life, but in 1813 accompanied the Emperor Alexander to Vienna and to Paris. In the various changes which occurred in Polish affairs during the following years Adam Czartoryski, when not an actor was an observant spectator; but entertaining feelings of strong personal friendship for Alexander, he continued to repose confidence in his good intentions towards his country, and he did what he could to induce his countrymen to remain quiet. At the same time he appears to have laboured in secret to keep up a spirit of nationality. When the Academy of Wilna was raised into a university in 1803, Czartoryski was appointed curator of it. The students on more than one occasion showed symptoms of dissatisfaction with the Russian yoke, and the tyranny of the Grand-duke Constantine at length excited them to such a degree that it was easy for the Russian police to establish a charge of

sedition against them. Constantine directed the most severe measures to be adopted. A large number of the students were arrested and thrown into prison, others were sent to Siberia, or forced to serve as common soldiers in the army. Czartoryski indignantly protested against these proceedings, and finding his remonstrances disregarded, he threw up his office. His successor, Novossiltzoff stated in his report to the emperor on the condition of the university, that "the Prince Czartoryski by his occupancy during twenty years of the curatorship of the University of Wilna, has thrown back for at least a century the amalgamation of Lithuania with Russia."

On the breaking out of the Polish revolution in 1830, Czartoryski entered with all his heart into the popular movement. As president of the provisional government he summoned a national diet in December 1830. The diet in January 1831 declared the throne of Poland vacant, and elected Adam Czartoryski president of the national government. The prince in accepting the office offered the half of his immense fortune to the public service. Under his direction vigorous measures were adopted, and for awhile success attended the Polish arms. But in addition to the insufficiency of the national resources for opposing the enormous power of Russia, and the covert aid which Prussia afforded to the Czar, there was the perhaps greater evil of internal dissension. This eventually broke out into open insurrection at Warsaw, August 15, 1831, and the government of Adam Czartoryski formally resigned its functions. The prince himself volunteered to serve as a private in the national army; but the national cause was crushed. Adam Czartoryski was specially excluded from the benefits of the general amnesty, and his estates were confiscated. But he escaped in safety to Paris, where on the proceeds of his Austrian property he has since resided, and where he and his wife, a member of the eminent Polish family Sapieha, have been foremost in every friendly service to the less affluent among their expatriated fellow-countrymen.

*CONSTANTINE ADAM CZARTORYSKI, born in October 1773, who was sent with his brother Adam as a hostage to St. Petersburg in 1795, returned to Poland in 1800; in 1809 was named Colonel of a Polish regiment of infantry, and in that capacity served in the campaign of Moscow in 1812. He quitted the Russian service in 1813, and retired to Vienna.

*CZUCZOR, GERGELY, or GREGORY, a living Hungarian poet, prose-writer, and lexicographer, considered by his countrymen to stand in the first rank of their men of letters, and remarkable for the singularity of the incidents of his life, as well as the number and value of his literary productions. He was born on the 17th of December 1800, at Andód, in the county of Nyitra, of Catholic parents. In his seventeenth year he entered the Benedictine order, and after the usual novitiate and years of preliminary study, in his twenty-fourth year he took holy orders. By his frequent and impressive preaching, and by his attention to his priestly duties during the time of the cholera, he acquired a high degree of public esteem. At the same time he was securing a name in literature by the composition of a series of epic poems, of which the first, 'Augsburgi Útközet' ('The Battle of Augsburg') appeared in 1824; the second, 'Aradi Gyűlés' ('The Meeting at Arad') in 1828; and a third, still incomplete, the best of the three, on the exploits of John Hunyadi, the great Transylvanian hero, was issued in portions in the 'Aurora,' an annual edited by Charles Kisfaludy, which was for some years the receptacle of the best productions of Hungarian literature. When the Hungarian Learned Society was established, which now bears the name of the Hungarian Academy, Czuczor was elected a member at its first meeting. This was in 1831; and in 1835, after several contributions on historical subjects to the 'Transactions' of the Society, he was chosen assistant-secretary, while his friend Schedel, better known by his assumed name of Toldy, held that of secretary-in-chief. In the next year a collection of Czuczor's poetical works was published at Buda under the editorship of Schedel, and from that moment his career, hitherto so brilliant, was troubled and unhappy. The volumes contained some songs and ballads of high poetical merit, at which exception was taken as of an improper character to come from the pen of a priest. The friends of Czuczor defended him against what they stigmatised as a revival of mediæval prejudices; but he was involved in a series of unequal contests with his ecclesiastical superiors. His 'Poetical Works' were prohibited at Vienna, and he was forbidden to publish anything without submitting it to the previous censure of the Abbot of St. Martin, to whose jurisdiction he belonged. Czuczor had at that time just entered into engagements to contribute to the 'Athenæum,' a periodical established by Schedel at Pesth, on the plan of the English 'Athenæum,' and the only effect of this injunction was that his articles did not appear in his own name but under different signatures, among others of Andódi, which was sufficiently transparent, as the name of his birthplace was Andód. The abbot of St. Martin's revoked the permission which had been given him to reside at Pesth to attend to his secretaryship, and recalled him to his convent.

For some years Czuczor again pursued his course in comparative obscurity as a Benedictine, though he was entrusted with the delivery of lectures, which were attended by numerous audiences, and occupied himself with some literary labours, among others a translation of Sparks's 'Life of Washington.' The death of some of his ecclesiastical superiors produced a relaxation of the severity with which he had

been treated, and which a large party in Hungary regarded as persecution. He was permitted to revisit Pesth, and there his reputation stood so high that in 1844, when the Academy decided that the great work of compiling a national dictionary which it resolved to undertake should be conducted under the superintendence of one individual, the choice unanimously fell on Czuczor. He was allowed to accept the illustrious task, and the advance he made was so rapid that in 1848 he had already reached the letter L. In the revolution of that year Czuczor joined the party of Kossuth, and in December gave utterance to his political feelings in an article in Kossuth's newspaper, entitled 'Riadó,' ('The Tocsin.') The consequences to himself were most disastrous. On the 18th of January 1849 when the Austrians entered Pesth, he was seized and taken before a military tribunal, which condemned him to six years' imprisonment in irons. The president of the Academy, Count Teleki, himself the historian of Hungary, of whom Czuczor was the poet, interceded with Prince Windischgratz for a mitigation of punishment, chiefly on account of the national importance of the lexicographical duties in which Czuczor was engaged, and

on the 14th of February he was, as a favour, released from his fetters. On the 21st of May the Hungarians took Buda by storm, and among the prisoners whom they found in the castle was Czuczor, who, by his intercession, saved the lives of an Austrian regiment from the rage of the victors. His health had so suffered by his imprisonment that he left the capital for Tihany to try the effect of country air. The final success of the Imperialists, aided by the Russians, left him no choice except between imprisonment and exile, and he surrendered to General Kempen. He resumed his labours on the dictionary at the Franciscan monastery at Pesth, at which he was first confined, and at Kufstein to which he was afterwards removed, he was allowed a separate cell for that purpose. The amnesty of 1850 set him again at liberty, and by the reports of the proceedings of the academy in the 'Uj Magyar Museum,' we perceive that he is steadily advancing in his lexicographical labours. Our notice of his biography is chiefly taken from an article apparently by Schedel in the 'Ujabb kori Ismeretek Tára,' published in 1850.

D

DACIER, ANDRÉ, was born at Castres in 1651, and studied at Saumur under Taneguy Lefèvre, whose daughter Anne (born in 1654) he married in 1683. Both husband and wife became eminent among the classical scholars of the 17th century. They were employed with others to comment upon and edit a series of the ancient authors for the dauphin, which form the collection 'Ad usum Delphini.' Madame Dacier's commentaries are considered as superior to those of her husband. She edited Calimachus, Florus, Aurelius Victor, Eutropius, and the history which goes by the name of Dictys Cretensis, all of which have been repeatedly reprinted, with her notes. She published French translations of the *Amphitryon*, *Rudens*, and *Lepidicus* of Plautus, with a good preface; of the comedies of Terence, of the *Plutus* and the *Clouds* of Aristophanes, and of *Anacreon* and *Sappho*. She also translated the *Iliad* and the *Odyssey*, with a preface and notes. This led to a controversy between her and La Motte, who had spoken slightly of Homer. Madame Dacier wrote in 1714 'Considérations sur les Causes de la Corruption du Goût,' in which she defended the cause of Homer with great vivacity, as she did also against Father Hardouin, who had written an 'Apology of Homer,' which was more a censure than an apology. The warmth however with which both the Daciers resented anything that was said against the ancient writers was carried to the extreme, and had at times something ludicrous in it; but Madame Dacier's enthusiasm was real, and unaccompanied by pedantry or conceit. Neither did her learned incubations make her neglect her domestic duties as a wife and a mother; and she was generous and charitable towards the poor. She died in 1720, and her husband in 1722. The latter, besides his editions of the classics, translated also into French the works of Hippocrates, the 'Œdipus' and 'Electra' of Sophocles, the 'Poetics' of Aristotle, and the lives of Plutarch, which last translation is inferior to Amyot's; he also translated Horace, but neither the translation nor the notes are much esteemed. The 'Bibliothèque des Anciens Philosophes,' 9 vols. 12mo, was published under Dacier's name, but he only furnished some of Plato's dialogues and the *Manual* of Epictetus. Dacier was a member of the Academy of Inscriptions, secretary to the French Academy, and keeper of the Cabinet of the Louvre, and he had a pension of 2000 francs from Louis XIV.

DAGINCOURT, JEAN-BAPTISTE-LOUIS-VEROUX, was born at Beauvais, April 7, 1780. He received a superior education, on completing which he served for a short time in a cavalry regiment, but quitted it while yet young, and was named fermier-général by Louis XIV. Having devoted himself to the study of archaeology, he in 1777-78 visited England, Holland, and Germany, and spent the three following years in the chief cities of Italy, his object being to examine the treasures of art and antiquities. He then returned to France, but soon after went to reside in Rome, in order to prepare a work he had long been meditating on the history of the fine arts. This very extensive and valuable production appeared in parts, and was only completed in 1823, long after M. D'Agincourt's death. It was entitled 'L'Histoire de l'Art par les Monuments, depuis sa Décadence au Quatrième Siècle jusqu'à son Renouveau au Seizième,' and is in 6 vols. large folio, with 325 plates. The 'Histoire de l'Art par les Monuments,' though displaying no great grasp of mind, is a monument to the untiring industry of its author, and a work of great value to the student by bringing together so great a variety of examples in all the various branches of art. An English edition has been published with the plates arranged in a more compact form. M. D'Agincourt also published a 'Recueil de Fragments de Sculpture Antique, en terre cuite,' 4to, Paris, 1814. He died at Rome, September 24, 1814.

DAGOBERT I., son of Clotarius II., succeeded him in 628 in the Frankish monarchy. He gave his brother Caribert a part of Aquitania, with the city of Toulouse; but Caribert dying in 636, Dagobert reunited the whole monarchy under his sceptre, and caused Chilperic, Caribert's eldest son, to be put to death. Boggis, another son of Caribert, was

the head of the line of the dukes of Aquitaine and of the counts of Armagnac. Dagobert sustained wars against the Saxons from England, the Vascones of the Pyrenees, the Slavonians, and the Bretons, and he obliged Judicaël, the prince of Brittany, to give him satisfaction for the incursions which he had made into his territories. When the Bulgarians were flying from before the Huns, they took refuge in Austrasia, where Dagobert granted them an asylum; but soon after, fearing that these guests might become too powerful for him, he gave orders to have them all massacred in one night, when 10,000 families were put to the sword. Dagobert was cruel and debauched, like all the rest of the Merovingian kings; and yet in the old ballads and chronicles he is called 'le bon Roi Dagobert.' He published the laws of the Franks; he encouraged commerce, and opened negotiations for that purpose with the Byzantine emperors; and he made Paris his permanent residence. The wealth and splendour of his court are extolled by the chroniclers. Eligius, or Eloi, a skilful goldsmith of the time, became his treasurer and confidential minister, and was later in life made bishop of Noyon. Dagobert died in 638 in his thirty-sixth year, and left two sons, Siegbert II., who succeeded him in Austrasia, and Clovis II., who became king of Burgundy and Neustria.

DAGOBERT II., son of Siegbert II., king of Austrasia, was shut up in a convent after his father's death in 656 by Grimoald, maire of the palace, who gave the crown to his own son. Dagobert was sent to Scotland, and the report of his death was spread in France. In Scotland he married Mathilda, a Scotch princess, and after many years returned, and was acknowledged king of Austrasia. He was murdered in 679 by Ebroin, maire of the palace of Thierry III., king of Burgundy and Neustria. Pepin d'Heristal succeeded Dagobert in Austrasia, not as king, but with the title of duke.

DAGOBERT III. succeeded his father Childebert III. as king of the Franks in 711. Pepin d'Heristal continued to enjoy the whole authority, as he had done under the preceding reigns, owing to which circumstance the nominal kings have been styled in history 'Rois Fainéants.' Pepin died in 714, and Rainfroy succeeded as maire of the palace. In 715 Dagobert died, leaving a child called Thierry, who was afterwards called Thierry IV., and was set up as a nominal king by Charles Martel, the natural son of Pepin d'Heristal. (Henschenius, *Historical Dissertation on the Three Dagoberts*, 4to, 1653; Sismondi, *Hist. des Français*; Michelet, *Hist. de France*.)

DAGUERRE, LOUIS JACQUES MANDÉ, was born in 1789 at Cormeille in the department of Seine-et-Oise, France. At the outset of life he obtained a situation in a government office, but he early quitted that employment, and became a pupil of M. Degott, scene-painter at the opera. As a scene-painter, Daguerre in a few years surpassed his instructor, and placed himself on a level with the first professors of that art in Paris, while he quickly extended the capabilities of the art by various ingenious contrivances, which he invented for producing increased pictorial effect. He also assisted M. Prévost in the preparation of his panoramic views of the great cities of the world. The experience he thus acquired suggested to M. Daguerre the idea of producing a kind of scenic exhibition, in which the illusion should be more perfect than in the panorama, and he invented, in conjunction with Bouton, a method of so throwing coloured lights and shadows upon the view, as to produce the appearance of changes of season, day and night, storm and sunshine, &c. This they termed a diorama, and when exhibited, July 1822, in a circular structure erected for the purpose in Paris, the success was complete. The diorama in fact, made what the Parisians term a sensation, and no long time elapsed before Messrs. Bouton and Daguerre erected a similar building in London, to which each picture was removed, when it had been exhibited for its season in Paris. For some seventeen years picture followed picture, each rivaling its predecessor, but in 1839 a fire destroyed the building, and the view then exhibiting in it. Daguerre's loss was very great, and the building was not re-erected, as

the public interest in dioramas, which had now lost their novelty, was beginning to flag.

M. Daguerre had before this been directing his attention to a matter which was destined to secure for him a more permanent reputation than his scenery or his dioramas. This was the mechanical production of fac-simile delineations of objects by the chemical action of light. As early as about the middle of the 16th century, Fabricius had discovered the property which salts of silver possess of changing colour when exposed to the action of light, and this property had been the subject of many experiments by scientific men. Sir Humphry Davy among recent chemists had sought by various applications of this property to obtain copies of simple objects, but though he succeeded in doing this, he was unable to prevent them from being effaced when exposed to the light. In France M. Niepce began about 1814 to pursue a similar course of experiments, and he succeeded in rendering the images he obtained insensible to the subsequent action of the light; but his discovery remained very incomplete when Daguerre commenced similar experiments. About 1829 Niepce and Daguerre joined in the prosecution of their investigations. Niepce died in 1833, before they had made any decided approach to success. But Daguerre persevered, and at length his zeal and rare ingenuity met with an ample reward. He discovered in fact a method by which he was able so to prepare metallic plates, that by placing them in the darkened chamber of a camera-obscure, they received a distinct impression of the images thrown upon them by the lens of the camera, which he was enabled by a subsequent process to render indelible. It does not belong to this section of our work to state the steps by which he arrived at this grand discovery, or the method he finally adopted for producing, rendering visible, and fixing this sun-picture. It will be enough to say that with remarkable patience and ingenuity he surmounted every difficulty, and eventually produced his discovery, as to its principles, perfect. Other experimentalists had in this country and elsewhere been at work, unknown to Daguerre, at the same idea, but to M. Daguerre is due the priority of publication of the discovery, and no doubt also the priority of discovery, as far as the producing sun-pictures upon metallic plates is concerned. What has proved to be the more generally applicable process of photography, was as unquestionably the result of the independent investigations of our own countryman, Mr. Talbot; but, as was to be expected, both the processes as now practised are very different to what they were when originally promulgated by their inventors or discoverers.

Great was the excitement among both learned and unlearned when in January 1839 M. Arago gave, at a sitting of the Académie des Sciences, an account of the new method by which, as was said, the sun himself became the artist, and some of the delineations, with all their wonderful delicacy of detail, were exhibited. At the same time Daguerre made a public exhibition of numerous pictures produced by what he termed the 'Méthode Niepce perfectionnée.' An examination of the merits of the new method was, at the suggestion of M. Arago, promptly ordered by the French government to be made, and in consequence of the favourable nature of the report, M. Daguerre was in June 1839 nominated an Officer of the Legion of Honour; and the project of a law was on the same day presented to the Chambers—by whom it was readily adopted—which accorded to M. Daguerre, on condition of the full publication of his method, an annuity for life of 6000 francs, and one of 4000 francs to the representative of M. Niepce. [NIEPCE.] The rapid extension and improvement of the process of Daguerre (or the Daguerreotype, as it soon came to be generally called) after its being thus freely made public property, was due perhaps more to others than to M. Daguerre, who however never ceased to labour at its improvement during the remainder of his life. He died July 12th, 1851, at Petit-Brie-sur-Marne, where a handsome monument has been erected by subscription to his memory.

M. Daguerre is the author of two short works—'Histoire et Description des procédés du Daguerreotype, et du Diorama,' 8vo, Paris, 1839; and 'Nouveau Moyen de préparer la couche sensible des plaques destinées à recevoir les images photographiques,' 8vo, Paris, 1844.

(Arago, *Rapport à l'Académie des Sciences*; A. de Lacaze, *art. Daguerre in Nouv. Biog. Gen.*; and the various historical notices of the Daguerreotype and Photography.)

DAHL, JOHANN CHRISTIAN, one of the most eminent of the modern German school of landscape painters, was born at Bergen in Norway, February 24th, 1778. He was originally designed for the church, but on reaching manhood abandoned the study of theology for that of art, to which he had been inclined from childhood. In 1811 he went to Denmark; some years later he removed to Berlin; and he then proceeded to Rome, where he enjoyed the friendship and advice of Bartholdy and Thorwaldsen. Since 1821 he has resided at Dresden; he has been largely patronised by the court and leading admirers of art in Denmark, and has seen his reputation extend throughout Germany, and his pictures find purchasers among the collectors of England and America. Dahl has painted many views of Italian and Tyrolean scenery, and not a few landscape compositions; but it is by his representations of the remarkable scenery of his native country that he is best known, and on them his fame will depend. To an eye accustomed to the rich colouring of the Italian masters and the freshness of that of the English landscape painters, there is much that is unsatisfactory in the colouring of Dahl's land-

scapes, and there is also a good deal of mannerism in their general style, yet the wild grandeur of Norwegian scenery has probably by no one else been so extensively and well painted, or under such various aspects. The coast and marine views of Herr Dahl are by many of his admirers more highly esteemed than even his rock and forest scenery.

DAHL, MICHAEL, a Swedish portrait-painter, was born at Stockholm in 1656, was taught painting by Ernstsen Klocke, and came to England in 1678. He went about a year afterwards to Paris, where he remained a year; and from thence to Italy, where he spent three years in its principal cities. In 1688 Dahl came again to England, where he had a very successful career. During the reigns of Anne and George I., Dahl was the principal rival of Sir Godfrey Kneller. Walpole mentions, among other works by Dahl, a portrait of his mother at Houghton, which he says possessed great grace. There is an equestrian portrait by Dahl, at Windsor, of Charles XI. of Sweden, and there are several portraits in the gallery of admirals at Hampton Court, and some whole-lengths of ladies at Petworth. He died in London in 1743, and was buried in St. James's church.

DAILLÉ, JEAN, was born at Châtelleraut in 1594, of a Protestant family. In 1612 he undertook the education of the two grandsons of Duplessis Mornay, the friend of Henri IV., and he travelled with them in several countries of Europe. At Venice he became acquainted with the famous Fra Paolo Sarpi. On his return to France he became pastor at Charenton in 1626. He published many works on divinity, both in Latin and French, and especially on controversial subjects; and was esteemed one of the most learned and powerful advocates of the Protestant doctrines in his time. His principal productions are:—*Traité de l'emploi des SS. Pères pour le jugement des différends de la religion*, Geneva, 1682, which was also published in Latin, with the title 'De Usu Patrum'; it is one of Daillé's best works and still much esteemed; 'De la croyance des Pères sur le fait des images'; 'Adversus Latinorum traditionem de religiosi cultus objecto'; 'De cultibus religiosi Latinorum.' These three last works attempt to prove, that in the early or primitive Christian church there was no religious worship paid to the host, to relics, crosses, images, &c. 'De confirmatione et extrema unctione'; 'De sacramentali sive auriculari Latinorum Confessione,' Geneva, 1661. This last work puts forth the strongest arguments against the practice of auricular or private confession. 'De scriptis quæ sub Dionysii Areopagite et Sancti Ignatii Antiocheni nominibus circumferuntur,' Geneva, 1666. Daillé, in this work, which exhibits much historical and critical learning, looks upon the works attributed to Dionysius and Ignatius, of Antioch, as apocryphal. 'De pænis et satisfactionibus humanis.' He also wrote an apology of the reformed churches and numerous sermons, which have been collected in several volumes, and also 'Dernières heures de Duplessis Mornay,' Leyden, 1647. Daillé died at Paris April 15, 1670. His son, Adrien Daillé, left France at the revocation of the Edict of Nantes, and retired to Zürich, where he wrote his father's life.

DALBERG, KARL THEODOR ANTON MARIA VON, was born on the 8th of February 1744, at Hemsheim. The barony of Dalberg was the oldest in Germany, and his father held high offices under the Archbishop-Elector of Mainz. Young Dalberg received a sound education at home, and when only fifteen was sent to the University of Göttingen, whence he removed to that of Heidelberg, where in 1761 he received the degree of LL.D. He then travelled for a while, and on his return resolved to devote himself to the clerical profession, for which purpose he studied theology and the canon law at Worms, Mannheim, and Mainz. He soon received ecclesiastical preferment, being made a prebendary of Mainz, and a canon of Würzburg and Worms. In 1772 he received the appointment of governor of Erfurt, and during his long continuance in that office distinguished himself highly by his judicious and benevolent conduct. He was unwearied in encouraging art, science, commerce, and agriculture; and the little town and district under his government flourished so remarkably as to testify to his capabilities for a higher situation. He maintained an intercourse during his whole life with the highest minds of Germany—Herder, Göthe, Wieland, Schiller, &c. His abilities and virtues attracted the attention of the Emperor Joseph and of Frederick the Great, by whose influence, in 1787, he was chosen coadjutor in the archbishopric and electorate of Mainz, to which, on the death of the archbishop in 1802, he succeeded, as also to the dignity of archchancellor of the empire. By the treaty of Luneville however the electorate was abolished, part of the territory surrendered to France, and the remainder secularised. In order to recompense him in some degree, the districts of Ratisbon, Aschaffenburg, and Wetzlar were assigned to him.

In 1804 Dalberg went to Paris to arrange with Pope Pius VII. the affairs of the German Roman Catholic Church, and to obtain, if possible, some milder terms from Napoleon. This journey brought him into ill repute with his countrymen, who, from the extreme complaisance he evinced, naming Cardinal Fesch as his successor, and becoming a corresponding member of the Institute, believed that he had sacrificed his country in order to forward his own preferment. He certainly became a favourite with Napoleon, who caused him to be made Prince-Primate of the Rhenish Confederation, and President of the Assembly of the States. In 1810 he surrendered the principality of Ratisbon to Bavaria, and Napoleon in consequence created him

Grand-Duke of Frankfurt, with a condition that Eugene Beauharnois, Napoleon's step-son, should be named his successor instead of Cardinal Fesch. Dalberg's grandeur however was very evanescent. In 1813 he was forced to renounce all his secular acquisitions, and withdraw himself to his spiritual duties as archbishop of Ratisbon, the only dignity he retained, and in that town he died on the 10th of February 1817.

Throughout his career Dalberg maintained his character for active benevolence. During his last residence at Ratisbon, notwithstanding his age, he fulfilled the duties of his office in an efficient and conscientious manner, relieving the poor, assisting the industrious, encouraging the good, and reproving the bad, alike by his example and his discourse, in which he was never severe or impatient. As a scholar his reputation was very high, and there were few branches of art or science of which he had not considerable knowledge. His writings were chiefly on subjects of practical philosophy and aesthetics, which a winning eloquence of style rendered very popular. The principal are, 'Betrachtung über das Universum' ('Contemplations of the Universe'), 1777; 'Grundsätze der Ästhetik' ('Principles of Aesthetics'), 1791; 'Von dem Bewusstsein als allgemeinem Grunde der Weltweisheit' ('Of the Memory as the General Foundation of Knowledge'), 1795; 'Von dem Einflusse der Wissenschaften und Künste in Beziehung auf öffentliche Ruhe' ('On the Influence of the Sciences and Arts with reference to the Public Quiet'), 1793; and 'Perikles, über den Einfluss der schönen Künste auf das öffentliche Glück' ('Pericles, on the Influence of the Fine Arts on the Public Prosperity'), 1806. He also contributed many valuable papers to various German periodical works.

DALBY, ISAAC, one of the many self-taught men of this country, who have attained considerable eminence in mathematical science by the mere force of genius, and in defiance of the obstacles opposed by fortune to their progress, was born in Gloucestershire, in the year 1744, and he appears to have been instructed in the rudiments of Latin and arithmetic at a grammar-school in that county. By his friends he was destined to be a clothworker, but his taste leading him to the study of mathematics, he laboured, by the aid of Stone's 'Euclid,' Simpson's 'Algebra,' and Martin's 'Trigonometry,' to qualify himself to be an usher in a country school. In that capacity he was employed for about three years, when he opened a school on his own account in another part of the country, but meeting with no success, he came up to London in 1772. Here he received the appointment of usher to teach arithmetic in Archbishop Tenison's grammar-school near Charing Cross, and while fulfilling the duties of that employment he became known to many of the most celebrated men of science in town. Among these were Dr. Maskeline, the astronomer royal, Dr. Hutton and Mr. Bonycastle, both of the Royal Military Academy at Woolwich, the Rev. Messrs. Crakelt and Lawson, and Mr. Landen, Mr. Wales, mathematical master of Christ's Hospital, and Mr. Witohel, master of the Royal Naval Academy at Portsmouth. Mr. Bayly, who had been employed in making astronomical observations in a building erected near Highgate by the Hon. Topham Beauclerk for philosophical purposes, being engaged to sail with Captain Cook, Dalby, after having been about a year at the school above mentioned, was appointed to succeed him. In this situation, besides his duties as observer and librarian, he performed, under Dr. Fordyce, that of experimenter in chemistry; and amidst these employments he found time to make himself acquainted with the French language and revive his knowledge of Latin. In 1781, Mr. Beauclerk's establishment being broken up, and the library, instruments, &c., sold, Dalby was engaged to make a catalogue of the library of Lord Beauchamp; and in the following year he was appointed mathematical master of the Naval School at Chelsea. This was supported by voluntary contributions, and it succeeded for a time under the management of Mr. Jonas Hanway; but the subscriptions falling off, the institution was given up.

In 1787 Mr. Ramsden, the distinguished maker of philosophical instruments, to whom for several years Dalby had been known, recommended him, as an assistant, to Major-General Roy, who was then employed in the trigonometrical observations for connecting the meridians of Greenwich and Paris; and during that and the following year he was employed in extending the triangulation through Kent and part of Sussex to the coast opposite France. Dalby was subsequently employed in making the computations preparatory to the publication of the account of the proceedings; and on this occasion he was led to apply a theorem (ascribed to Albert Girard) to the purpose of computing the excess of the three angles of a spherical triangle above two right angles. The account was published in the 'Philosophical Transactions' for 1790; and in the volume for the same year is a paper by Dalby on the figure of the earth, in which it is proved that the 'excess' is, without sensible error, the same whether the earth be a sphere or a spheroid. General Roy died in 1790, and in the following year Dalby was engaged, together with Colonel Williams and Captain (since Major-General) Mudge, to carry on the survey of England. The operations commenced by a remeasurement of the original base on Hounslow Heath, and before Mr. Dalby quitted that service the triangulation was extended through the southern counties of England to the Land's End. The accounts of the survey were published in the 'Philosophical Transactions'; but in 1795 Dalby, together with Colonel Mudge, made a revision of General Roy's papers, and connected the operations of that officer with those which

had subsequently taken place to the end of 1796: these form the subjects of a volume which was published separately.

In the year 1799, on the formation of the Royal Military College at High Wycombe, Dalby was appointed professor of mathematics in the senior department of that institution. He continued to hold that appointment during the years that the department to which he belonged remained at High Wycombe, and subsequently to its removal to Farnham in Surrey; but in 1820, it being then united to the junior department at Sandhurst in Berkshire, his infirmities obliged him to resign. He continued however to reside at Farnham till his death, which took place October 14, 1824, when he was in the eighty-first year of his age.

His attention to his duties was unremitting; and besides his contributions to the 'Ladies' Diary' and other works, he wrote for the use of the Military College, a valuable 'Course of Mathematics,' in 2 vols., which, with successive improvements, extended to a sixth edition.

(Leybourn, *Mathematical Repository*, vol. v.)

D'ALEMBERT. [ALEMBERT, D.]

DALGARN, GEORGE. The following short notice of this original but neglected author is in Anthony-a-Wood's 'Athenæ Oxonienses,' vol. ii., p. 506. "The reader may be pleased to know, that one George Dalgarno, a Scot, wrote a book entitled 'Ars Signorum, Vulgo Character Universalis et Lingua Philosophica,' London, 1661. This book before it went to press the author communicated to Dr. Wilkins, who, from thence taking a hint of greater matter, carried it on, and brought it up to that which you see extant. This Dalgarno was born at Old Aberdeen, and bred in the university of New Aberdeen; taught a private grammar-school with good success for about thirty years together in the parishes of St. Michael and St. Mary Magdalen in Oxford; wrote also 'Didascalopophus, or the Deaf and Dumb Man's Tutor;' and dying of a fever on the 28th of August 1687, aged sixty, or more, was buried in the north body of the church of St. Mary Magdalen." According to the above account, Dalgarno was born in or before the year 1627, and he must have been residing at Oxford in the year 1657; whether previous to that time, it does not appear, but it may not be erroneous to conclude that he went to Oxford to avail himself of the advantages of that seat of learning. From the works which Dalgarno left behind him, it may be concluded that he was a man of original talent, and of great acquirements; his speculations concerning a universal language, a favourite subject with the learned men of his time, undoubtedly preceded those of Bishop Wilkins, at that time dean of Ripon, and he received the testimony of Dr. Seth Ward, the bishop of Salisbury, Dr. John Wallis, and others, that he had discovered a secret "which by the learned men of former ages had been reckoned among the desiderata of learning." We have carelessly sought for some acknowledgment of the merits of Dalgarno in the 'Essay towards a Real Character' of Bishop Wilkins, but his name is not once mentioned, though assistance from Dr. Ward and others is noticed. Wilkins's work was published in 1663. Its appearance had been delayed for two years in consequence of the whole impression, when nearly printed, with the exception of two copies, having been destroyed in the great fire of London. Allowing for this delay, Dalgarno's work had the priority by several years, and Dr. Wilkins had the advantage of seeing it "before it went to press." This treatise, 'Ars Signorum,' &c., exhibits a classification of ideas, and a series of arbitrary signs or characters adapted to the classification, so as to represent each idea by a specific character, without reference to any language of words. All those persons who are acquainted with the 'Essay' of Wilkins will see the germ of it in this design of Dalgarno's. The 'Didascalopophus' develops views on the instruction of the deaf and dumb, both comprehensive and practical. It is a truly philosophical guide, by which the writer shows how capable the deaf and dumb are of understanding and applying a written language, and of their capacity to speak and to understand the speech of other persons. He shows that the art of teaching this class of persons requires the exercise of common sense, perseverance, and ordinary patience, under a teacher, fertile in expedients, and one who is able to turn even disadvantages and difficulties to a good account. Dalgarno's style is quaint and pedantic, and rather abounds with long and technological words, which serve to exhibit the learning of the author more than to increase the perspicuity of his work. But this was the garb which learning too often assumed in his day. To Dalgarno is due the credit of inventing what is perhaps the first manual alphabet for the use of the deaf and dumb, and the one from which the two-handed finger-alphabet now in use has probably been derived. As few copies of his work are now to be met with, we shall give his hand-alphabet, and accompany it by as much of his own explanation as seems necessary for understanding his views on dactylology. "After much search and many changes, I have at last fixt upon a finger or hand-alphabet according to my mind; for I think it cannot be considerably mended, either by myself or any other (without making tinker's work), for the purposes of which I have intended it; that is, a distinct placing of and easy pointing to the single letters; with the like distinct and easy abbreviation of double and triple consonants.

"The scheme (I think) is so distinct and plain in itself, that it needs not much explication, at least for the single letters, which are as

distinct by their places as the middle and two extremes of a right line can make them. The rules of practice are two:—1. Touch the places of the vowels with a cross touch with any finger of the right hand. 2. Poyut to the consonants with the thumb of the right

hand. This is all that I think to be needful for explaining the scheme, so far as concerns the single letters." Dalgarno's works were privately reprinted by Lord Cockburn and Mr. Thomas Maitland, and presented to the Maitland Club of Glasgow.

* DALHOUSIE, JAMES ANDREW BROWN RAMSAY, tenth Earl and first Marquis of, was born in 1812. His father was a general in the army, employed in the Peninsular war and at Waterloo, was for a time governor of Canada, and commander of the forces in India from 1828 to 1832. James was the third son by the heiress of the Brouns of Colstoun in Haddingtonshire. He was educated at Harrow, and subsequently at Christchurch, Oxford, where he was fourth class in classics (1833), and graduated M.A. in 1838. By the deaths of his elder brothers he became Lord Ramsay in 1832, and in 1834 he strove for a seat in the House of Commons, contesting Edinburgh against Sir John Campbell, now Lord Campbell, and James Abercrombie, afterwards speaker of the House of Commons and Lord Dunfermline. He was unsuccessful then, but in 1837 he was returned for the county of Haddington. In 1838, on his father's death, he was called to the House of Lords, where he showed great attention to business details, but did not distinguish himself as a speaker. He first entered official life in 1843, during the ministry of Sir Robert Peel, to whom his business habits had recommended him. He was appointed Vice-President of the Board of Trade, and in 1844 became President of the same department. In these offices he actively investigated all the details of the railway system, made himself acquainted with the financial and practical management of railways, and framed regulations for the conduct of the numerous bills that were pressed upon parliament during the railway mania of 1844-45. His reforms and improvements in the Board of Trade had been so extensive and so judicious, that on the accession of Lord John Russell to office in 1846, Lord Dalhousie was requested to retain his position, with which request he complied.

Towards the close of 1847 Lord Hardinge was re-called from India, and the governor-generalship of that country was offered to Lord Dalhousie. He went to India with a plan of action already formed on certain principles, and to those principles he firmly adhered during the eight years of his government. He felt that the pacific policy of his predecessors had not succeeded, and that situated as India was, it required to be ruled by a firm and uncompromising hand. When he entered on the government of that country peace prevailed. But a long continuance of peace could scarcely be expected among 120 millions of subjects, between whom and ourselves conflicting interests and the variety of caste and opinion are apt to raise constant hostilities and feuds. On reaching Calcutta, Lord Dalhousie lost no time in proclaiming his policy: "We are lords paramount of India, and our policy is to acquire as direct a dominion over the territories in possession of the native princes, as we already hold over the other half of India." Soon after his arrival, news was brought that British officers were murdered at Mooltan, and that Moolraj was in revolt; Lord Dalhousie marched a force into the north-western provinces, defeated the Sikhs and Afghans, and annexed the Panjab to our dominions in the East. When little more than two years were passed, the government of India found itself involved in hostilities with Burmah, where British traders had been insulted by the officers of the King of Ava. Remonstrance proving useless, Lord Dalhousie

despatched an expedition against Pegu, and in a few weeks the entire coast of Burmah was in his hands. Finding that the King of Ava still refused our just demands, he ordered the British troops to occupy Pegu, and incorporated it with our dominions. This was effected at the close of 1852; from that time to the end of his administration our Indian empire enjoyed comparative peace. The rich districts of Nagpore, Sattara, Jhansie, Berar, and Oude were severally annexed to our possessions by Lord Dalhousie, either in consequence of the failure of rightful heirs among the native dynasties, or else to put an end to the cruelty and oppression which those princes exercised towards their own subjects. It is almost needless to add that the social condition of each of the annexed provinces has proportionably improved.

During this time great changes were effected by Lord Dalhousie in the government and civilisation of India, and in the development of its resources. A yearly deficiency in the revenue was converted into a surplus until the years 1853-54 and 1854-55, when, chiefly in consequence of the vast public improvements undertaken, there was a deficiency of nearly half a million. The shipping of India doubled in tonnage, a Legislative Council was organised, the civil service was thrown open to competition, the annual accounts were expedited, and prison discipline was improved under the superintendence of Mr. Thomason. A system of uniform cheap postage was also introduced by Lord Dalhousie; a large portion of the Peninsula intersected by railways, and all the large towns brought into immediate connection by means of the electric telegraph, laid down by Dr. O'Shaughnessy, 4000 miles having been constructed and placed in working order between November 1853 and February 1856. The manufacture of salt, the production of cotton, tea, and flax, the breeding of sheep, and the improvement of agricultural implements—none of these points were too trivial for Lord Dalhousie's attention. The development of the resources of the country in iron, coal, and other minerals, is a matter on which he bestowed peculiar care; and measures were also taken for the preservation of the forests, and for making their produce available. At the same time a new and uniform survey of the ceded districts was commenced, and the limits of subject states accurately defined. Irrigation on a large scale was effected in Scinde, Madras, and Bombay; the navigation of the Ganges, Indus, Nerbudda, and Burrampooter was improved; grand trunk roads were carried to Delhi, through the Panjab, and to Patna, and others made in Pegu and Scinde. A road is also being constructed from Hindustan to the frontiers of Tibet, commencing from the plains of the Sutlej; and another is in progress from Arracan over the Yomah ridge to Pegu. The most stupendous work however which signalled his government was the Ganges Canal, carried out by the skill and energy of Sir Proby T. Cautley. Under his vigilant authority also the department of public works was reformed throughout, and a college founded to train young men specially in civil engineering. Schools and colleges were established and placed under government inspection, and the education of female natives provided for. The most strenuous efforts were at the same time made for the eradication of the systems of Suttee and Thuggee, and the practice of infanticide. The condition of the European soldiers was likewise greatly improved. Provision was also made for both Protestant and Roman Catholic worship, on equal terms, and extensive changes were made in matters of criminal and civil justice. Lord Dalhousie was also the author of another important alteration in Indian administration: he required the government of each presidency, each lieutenant-governor, and the chief officer of every province, to send in to the governor-general an annual report of the chief events that occurred within their several jurisdictions, in order to test the progress made by the nation at large.

For his successes in the Panjab, Lord Dalhousie was raised to a marquise in 1849; and on his return to England in May 1856, with shattered health and a broken constitution, the East India Company settled on him a life pension of 5000*l.* a year. He had previously been appointed to the Wardenship of the Cinque Ports on the death of the late Duke of Wellington in 1852.

(Lord Dalhousie, *Minute*, reviewing his administration in India.)

DALLAWAY, REV. JAMES, was born at Bristol February 20, 1763. He was educated at the grammar-school, Cirencester, and at Trinity College, Oxford, where he became known by his talent for versification. He took his M.A. degree in 1784, but failed in being elected Fellow of his college on account, it is said, of some satirical verses he had written. For several years he served as curate, and whilst so acting became editor of 'Bigland's Collections for Gloucestershire,' and took the degree of M.B. at Oxford in 1794. About 1795 the Duke of Norfolk, to whom he had dedicated his 'Origin of Heraldry,' obtained him the appointment of chaplain and physician to the embassy at Constantinople, and on his return to England Mr. Dallaway published 'Constantinople, Ancient and Modern, with Excursions to the Shores and Islands of the Archipelago, and to the Troad,' 4to, 1797. Some years later he contributed to the 'Archæologia,' vol. xiv., a paper 'On the Walls of Constantinople.' In 1797 the Duke of Norfolk as Earl Marshal appointed Mr. Dallaway his official secretary, and in 1799 his grace gave him the rectory of South Stoke in Sussex, and in 1801 the vicarage of Leatherhead in Surrey. He resigned South Stoke in 1803 for the sinecure rectory of Slinfold. During his early years Mr. Dallaway devoted a good deal of attention to the subject of heraldry, and his first original publication was 'Enquiries into the

Origin and Progress of Heraldry in England,' 4to, 1792. He had before (1789) edited the 'Letters of Dr. Rundle, Bishop of Derry, to Mrs. Sandys.' Later he devoted himself to artistic and topographical antiquities. He published in 1800 'Anecdotes of the Arts in England, or Comparative Remarks on Architecture, Painting, and Sculpture;' in 1806 'Observations on English Architecture;' in 1816 'Statuary and Sculpture among the Ancients.' He edited in 1826 an edition of Walpole's 'Anecdotes of Painting' and the 'Letters and other Works of Lady Mary Wortley Montague, from her original Manuscripts, with Memoirs of her Life,' 5 vols. 8vo, 1806. He wrote also a 'Memoir' of Bishop Ridley; but the work by which he is best known, and one which will serve as the basis of the labours of any future historians of Sussex, is his 'History of Western Sussex,' of which the third part ('Rape of Bramber') was edited by the Rev. E. Cartwright. Mr. Dallaway was elected a Fellow of the Society of Antiquaries in 1789; and he contributed several papers to the Society's 'Archæologia;' he was also an occasional contributor to the 'Gentleman's Magazine,' the 'Retrospective Review,' &c. Both as an antiquary and a writer on art he belonged to the old school, and there is in all his writings a great want of precision, depth of research, and reach of thought. He died at Leatherhead in 1834.

DALRYMPLE FAMILY. The surname of this family is derived from the lands of Dalrymple, in the shire of Ayr, of which, in remote times, the chief of the house was proprietor. The family appears to have been of importance very early, for in the reign of King Robert III., Duncan Dalrumpill had a charter of the office of Tschedorach (or principal executive officer of the crown) in Nithsdale; and in 1462 James de Dalrymple was clericus regis.

The lands of Stair, whence the viscounty and earldom are derived, came into the family by William de Dalrymple, who became possessed of them in the middle of the 15th century by his marriage with his relation, Agnes Kennedy, heiress of the estate. The son of these parties married a daughter of Sir John Chalmers, of Gadgirth, in the same shire, whose first ancestor had held the high office of chamberlain of Scotland; and in lineal descent from him was James Dalrymple of Stair, who married Janet, daughter of Kennedy of Knockdaw, and by her had

JAMES DALRYMPLE, first Viscount Stair. He was born in May 1619, at Dummarchie, in the parish of Barr, county of Ayr, and lost his father before he had attained his fifth year. At that tender age he was left under the guardianship of his mother, who survived her husband upwards of thirty years. His early education was acquired at the school of Mauchline, whence, at the age of fourteen, he was removed to the college of Glasgow, where, applying himself closely to his studies, he qualified himself for taking the degree of A.M. in 1637. He left college the following year, and at the breaking out of the civil war obtained a captain's commission in the Earl of Glencairn's regiment. About this time the chair of philosophy in the University of Glasgow became vacant, and having, by the advice of some of the professors, become a candidate, he was in 1641, being then twenty-two years old, appointed to the place after a comparative trial. It was then the practice for every regent (as the professors appointed by the crown were called) to swear at taking office that he would demit on his marriage. This Dalrymple did, and having in 1643 married Margaret Ross, co-heiress of the estate of Balnail in Wigton, he resigned the chair, but was soon afterwards re-appointed. In this place he sedulously pursued his studies, and particularly the study of the civil law, with the view to the profession of the law, in which a knowledge of the Roman jurisprudence was then of great moment. In 1647 he resigned his chair, removed to Edinburgh, and after the usual trials, was admitted an advocate on the 17th of February 1648. The following year he was appointed secretary to the commissioners sent by the Scottish parliament to treat with Charles II., then an exile in Holland, for his return to his native dominions. He held the same office in the more successful mission of 1650, and was on that occasion particularly noted for his "abilities, sincerity, and moderation." During the Protectorate he was warmly recommended to Cromwell by General Monk, as a fit person to be one of the judges of the court of session, and on the 1st of July 1657, Dalrymple took his seat on the bench. At the Restoration he went to London with the Earl of Cassilis to pay his respects to the king. On that occasion the honour of knighthood was conferred upon him; and by letter, dated Whitehall, 14th February 1661, he was also nominated one of the lords of session. But refusing to sign the declaration enacted in 1660, his place was declared vacant 14th of January 1664. Having some time after waited on the king in London, his majesty allowed him to qualify his subscription to the Declaration, and restored him to his seat. He was created a baronet in June 1664; and on the resignation of Sir John Gilmour, he was appointed president of the court of session 7th of January 1671. On the 28th of February 1672, his eldest son, John, was admitted an advocate before the court; on the 25th of June 1675, his next son, James, was admitted; and his third son, Hew, on the 23rd of February 1677. Dalrymple continued president till the year 1681, when, on account of his conduct on occasion of the Test Act, he was superseded, and found it necessary to retire into Holland. In 1681 he published his 'Institutions of the Law of Scotland,' the work of a great and philosophic mind, but one deeply imbued with the principles of the Roman jurisprudence: it

gave consistency to the body of Scots law; and till our own day has guided the determinations of the Scottish lawyers. From his retirement at Leyden he transmitted to the Edinburgh press his 'Decisions of the Court of Session from 1661 to 1681;' the first volume appearing in 1684, and the second in 1687. And in 1686 he published at Leyden his 'Philosophia Nova Experimentalis.' He also busied himself about this time on a work relating to the mutual obligations of the sovereign and his people, but it was never published. On the accession of King James II., Dalrymple's eldest son was appointed lord advocate of Scotland in the room of Sir George Mackenzie; and in this place he had influence enough to procure a pardon for his father, who, on the testimony of Spence, the secretary of Argyll, had been prosecuted and outlawed for his alleged concern in the Rye-house Plot. Sir John held the situation of lord advocate for about twelve months, when he was appointed successor to Foulis of Colinton, both as lord justice clerk and as an ordinary lord of session. His father, on coming over to this country with the Prince of Orange, with whom he had been much in favour while in Holland, was reinstated in the presidency of that court; and on the 21st of April 1690, raised to the peerage by the style and title of Viscount Stair. The same year Sir John was re-appointed lord advocate; and the next year advanced to be one of the principal secretaries of state, in which latter place he continued till the year 1695, when he was driven from office upon the parliamentary inquiry into the equally impolitic and barbarous massacre of Glencoe, of which he appears to have been the chief instigator.

Stair died in the end of the same year, on the 23rd of November 1695, shortly after the publication of his work entitled 'A Vindication of the Divine Perfections,' and was buried in the high church of Edinburgh. He was succeeded in his title and estate by his eldest son, who on the 8th of April 1703 was advanced to be Earl of Stair, and who died suddenly on the 8th of January 1707, after a warm debate that day on the 22nd article of the treaty of Union, which relates to the number and privileges of Scots peers. By his wife, daughter and heiress of Sir John Dundas of Newliston, in the shire of Edinburgh, he left a younger son, who was

JOHN DALRYMPLE, second Earl of Stair. He was born at Edinburgh on the 20th of July 1673, and in early youth had the misfortune to kill his elder brother by the accidental discharge of a pistol. For some years afterwards he was under the tuition of a clergyman in the shire of Ayr, whence he was at length restored to his father's house. In 1692 he entered as a volunteer under the Earl of Angus, commander of the Cameronian regiment at the battle of Steinkirk. His parents however appear to have been desirous of his adopting the profession of the law, and for that purpose sent him to Leyden; but on his return in 1701 from his travels he accepted a commission as lieutenant-colonel of the Scots regiment of Foot-guards. The year following he served as aide-de-camp to the Duke of Marlborough at the taking of Venlo and Liege, and the attack on Peer; and in the course of the year 1706 he successively obtained the command of the Cameronian regiment and the Scots Greys. On his father's death in the beginning of 1707 he succeeded to the earldom of Stair, and was soon afterwards chosen one of the representative peers of Scotland in the united parliament. In the subsequent victories of Oudenarde, Malplaquet, and Ramillies, he held high command and obtained great distinction; but on the accession of the new ministry in 1711, when the career of Marlborough was stopped, he sold out of the Scots Greys, and retired from the army. When George I. succeeded to the throne the Earl of Stair was appointed a lord of the bedchamber and a privy councillor, and in the absence of the Duke of Argyll was constituted commander-in-chief of the forces in Scotland. The next year he was sent on a diplomatic mission to France; and it would seem that the embassy was distinguished by much skill and address, and at the same time by remarkable splendour and magnificence. He was recalled in 1720, and for the next twenty-two years lived in retirement at his seat at Newliston, where it is said he planted various groups of trees in a manner designed to represent the arrangement of the British troops at one of the victories he had been engaged in. He also turned his attention to agriculture, and was the first in Scotland to plant turnips and cabbages in the open fields. On the dissolution of the Walpole administration in 1742 he was recalled to public life, and served in a military capacity on different important occasions till his death, which happened at Queensberry House, Edinburgh, on the 9th of May 1747. He left a widow, but no children.

His next brother, William Dalrymple of Glenmure, who was a colonel in the army, married Penelope, countess of Dumfries, and their issue succeeded to the earldom. His youngest brother, George Dalrymple of Dalmahoy, passed advocate, and on Baron Smith's advancement to the chair was made a puisne baron of Exchequer, in which situation he continued till his death in July 1745. More lately there was on the bench of the same court a member of another branch of the same family, Sir John Dalrymple of Cranston, Bart., who was appointed in 1776 one of the barons of the Exchequer, and so continued till the year 1807, when he resigned. He was the author of 'Memoirs of Great Britain,' 'Tracts on Feudal Law,' and other publications. He was descended from James, second son of the first Viscount Stair, who was author of 'Collections concerning Scottish History preceding the Death of David I.,' and who was created a

baronet on the 28th of April 1698, the day previous to his younger brother, *Hew Dalrymple* of North Berwick, being raised to the like dignity.

SIR HEW DALRYMPLE, born in 1652, was some time one of the commissaries of Edinburgh, having been appointed to that place on the resignation of his brother James, when the latter was made one of the principal clerks of session. He had also been some time dean of the Faculty of Advocates; and was, on the occasion of his being created a baronet, promoted at once from the outer bar (like the predecessor of his father, Sir George Lockhart, and in more recent times Mr. Blair, the only instances in the history of the court) to the presidency of the Court of Session, which had remained vacant since his father's death in 1695. President Sir Hew Dalrymple collected the decisions of the court from his appointment till the 21st of June 1720, and continued in the chair till his death, which took place on the 1st of February 1737, in the eighty-fifth year of his age.

He had a younger son of the same name with himself, *Hew Dalrymple*, who passed advocate on the 18th of November 1710, and in December 1726 was made a lord of session under the titular designation of Lord Drummore. He was also some time afterwards appointed a lord of justiciary on Erskine of Dun's resignation, and died in the possession of both offices in June 1755, with the character of an acute and learned lawyer, and a very honourable man. By his wife, Anne Horn, heiress of the estates of Horn and Westhall in the county of Aberdeen, he left a large family, one of whom was *David Dalrymple* of Westhall, who passed advocate in the beginning of 1743, in the twenty-third year of his age, and in 1746 was chosen procurator (or advocate) to the Church of Scotland. In 1748 he was also constituted sheriff depute of the shire of Aberdeen, and he continued in both offices till July 1777, when he was made a lord of session under the title of Lord Westhall. His elder brother assumed his maternal surname of Horn, and marrying Mary, daughter and heiress of Sir James Elphinstone of Logie, assumed the additional surname of Elphinstone, and had by his wife a son, who on the 16th of June 1828 was created a baronet by the style and title of *Sir Robert Dalrymple Horn Elphinstone, Bart.*, of Horn and Logie Elphinstone. A younger branch of the same family had a few years before been raised to the like dignity in the person of *Sir Hugh Whiteford Dalrymple* of Highmark, in the county of Wigton, who was created a baronet on the 6th of May 1815.

The youngest son of the first Viscount Stair was *Sir David Dalrymple* of Hailes, Bart., so created on the 8th of May 1700. He passed advocate on the 3rd of November 1688, and in 1709 was appointed lord-advocate of Scotland in the room of Sir James Stewart, who was however reinstated in the office in the year 1711. On Stewart's death Sir David was again appointed lord-advocate, and continued till May 1720, when he was succeeded by Robert Dundas of Arncliffe, who also succeeded him on his decease, the following year, in his place of dean of the Faculty of Advocates. His eldest son was *Sir James Dalrymple* of Hailes, Bart., some time auditor of Exchequer; and by his wife, Lady Christian Hamilton, daughter of the sixth Earl of Haddington, the father of a numerous family. The eldest of these was the celebrated judge and antiquary,

SIR DAVID DALRYMPLE, better known by his titular designation of LORD HAILES, was born at Edinburgh on the 28th of October 1726, and after acquiring the rudiments of his education in his native place, was sent to Eton, where, with a competent degree of learning, he imbibed that classical taste, and partiality for the manners and customs of England, which distinguished the subsequent periods of his life. From Eton he returned to Edinburgh, whence, after passing through the usual course at the university there, he was sent to Utrecht to study the civil law; and on his return in 1746 he prepared for the bar, and passed advocate on the 24th of February 1748. After eighteen years of professional life he was raised to the bench of the Court of Session; and ten years after he was also, on the resignation of Lord Coalston, to whose only daughter he was married in October 1763, appointed a lord of justiciary. As a judge, his accuracy, diligence, and dignity were eminently conspicuous; but it is on the broader basis of literary merit that his great fame rests. The earliest of his publications appears to have been sacred poems, being a collection of translations and paraphrases from Scripture by various authors, Edinb., 1761. His next was the 'Wisdom of Solomon and the Book of Ecclesiastes,' 1755. The same year he wrote in 'The World' Nos. 140 and 147, and the next year No. 204, in which year also he published 'Select Discourses,' by John Smith of Cambridge, with a preface and learned notes. The year following, 1757, he republished, with notes, 'A Discourse of the unnatural and vile Conspiracy attempted upon the King by the Earl of Gowry.' In the month of October 1761, two vessels being wrecked on the shore between Dunbar and North Berwick, and pillaged by the country people, Sir David published a sermon from Acts xxviii. 2—"The barbarous people showed us no little kindness." In 1762 he published from the press of Foulis of Glasgow, 'Memorials and Letters relating to the history of Britain in the reign of James I. of England,' with a preface and notes. From the same press, in 1765, he published the 'Works of the ever memorable Mr. John Hailes, of Eton,' in three vols.; and the same year at Edinburgh the first specimen of a book entitled 'Ane compendious booke of Godly and Spiritual Songs.' The year following he published 'Memorials and Letters relating to

the history of Britain in the reign of Charles I., from the originals collected by Wodrow; an 'Account of the Preservation of Charles II. after the battle of Worcester,' drawn up by himself; and the 'Secret Correspondence between Sir Robert Cecil and James VI.' The next year he published a catalogue of the lords of session from the institution of the court, with historical notes; and the following year 'The Private Correspondence of Bishop Atterbury and his Friends in 1725.' In 1769 he published, first, 'An Examination of some of the arguments for the high antiquity of the Regiam Majestatem, and an inquiry into the authenticity of the Leges Malcolmi;' 'Historical Memoirs concerning the provincial councils of the Scottish clergy, from the earliest account to the æra of the Reformation;' and third, 'Canons of the Church of Scotland, drawn up in the provincial councils held at Perth in the years 1242 and 1269.' And in 1770 he published some ancient Scottish poems from manuscripts, with a number of curious notes and a glossary. His next performance was the additional case of Elizabeth, claiming the title of Countess of Sutherland: a singularly able paper, which was subscribed by Alexander Wedderburn, afterwards Lord Chancellor of England, and Sir Adam Ferguson, but well known to be the work of Lord Hailes. In 1773 Sir David published 'Remarks on the History of Scotland;' and in 1776, 'Letters from Hubert Languet to Sir Philip Sydney.' This last year also he published his 'Annals of Scotland, from the time of Malcolm Canmore to King Robert I.;' 'Tables of the succession of the Scots Kings' during the same period; and in 1779 his 'Annals of Scotland, from the accession of Bruce to the accession of the House of Stuart.' In the above year, 1776, he published another work of much erudition; namely, 'An account of the Martyrs of Smyrna and Lyons in the second century,' with notes. This was intended as the first volume of 'Remains of Christian Antiquity;' the second volume of that work appeared in 1778, and the third in 1780. The next year he published 'Octavius,' a dialogue by Marcus Minucius Felix, with notes and illustrations; and the year following, the treatise by Lactantius of the manner in which the persecutors died, illustrated in like manner by various notes. In 1783 appeared his 'Disquisitions concerning the Antiquity of the Christian Church;' and in 1786, 'An inquiry into the secondary causes which Mr. Gibbon has assigned for the rapid growth of Christianity.' After this followed some biographical sketches, in separate works and at different times, but all intended as a specimen of a Biographia Scotica. In 1788 he published from manuscripts the opinions of Sarah, duchess of Marlborough; and in 1790 a translation of the address of Q. Septim. Tertullus to Scapula Tertullus, proconsul of Africa, with notes, to illustrate the state of the church in early times. This was the last work which Lord Hailes lived to publish. On the 29th of November 1792 he expired, in the sixty-sixth year of his age, the baronetcy, for want of male issue, descending to his nephew James, eldest son of John Dalrymple, Esq., some time lord provost of Edinburgh, who was brother of Sir David, and also brother of

ALEXANDER DALRYMPLE, the hydrographer. He was born at New Hailes, the seat of his father, Sir James Dalrymple, Bart., on the 24th of July 1737, and was the seventh son of a family of sixteen children, all of whom he survived. His scholastic education was very limited, partly from the troubles of the times, and partly from the early death of his father; and when scarce sixteen years of age he went abroad as a writer in the East India Company's service. Owing to his deficiency in the ordinary branches of learning, he was, on his arrival in India, placed under the storekeeper; but at length, through the kindness of friends, he was removed to the secretary's office, Lord Pigot himself giving him some lessons in writing, and Mr. Orme, the historian, instruction in accounts. In the records of the secretary's office he found certain papers on the subject of a commerce with the Eastern Archipelago; and so interested in the subject did he become, that, contrary to Lord Pigot's advice, he refused the secretaryship, and determined on a voyage among the eastern islands. He now also made himself master of the Spanish language by his own efforts, as he had a short time before done in regard to the French. In the course of the voyage he concluded a commercial treaty with the sultan of Sooloo; but not long afterwards the political affairs of that place were altogether changed, and no beneficial effects resulted from the enterprise. He subsequently returned to Sooloo, and re-established a friendly understanding between the inhabitants and the company; but unfavourable circumstances again intervened to prevent the results which were anticipated, and his exertions in England, whither he afterwards came on the same matter, were equally unfortunate. In 1769 the court of directors voted him 5000*l.* for his past services, equivalent to the emoluments of secretary at Madras, which he had relinquished in 1769 to proceed on the eastern voyage. From the time of his return to England in 1765, he employed himself in collecting materials for a full exposition of the importance of the Eastern islands and South Seas; and the court of directors, satisfied of the important information he possessed, employed him to draw up several charts of the Eastern seas, which were published under their authority. On Lord Pigot's appointment to be governor of Fort St. George in 1776, Dalrymple was reinstated in the service of the East India Company, and went out to Madras as a member of council and one of the committee of circuit; but in 1777 he was recalled with others, under a resolution of the general court, to have their conduct

inquired into, though nothing appears to have been done thereupon. Two years afterwards he was appointed hydrographer to the East India Company; and in 1796, when the admiralty at last established the like office, it was given to Dalrymple, to whom it had been promised when its establishment was first proposed nineteen years before. This place he retained till 1808, when the admiralty, having called for his resignation on the ground of superannuation, he refused to resign and was dismissed. A month later, June 19, 1808, he died, it is said from vexation. He left a large library, and rich particularly in works on navigation and geography, a few of which were purchased by the admiralty, and the remainder were sold by auction. His own works amount to about sixty in number; many of them undoubtedly valuable, but some also of a merely personal and transitory character. A list of them is appended to a memoir of the author, furnished by himself, in the 'European Magazine' for November and December 1802.

DALRYMPLE, JOHN, was born in the year 1804 at Norwich, where his father was a surgeon in general practice. He studied his profession under his father, in Edinburgh, and in London. He commenced practice as a surgeon in London in 1827. During the latter part of his career he devoted himself entirely to ocular surgery. He died in 1852. As a surgeon-oculist he was best known for his work on the 'Anatomy of the Human Eye,' which was published in 1834. He was not however known only as a surgeon, but also as a naturalist and accurate microscopic observer. Amongst his papers on these subjects the following are the most important: 'On a peculiar structure in the eye of Fishes,' published in the 'Magazine of Natural History,' sect. 2, vol. ii.; 'On the Vascular Arrangement of the Capillary Vessels of the Allantois and Vitelline Membranes in the Incubated Egg' ('Transactions of the Microscopical Society,' vol. i.); 'On the Family of *Closterina*' ('Annals of Natural History,' vol. v.) In 1849 he read a paper before the Royal Society on a hitherto undescribed infusory animalcule allied to the genus *Notornumata* of Ehrenberg. This paper was interesting as confirming the discovery of the sexuality of the rotiferous animalcules, which had been made by Brightwell. This paper was published in the 'Philosophical Transactions,' and in 1850 he was elected a Fellow of the Royal Society.

Mr. Dalrymple was one of the surgeons of the Royal London Ophthalmic Hospital. He was a Fellow of the Royal College of Surgeons of England, and in 1851 was elected a member of the council of that body.

DALTON, JOHN, was born September 5, 1766, at the village of Eaglesfield, near Cockermouth in Cumberland, where his father, Joseph Dalton, was the owner and cultivator of a small copyhold estate. John Dalton attended a school kept by John Fletcher, a Quaker, till he was twelve years of age. In his thirteenth year he himself began to keep a school at Eaglesfield, but he gave occasional assistance to his father in the farming operations. In 1781, when he was fifteen, he removed to Kendal, in order to become an usher in the school of his cousin George Bawley. Dalton, for two or three years before he left Eaglesfield, had been kindly noticed and assisted in his studies by Mr. Robinson, a man of property; and a similar good fortune attended him at Kendal, where he obtained the friendship of Mr. Gough, a blind gentleman who was devoted to the study of natural philosophy, and who, besides the use of his library, afforded Dalton the advantage of his instruction and conversation. Dalton continued in his situation of usher till 1793, when Mr. Gough having been asked to name a person fit to become professor of mathematics and natural philosophy in the New College, Mosley-street, Manchester, recommended Dalton, who was accepted, and immediately removed to Manchester, which became his place of permanent residence during the rest of his life. The college was removed to York in 1799, when Dalton withdrew from it, and began to give lessons in mathematics and natural philosophy at his residence in Manchester, as well as at private seminaries. He afterwards delivered public lectures, of which the first course was given in the rooms of the Literary and Philosophical Society of Manchester, and consisted of twenty lectures on experimental philosophy; he subsequently gave lectures at London, Leeds, Birmingham, and other places in England and Scotland. He had filled for several years the situations of secretary and vice-president of the Manchester Literary and Philosophical Society, of which he had become a member in 1794; in 1817 he was elected president, and was re-elected every year till his death.

In 1822 Dalton paid a visit to Paris, with a single introduction, which was to Breguet the eminent watchmaker; next day he received an invitation from La Place, by whom he was introduced to the most distinguished scientific and literary men in Paris. Before this time however Dalton had published his most important discoveries in natural philosophy and chemistry; his merits were consequently well known to the French chemists, and they became more and more highly appreciated in England during every succeeding year of his life.

George IV. having, in 1826, given 100 guineas to the Royal Society of London for the purchase of two gold medals to be given to persons who had most distinguished themselves by discoveries in science, the first medal was unanimously awarded by the council to Dalton. He attended at York in 1831 the first meeting of the British Association for the Advancement of Science, and was the object of general respect and admiration; at the second meeting at Oxford in 1832 the Univer-

sity conferred on him the title of Doctor of Civil Law; at the third meeting at Cambridge in 1833 Professor Sedgwick, after pronouncing an eulogium on his character, announced that William IV. had granted him a pension of 150*l.* a-year; at the fourth meeting in Edinburgh in 1834 the University of Edinburgh conferred on him the degree of LL.D., and the Royal Society of Edinburgh elected him a member. In 1836 his pension was raised to 300*l.* a-year. Besides the honours conferred upon Dr. Dalton during the meetings of the British Association, his friends in Manchester in 1833 subscribed 2000*l.*, and employed Chantry to execute a statue of him in marble, which is now in the entrance-hall of the Royal Manchester Institution.

On the 10th of April 1837, Dr. Dalton, then in his seventy-first year, had a severe attack of paralysis, and another slight attack on the 21st; his right side was paralysed, he was deprived of the power of speaking, and his mind appeared to be in some degree affected: after an illness of some months his body and mind regained their powers, and his voice was restored, but his articulation was less distinct ever afterwards. On the 3rd of May 1844, Dr. Dalton had a third paralytic stroke, which affected his right side, and increased the indistinctness of his articulation. He partly recovered from the attack, and on the 19th of July attended a meeting of the council of the Manchester Literary and Philosophical Society, when he received a copy, engrossed on vellum, of a complimentary resolution passed at the annual meeting of the society. Being unable to articulate distinctly, he delivered a written reply. He died July 27, 1844. He had made his usual entry of meteorological observations, but with some symptoms of indistinctness of memory, before he retired to rest on the previous night. The inhabitants of Manchester expressed their estimation of his character by a public funeral. His body lay in state in the town-hall, and was visited by more than 40,000 persons in a single day. He was buried in the cemetery at Ardwick-green on the 12th of August. The funeral ceremony was conducted with great magnificence, and was attended by a vast concourse of persons.

Dalton, during his residence at Kendal, had occasionally contributed to 'The Gentleman's and Lady's Diary,' and in 1788 had commenced a series of meteorological records and observations, the first results of which he published soon after he went to Manchester, under the title of 'Meteorological Observations and Essays,' 8vo, 1793. He continued the habit of observing and recording the state of the atmosphere with the greatest regularity till the day before he died, taking several records daily; he had registered altogether upwards of 200,000 independent notices. His first essay in the 'Transactions of the Manchester Literary and Philosophical Society,' related to a peculiarity of his own sight—that of inability to distinguish certain colours—and was entitled 'Extraordinary Facts relating to the Vision of Colours, with Observations, by Mr. John Dalton.' It was read October 31, 1794, and is inserted in the 'Transactions,' vol. v., part 1. This peculiarity of vision has been since very generally designated Daltonism. In 1801 he published 'Elements of English Grammar,' London, 8vo.

In the 'Manchester Transactions' for 1802, part ii., there are six papers by Dalton, chiefly on subjects of meteorology, of which the most important is one called 'Experimental Essays on the Constitution of Mixed Gases; on the Force of Steam, or Vapour from Water and other Liquids, in different Temperatures, both in a Torricellian Vacuum and in Air; on Evaporation; and on the Expansion of Gases by Heat.' He discusses with great acuteness the difficult problem of the equal diffusion throughout each other of gases of unequal densities; and, besides other facts of importance, he proves that water, when it evaporates, is always converted into an elastic fluid or vapour, and that the elasticity of this vapour increases as the temperature increases; at 32° of Fahrenheit it balances a column of mercury about half an inch in height; at 212° it balances a column thirty inches high, or is equal to the pressure of the atmosphere. He determines the elasticity of vapour at all temperatures from 32° to 212°, points out the method of determining the quantity of vapour which exists at any time in the atmosphere, and determines the rate of evaporation from the surface of water at all temperatures from 32° to 212°. The principles laid down in these essays have been of the highest importance to chemists in their investigations respecting the specific gravity of gases, and have enabled them to solve many interesting problems.

Dalton began to work out his grand discovery of the atomic theory in 1803; in August 1804 he explained it distinctly and fully to Dr. Thomas Thomson, who was then on a short visit to Manchester; he touched upon it in a lecture before the Royal Institution of London in 1804, and subsequently in lectures at Manchester, Edinburgh, and Glasgow; but Dr. Thomson was the first to publish a short sketch of it in 1807, in the third edition of his 'System of Chemistry.' In 1808 Dr. Dalton published 'A New System of Chemical Philosophy,' 8vo, vol. i. In the first chapter he treats of heat; in the second, of the constitution of bodies, in which his chief object is to oppose the peculiar notions respecting elastic fluids which had been advanced by Berthollet and were supported by Dr. Murray of Edinburgh; in the third chapter, which occupies only a few pages, he gives the outline of the atomic theory. In a plate at the end of the volume he gives the symbols and atomic weights of 37 bodies, 20 of which were then considered simple, and the 17 others compound. In the second volume of his 'New System of Chemical Philosophy,' published in

1810, he treats of the elementary principles, or simple bodies, oxygen, hydrogen, azote, carbon, sulphur, phosphorus, and the metals; next he treats of the oxygen combined with hydrogen, azote, carbon, sulphur, and phosphorus; and of hydrogen combined with azote, carbon, sulphur, and phosphorus; finally, he treats of the fixed alkalies and earths. The table of atomic weights at the end of this volume, though more complete than the one he had given at the end of the first volume, is still very imperfect.

The atomic theory is undoubtedly one of the most important contributions which has ever been made to chemistry; and hardly less important were Dalton's attempts to determine the atomic weights of the different substances, though scarcely a single number was determined correctly. At the time when he made his discovery there was not a single chemical analysis which could properly be considered as correct; there was not a single gas whose specific gravity was known with any approach to accuracy; and Dalton displayed infinite sagacity at coming so near the truth as he did. Since the introduction of the atomic theory, the knowledge of chemical combination has been simplified to an amazing extent, and the processes of analysis, which constitute the essence of chemistry, have assumed a degree of accuracy almost approaching to mathematical precision. Manufactures have been benefited as well as science; the quantity of each constituent of any article can be regulated with perfect accuracy, so that there is no waste, and the result of the combination can be reckoned upon with unflinching certainty.

Dalton represented his atoms by symbols, as, for instance, oxygen by a circle, hydrogen by a circle with a dot, and other elements by similar simple figures. He considers that all bodies are composed of atoms, which, however small, have a definite size and weight. The symbols of oxygen and hydrogen placed together represented water, which he supposed to be composed of an atom of each; and other symbols were used in a similar manner. The atomic weights are the relative or combining weights, not the absolute weights. Assuming hydrogen to be the lightest body he called it 1; oxygen he determined to be 7, but it has since been ascertained to be 8. Dr. Wollaston has called oxygen 1; hydrogen then becomes .125. Dalton not only stated the general principle of combination in definite proportions, but he stated the chief laws of combination on which modern chemical analysis is based: 1, that the same compound consists invariably of the same constituents; 2, that the elements of every compound always unite in the same proportion by weight (and Guy-Lussac, in 1809, proved that gases unite in the same proportion by volume as well as by weight); 3, that, when any element combines in more proportions than one, those proportions are multiples—1, 2, 3, 4; 6, 12, 18, 24; 8, 16, 24, 32, and so on; 4, that, if two substances combine in a certain proportion with a third, they combine in exactly the same proportion with each other; 5, that the combining proportion of a compound is the sum of its constituents, as hydrogen 1 + oxygen 8 = water 9. Davy substituted the word proportion for that of atom, and Wollaston that of equivalent, which is now generally used; but whatever be the term, the meaning is the same, and in proportion as analyses have become more accurate, the laws which Dalton laid down have been more remarkably confirmed.

The third volume of Dalton's 'New System of Chemical Philosophy' was not published till 1827, but the greater part of it had been printed nearly ten years before. He treats of the metallic oxides, the sulphurets, phosphurets, carburets, and of the alloys. In the interval between the printing and publication, many of the facts had been anticipated by others, and some of them carried much farther. The most important part of the volume is the appendix, of about 90 pages, in which he discusses with his usual sagacity various important matters connected with heat and vapour. He gives a new table of atomic weights, much more copious than those contained in the two preceding volumes, and in which he introduces the corrections rendered necessary by the numerous correct analyses which had been made since the publication of the second volume.

Dr. Dalton's other works, which are tolerably numerous, are inserted in the 'Manchester Transactions,' 'Nicholson's Journal,' the 'Philosophical Transactions,' and the 'Philosophical Magazine,' and consist of experiments and observations on heat, vapour, evaporation, rain, wind, the aurora borealis, dew, and a variety of other physical subjects.

Dr. Dalton was of middle stature and strongly made. His face is said to have resembled the portraits of Newton. His power of mind was naturally strong; he was a patient observer, and an independent thinker, with the most perfect self-reliance, and with an extraordinary power of tracing the relations of physical phenomena; his experiments had rarely an insulated character, but were steps in some process of wide generalisation. By such a process, comparing the results of numerous experiments and numerous facts which had been established, he elicited order out of seeming confusion, and may truly be said to have become the legislator of chemistry, which before his time was little better than an experimental art—an accumulated mass of unconnected and imperfectly-developed facts. Dalton laid down the laws of the combination of substances, and at once advanced chemistry to the rank of a science. His moral character was worthy of his intellectual. He was a man of the strictest truth and honesty; independent, grave, reserved, but not austere; frugal, but not parsimonious. Unassuming, the honours which he received were voluntarily bestowed

upon him by those who were best able to estimate the value of his services to science and manufacturing industry; unostentatious, it was some time before his townsmen in Manchester were aware of his merits, but a small circle of friends appreciated him highly, and long before he received his pension offered to provide him with an independence that he might devote the whole of his time to science, but he declined to accept it, observing "that teaching was a kind of recreation, and that if richer he would probably not spend more time in his investigations than he was accustomed to do." His mode of life was singularly uniform. He was rarely from home except when he went to some place to lecture; he attended the meeting of the Society of Friends, of which he was a member, twice every Sunday; he went daily to his laboratory, of which the apparatus was of the simplest and indeed rudest kind; he played at bowls on the afternoon of every Thursday; and he paid an annual visit to his friends and the mountains in Cumberland and Westmoreland. He was never married.

Dalton was elected a Fellow of the Royal Society about 1821; he was elected a corresponding member of the Institute of France, and a few years later was enrolled a Foreign Fellow. He was also a member of the Royal Academies of Science of Berlin and Munich, and of the Natural History Society of Moscow.

(Thomson, *History of Chemistry*, vol. ii.; *Pharmaceutical Journal*, Oct. 1841; *Life and Discoveries of Dalton*, in *British Quarterly Review*, No. 1; *British Association Reports*.)

DAMASCE'NUS, JOANNES, was born at Damascus towards the end of the 7th or the beginning of the 8th century of our era. His father, Sergius, a wealthy Christian of Syria, was councillor to the kalif, and at his death John succeeded him in the same office. His father had given him for preceptor a monk named Cosmas, whom he had redeemed from slavery. About 728 he wrote several tracts in defence of image-worship against the Iconoclasts, who were then favoured by the emperor Leo the Isaurian. A legendary story is told of Leo having forged a treasonable letter from John to himself, which he contrived should come into the hands of the kalif, who sentenced John to have his right hand cut off, when the severed hand was restored to the arm by a miracle. About that time however John withdrew from the kalif's court to the monastery of St. Saba, near Jerusalem, where he passed the remainder of his life in ascetic practices and study. His numerous philosophical and theological works place him among the most distinguished writers of the Eastern Church in the 8th century. His principal work is an exposition of the 'orthodox faith,' or Christian doctrines, in four books, which unites the two systems of scholastic and dogmatic theology, the former being by ratiocination, according to the Aristotelian or scholastic method, and the second by the authority of the Scriptures and the fathers. This work attained great reputation in the Greek Church, and the author was styled Chrysorrhœas, or 'Golden-flowing,' on account of his eloquence. He promoted the study of Aristotle, and wrote various popular tracts, in which he collected and illustrated that philosopher's principles. He wrote also letters and treatises against heretics, especially against the Manichæans and Nestorians. His principal works have been published by Lequien, 'Opera J. Damasceni,' Paris and Venice, 1748, 2 vols. folio.

DAMASCE'NUS, NICOLA'US, a philosopher and historian of the age of Augustus, and the friend of Herod the Great, tetrarch of Judæa, is mentioned by Josephus, Atheneus, Eusebius, and others. He wrote various works in Greek, and among them one on universal history in 144 books, of which we have some fragments, 'N. Damasceni Historiarum Excerpta et Fragmenta quæ supersunt,' 8vo, Leipzig, 1804; and again in Paris, 1805, edited by D. Coray. He also wrote his autobiography, of which a considerable portion has been preserved by Suidas and Josephus; a life of Augustus; a life of Herod; some philosophical and some poetical works, none of which have come down to us. The best edition of the remains of N. Damascenus is that of J. C. Orelli, Leipzig, 1804, with a supplement published in 1811.

DA'MASUS I., the son of a presbyter, was elected Bishop of Rome after the death of Liberius, A.D. 366. A party among the clergy elected the deacon Ursinus in opposition to Damasus, and the people, who had then a share in the elections, being equally divided, the two parties fought in the streets and in the churches for several days. Ammianus Marcellinus (xxvii. 3), who gives an account of these disorders, states that 137 bodies of the slain were found in one day in the basilica of Sicinius alone. The same author draws a sad picture of the corruption of the clergy of Rome in that age, of their cupidity and luxury, which he contrasts with the modest bearing of some of the provincial clergy. In the Theodosian Code (b. xx.) there is an imperial constitution, which was issued about that time for the better discipline of the clergy, in which they are forbidden receiving legacies from widows and minors, frequenting the houses of matrons, cohabiting with women under the pretence of religion, &c. Damasus being acknowledged by the bishops of Italy, was confirmed by the Emperor Valentinian, who sent Ursinus into exile. The party of Ursinus however kept up disturbances in Italy for several years. Ursinus himself returned to Italy. A Jew having brought a charge of adultery against Damasus, the affair was tried by a council of bishops at Rome in 378, and Damasus was acquitted. The Emperor Gratian being appealed to, sent the Jew into exile, as well as Ursinus and several of his party.

Damasus held several councils for the purpose of condemning heretics, and especially the Arians, the Apollinarians, and the Luciferians. He also was requested by the eastern churches to decide disputes which had arisen among them, particularly on the subject of the election of Flavianus to the see of Antioch. Among the eastern bishops who repaired to Rome on that occasion was Epiphanius, bishop of Cyprus, accompanied by St. Jerome, who had acquired during his residence in Syria and Palestine a great reputation for theological learning. Jerome became intimate with Damasus, and is said to have acted as his secretary. It was not until the death of Damasus, which happened in 384, that Jerome finally returned to the east, where he died.

There are a few letters of Damasus which have been preserved by Theodoretus and St. Jerome. Other letters and verses, as well as a Liber Pontificalis, which have been published under his name, are now considered apocryphal. The church of San Lorenzo in Damaso at Rome has derived its name from him, as he is believed to have been the founder of a church on the spot where the present structure stands, and where he was buried. Damasus was one of the most learned and influential among the earlier bishops of Rome. He was succeeded by Symiacus.

DAMASUS II. (Poppo, bishop of Brixen) was elected pope in 1048, in the room of Benedict IX., who had been deposed by the council of Sutri for his misconduct. He died, twenty-three days after his election, at Palestrina, and was succeeded by Leo IX.

DAMIE'NS, ROBERT FRANÇOIS, was born in 1715, in a village of Artois, where his father had a small farm. He enlisted in the army, which he left at the peace, and went to Paris, where he engaged as a menial, first in the College of the Jesuits, and afterwards in several families: he was repeatedly turned out of his situation on account of misconduct. While he was unemployed he used to attend the great hall of the Palace of Justice, which was then the rendezvous of those who were styled Jansenists. At that time France was distracted by the long quarrel concerning the bull Unigenitus. [CLEMENT XI.] The parliament of Paris disapproved of the bull, although it had been forced by the court to register it. Several of the parish clergy expressed a similar opinion, and were on that account suspended from their functions by their bishops, who were in general favourable to the prerogatives of the court of Rome. The clergymen thus laid under interdict appealed to the parliament, which returned a decision favourable to them. Upon this the court and the bishops attacked the parliament, several of whose members were imprisoned by lettres de cachet. The supposed miracles of the Abbé Paris, brother of a councillor of parliament, and a sturdy opposer of the bull, excited the minds of the people, and created a sect of fanatics, called 'convulsionnaires,' or 'shakers.' The archbishop of Paris refused the sacraments, not only to the shakers, but to all those suspected of Jansenism, that is to say, opposed to the bull. The parliament issued arrêts to oblige the local clergy to administer the sacraments. The king cashiered these arrêts. The outcry now became general against the archbishop, the ministers, and the king; France was threatened with a schism and a war of religion. Louis XV. had then for his mistress Madame de Pompadour, who was generally disliked on account of her haughtiness and prodigality. All these complaints seem to have made a deep though confused impression on the excitable but ignorant mind of Damiens. Gautier, a servant of one of the councillors of parliament, acknowledged that he had heard him speak very violently in defence of the parliament, and against the archbishop of Paris. It would seem that Damiens was particularly irritated at the archbishop refusing the sacraments to so many people, and that he fancied that by killing or at least wounding the king he would effect a change in the system of government, and put down the archbishop and his party. However this may be, Damiens went to Versailles; and on the 5th of January 1757, about five in the afternoon, as Louis was stepping into his carriage, Damiens, who had made his way unobserved among the attendants, stabbed him on the right side with a knife. The wound was slight, and the king after a few days recovered. It is worthy of remark that the knife had two blades, of which Damiens used the shorter, which seems to confirm what he stated on his interrogatory, that he did not intend to kill the king, but only to frighten him and give him a warning. He did not attempt to run away, but was secured, examined, and put to the torture. He was afterwards removed to Paris, and committed for trial before the grande chambre of parliament, to which the king wrote a letter in which he demanded "a signal vengeance." Damiens was condemned as a regicide to be broken alive by four horses. The sentence was executed on the 28th of March 1757, on the Place de Grève. Before being put to death, he was tortured for one hour and a-half on the place of execution with red-hot pincers, molten lead, resin, wax, and other cruel contrivances. All the windows and roofs of the houses around were filled with spectators, men and women, among whom were many ladies of rank. It was altogether one of the most disgraceful exhibitions that ever took place in a civilized country. Damiens acknowledged no accomplices, and it does not appear that he had any. His crime was the act of a weak and disordered mind.

(Breton, *Pièces orig. et procéd. du procès fait à R. P. Damiens*, Par. 4to, 1757; *Vie de R. P. Damiens*, Par. 1757; *Histoire du Parlement de Paris*, 8vo, 1769; Voltaire, *Siècle de Louis XV.*; *Caveau Célèbres*.)

DAMPIER, WILLIAM, was born in 1652, of a Somersetshire

family; he went early to sea, served in the war against the Dutch, and afterwards became overseer of a plantation in Jamaica. He thence went to the Bay of Campeachy with other logwood cutters, and remained there several years. He kept a journal of his adventures and observations on that coast, which was afterwards published; 'Voyages to the Bay of Campeachy,' London 1726, with a 'Treatise on Winds and Tides.' Dampier, besides being a bold seaman, had also studied navigation as a science. In 1679 he joined a party of buccaniers, with whom he crossed the Isthmus of Darien, and having embarked in canoes and other small craft on the Pacific Ocean, they captured several Spanish vessels, in which they cruised along the coast of Spanish America, waging a war of extermination both by sea and land against the subjects of Spain. In 1684 Dampier sailed again from Virginia with another expedition, which doubled Cape Horn and cruised along the coasts of Chile, Peru, and Mexico, making depredations upon the Spaniards. From the coast of Mexico they steered for the East Indies, touched at Australia, and after several adventures in the Indian Sea, Dampier went on shore at Benocoolen, from whence he found his way back to England in 1691, when he published his 'Voyage round the World,' a most interesting account, and which attracted considerable attention. His abilities becoming known, he was appointed commander of a sloop of war in the king's service, and was sent on a voyage of discovery to the South Seas. Dampier explored the west and north-west coasts of Australia, surveyed Shark's Bay, and gave his name to a small archipelago east of North-west Cape. He also explored the coasts of New Guinea, New Britain, and New Ireland, and gave his name to the straits which separate the two former; on his homeward voyage he was wrecked on the Isle of Ascension. He at last returned to England in 1701, when he published the account of this voyage. In 1707 he published a 'Vindication of his Voyage to the South Seas in the ship St. George,' with which he had sailed from Virginia in his former marauding expedition. Dampier went to sea again till 1711, but the particulars of the latter part of his life are little known. He ranks among the most enterprising navigators of England. He was acquainted with botany, and was possessed of considerable information and general knowledge. His style of narrative is vivid, and bears the marks of truth. His voyages were published together in 3 vols. 8vo, London, 1697-1709.

*DANA, RICHARD HENRY, was born at Cambridge, near Boston, United States, November 15th, 1787. He completed his education at Harvard College, and was called to the bar; but after practising for a short time, he was compelled to abandon the legal profession by the state of his health, and he directed his attention to literature and politics. About 1817 he began to write a series of articles on the British poets in the 'North American Review.' His articles excited a good deal of attention, and he became associated in the management of the review; but in 1820 ceased to be connected with it. He then started on his own account a periodical called 'The Idle Man,' but its career closed with the completion of the first volume. In this work appeared his story of 'Tom Thornton,' which, when republished in a separate form, became very popular. In 1825 Mr. Dana wrote his first poem, the 'Dying Raven,' for the 'New York Review,' and the admiration it excited led him to publish in 1827 a volume entitled 'The Buccaneer, and other Poems.' The 'Buccaneer' never became what is termed popular; but its sterling excellence and fine manly tone obtained for it a circle of warm admirers. In 1833 Mr. Dana published a collected edition of his 'Poems and Prose Writings,' and a new edition in 2 vols., 8vo, appeared in 1850. Of late years Mr. Dana has written only miscellaneous essays and a few minor poems, most of which were incorporated in the last edition of his works. His only other public appearances have been as a lecturer on poets and poetry. He is however understood to be engaged in preparing for publication the papers of his brother-in-law, Washington Allston, the great American painter. Mr. Dana has written comparatively little, but his works are of a more finished character, and more sober in style and cast of thought, than is usual among his countrymen, and he is altogether one of her literary sons of whom America is justly proud.

The family of Dana is one in which eminent ability has been hereditary. For some generations his ancestors were noticeable men. His father FRANCIS DANA (born 1742, died 1811), an ardent actor in the Revolution, accompanied John Adams to Paris in 1779 as secretary of legation; in the following year he was appointed by Congress minister plenipotentiary to the court of Russia; and he subsequently became chief justice of Massachusetts. The son of the poet and essayist, *RICHARD HENRY DANA, Junior, is well known to the English public as the author of the remarkable work, 'Two Years before the Mast,' which has been several times reprinted in this country; he has also written 'The Seaman's Friend, a Treatise on Practical Seamanship,' of which the fourth edition was published at Boston in 1845. Mr. R. H. Dana, Junior, is now in good practice as a barrister at Boston. (Griswold, *Poets, and Prose Writers of America*.)

*DANBY, FRANCIS, A.R.A., was born at Wexford, Ireland, November 16, 1793. He received his earliest lessons in design in the School of Arts, Dublin, and exhibited his first pictures in 1812 at the exhibition in that city. In 1820 he removed to England, and took up his abode in Bristol. He sent some pictures to the Royal Academy

Exhibition in the following years; but it was not till 1824 that he obtained much notice, when a painting in the style which he has since made so familiar, entitled 'Sunset at Sea, after a Storm,' at once secured him a high place among the artists of his day. The picture was purchased by Sir Thomas Lawrence, at a price much above that which the obscure artist had ventured to place upon it; and this practical testimony of the president's admiration added no little to his popularity. Stimulated by his success, he the next year exhibited one of his largest and most elaborate paintings, 'The Delivery of Israel out of Egypt,' and the Royal Academy marked its sense of his ability by electing him in the same year an Associate. The next three years were the most productive in Mr. Danby's career as a painter, several of his most ambitious and best-known poetic and historical landscapes gracing the Academy walls during this period. In 1826 he exhibited 'Christ Walking on the Sea,' in 1827 'The Embarkation of Cleopatra on the Cydnus to meet Mark Antony,' in 1828 'The Opening of the Seventh Seal,' and a 'Scene from the Merchant of Venice.' His pictures were now looked for as one of the chief attractions of the annual exhibition, but his public career was suddenly brought to a temporary close. Some family matters caused him in 1829 to leave England, and he remained absent ten or twelve years, during which time he sent only one or two oil-paintings to the Exhibition. In 1841 he returned in full strength with his 'Morning at Rhodes,' 'The Sculptor's Triumph when his Statue of Venus is about to be placed in the Temple,' and an 'Enchanted Island.' These he followed up by a work of very ambitious character:—the 'Deluge,' a 'Holy Family,' the 'Contest of the Lyre and the Pipe in the Vale of Tempe,' 'St. Cloud in the Time of Louis XIV.,' 'The Painter's Holiday,' 'The Last Moment of Sunset,' 'The Tomb of Christ after the Resurrection,' 'The Fisherman's Home,' 'Winter Sunset,' 'Summer Sunset,' 'Ship on Fire—calm Moonlight—far at Sea,' 'Caius Marius amid the Ruins of Carthage,' 'Departure of Ulysses from Ithaca—Morning,' 'A Wild Sea-Shore at Sunset,' 'A Party of Pleasure on the Lake of Wallenstadt,' 'Evening—Dead Calm,' &c.

As the titles will have told, Mr. Danby's pictures are never mere delineations of a particular spot. Many of them are of the most ambitious class of poetic landscape; and they almost reach their lofty aim. His landscapes display considerable imagination, much poetic feeling, refinement, and rich and harmonious, though somewhat too monotonous colour. He delights especially in depicting the glories of the last moment of sunset, or the early twilight which succeeds it; and he bathes every object in the glowing atmosphere proper to that season. What he wants perhaps is something more of strength, fully to realise his intention; but as it is, he has marked out for himself a distinct path in the landscape art, and in it he has found no rival. Mr. Danby still holds only the same professional rank of A.R.A. which he held thirty years ago; but this is well understood to be, even with the Academy, no criterion of his real standing as a painter. His not having attained the honours of full membership has arisen from some of those private reasons which at times sway all close corporations and coteries. Mr. Danby has two sons, who have adopted the profession of painting; one of them, Thomas Danby, has acquired celebrity by some remarkably faithful pictures of English mountain scenery.

DANCE. There are two architects of this name, father and son. The elder **GEORGE DANCE** was architect to the Corporation of London, and erected in 1739-40 the Mansion House, a structure, which, although certainly far from being in the happiest or most refined taste, by no means deserves the obloquy that has been heaped upon it; for if in some respects uncouth, it is at all events a stately mass, and has a 'monumental' look. The elder Dance also built the churches of St. Botolph, Aldgate; St. Luke; and St. Leonard, Shoreditch. He died February 8th, 1768, and was succeeded in his appointment of City Surveyor by his eldest son,

GEORGE DANCE, JUN. (born in 1740), whose talent acquired for the family name far higher distinction. Not only trained up to architecture as a pursuit in which a safe and certain career, if not a brilliant one, was opened for him, he had applied himself to the study of it with a diligence exceeding what was required by the routine of that day, and he further possessed both a natural and cultivated taste for the fine arts generally, poetry included. He certainly stamped something of poetry, as well as energetic character, on the very first public work he executed; nor had he long to wait for the opportunity by which he signalled himself, for Newgate, the "proudest of prisons," was begun by him in 1770. This structure, one of the few truly monumental pieces of architecture in the metropolis, has been chiefly extolled for its striking degree of character; yet Newgate might have been equally prison-like in aspect had it been merely a dismal mass, utterly devoid of all æsthetic charm; it was by conferring upon it the latter—by breaking up the monotony of such a mass so as not at all to disturb unity, but enhance it—not to dissipate parts into littleness, but blend and condense them into one impressive whole—that Dance showed himself a great artist—let us say, a great tragic architect. Truly felicitous is the manner in which, by being divided into boldly distinct and well articulated parts, the composition acquires artistic play without losing anything of its severity. Truly felicitous also is the effective relief both as to perspective and light and shade thrown into it, not according to the usual practice of bringing parts forward, but of recessing them, and placing masses in the rear

of others, so that the general line of front is preserved unbroken in its lower part. The great drawback on this otherwise masterly composition is the centre compartment, or "governor's house." Well intended as is the kind of contrast between that part and the rest, the contrast actually produced is far from the happiest, the character given to the centre being by far too much like that of an ordinary dwelling-house, the windows being so many, in proportion to the space they occupy, as absolutely to crowd it and cut it up, to destroy breadth and repose, and to occasion an air of littleness. The attic story especially is a most paltry termination to the centre of such a pile; but in the original design the centre of the edifice was crowned by a pediment, which would have given variety to the whole composition, without any sacrifice of dignity: the alteration appears to have been made in order to provide an additional story, which however might just as well have been concealed within the roof. The proximity of Newgate perhaps deprived the late Giltspur Street Compter of some of the celebrity it might else have obtained as a piece of architecture; and yet the same proximity was not altogether favourable to the other, the fenestration in the design of the Compter being decidedly better than that of the governor's residence in Newgate. Dance derived much more fame from St. Luke's Hospital than from the Compter, though far less worthy of admiration: it is in fact a mere horrible reality without any æsthetic beauty infused into it. As to the front of Guildhall, erected by Dance in 1789, there can be but one opinion. Its ugliness we might tolerate, its absurdity we might excuse, but ugliness, absurdity, and excessive paltriness, without a single redeeming feature, combine to render it quite unendurable. Among Dance's minor works are the Shakspeare Gallery, Pall Mall, now the British Institution, and the Theatre at Bath, neither of which possesses any great beauty or merit.

Dance was not only one of the earliest members of the Royal Academy, but held for several years the office of Professor of Architecture; yet he never delivered any lectures, nor does he seem to have exhibited drawings at its exhibitions. Still if he neither lectured nor wrote upon that branch of art which he pursued as a profession, he gave the world evidence of his ability in a department of art wholly unconnected with architecture, by publishing a series of portraits (chiefly profiles) of the public characters and artists of the day, which appeared in two volumes, folio, 1811-14, and were engraved by William Daniell, R.A., in imitation of the original drawings. Dance held his appointment of City Surveyor till 1816, when he resigned in favour of his pupil, the late W. Montague; but he survived his retirement from practice several years, and died at his house in Gower Street, January 14th 1825, at the age of eighty-four. He was buried in St. Paul's, near Wren and Rennie.

His younger brother, **NATHANIEL DANCE**, third son of the elder George Dance, began his career as a painter, in which profession he acquired some celebrity, but his fine figure and captivating address having obtained for him the hand of the wealthy Yorkshire heiress, Mrs. Dummer, he abandoned painting, and purchased and destroyed all his former productions which he could meet with. On his marriage he had taken the name of Holland in addition to his own, and he was made a baronet in 1800. The income he acquired with his lady was about 18,000*l.* per annum, and as the Dummer estates were entailed, he contrived to amass for himself about 200,000*l.* Sir Nathaniel Dance Holland died very suddenly at Winchester, October 16th, 1811.

DANCOURT, FLORENT CARTON, a popular French dramatist and actor of the times of Louis XIV., was born in 1661, and studied at Paris under the Jesuit Larue. His preceptor, observing that his talents were far from ordinary, wished him to devote himself to the religious profession, but Dancourt preferred the law, and acquired some reputation as an advocate. He shortly however fell in love with the daughter of the comedian La Thorillière, an attachment which induced him to quit his legal studies and appear on the stage. Having married Mademoiselle La Thorillière, he became one of the king's comedians, and even one of his greatest favourites. An anecdote is told of his being saved from falling by Louis, who caught his shoulder; and in the days when this story was current, a king who under any circumstances put forth his hand towards a subject was reckoned full as condescending as one of the gods of antiquity who came down to aid some favourite hero. After remaining thirty-eight years in the service of the king, he retired to his estate at Berri, where he passed the remainder of his life in devotional exercises, and wrote some psalms and a sacred tragedy, which is not extant. He died in 1726, having superintended the erection of his own tomb, leaving two daughters, who were both actresses, and both married into families of distinction. The works of this author occupy six volumes: they were most of them successful at the time they were written. The greater number of them are farces, the scene of which lies mostly in low life. There is a drollery about them and a smartness in the dialogue which will always render them amusing, but the interest they possessed at the time of their appearance is now lost. Dancourt, being an unlearned man, sought for subjects among incidents which he himself witnessed, and which were often well known to the public. An author whose chief excellence lies in happily delineating events of a local interest may be sure of popularity, but equally sure that his popularity will be but transient. Dancourt is believed to have had many assistants in the composition of his plays.

DANDOLO, ENRICO, a patrician of Venice, who was elected doge in 1192 at a very advanced age. In the year 1201 the French crusaders applied to the Venetian senate for assistance in their expedition to Palestine. Dandolo warmly supported their petition, lent them money and provisions and ships, and stipulated in return that they should assist him in conquering the town of Zara for the republic. Dandolo, though aged and nearly blind, embarked in the admiral's ship. The crusaders took Zara, and afterwards, being invited by Alexius, son of Isaac Angelus, who had been driven from the throne of Constantinople, the Venetians and crusaders, forgetting the Holy Land, sailed for Constantinople, attacked it, and took it by storm, in 1204. Old Dandolo, then nearly ninety years of age, was the soul of this expedition; he was one of the first to land, on the first attack in 1203, and to take possession of part of the ramparts, on which he planted the standard of St. Mark. For other particulars of this expedition and its results see BALDWIN I., emperor of Constantinople. Dandolo refused the imperial crown which the crusaders had offered to him, but accepted the title of Despot of Romania. He died shortly after, in 1205, and was buried in the church of Santa Sophia. Dandolo is one of those who contributed most to the establishment of the maritime power of Venice. There have been other senators and doges of the same name.

DANIEL, one of the four great prophets (Isaiah, Jeremiah, Ezekiel, Daniel). From the first chapter of the book of this prophet we learn that he was of the tribe of Judah; that when a child he was carried captive to Babylon by Nebuchadnezzar, in the third year of the reign of Jehoiakim, king of Judah, B.C. 606; and that he was one of the "children (verse 4) in whom was no blemish, but well-favoured, and skilful in all wisdom, and cunning in knowledge, and understanding science," who were chosen by the master of the king of Babylon's eunuchs to be taught "the learning and the tongue of the Chaldeans," and to stand before the king. It appears to have been required of these children to have countenances fair and fat in flesh, and that they might acquire these qualities they were furnished with "a daily provision of the king's meat and wine;" but Daniel, otherwise Belteshazzar, and his three companions, Shadrach, Meshach, and Abednego, purposing not to defile themselves with the royal meat, obtained permission to adopt a diet of pulse and water instead, and partaking of this food they excelled in appearance all the other children who were being trained in the palace. "Daniel had understanding in all visions and dreams, and in all matters of wisdom and understanding the king found him and his three companions ten times better than all the magicians and astrologers that were in all his realm" (17, 20). In reward for the interpretation of a dream related in chapter 2, "King Nebuchadnezzar not only gave Daniel many valuable gifts, and made him ruler over the whole province of Babylon, and chief of the governors over all the wise men of Babylon, but he fell upon his face and worshipped him, and commanded an oblation and sweet odours to be offered unto him" (46, 48). Daniel's Chaldean name of Belteshazzar was that of a Babylonian deity, the god of Nebuchadnezzar; and the prophet is repeatedly said to have possessed the spirit of the holy gods, and to have been made master of the magicians, astrologers, Chaldeans, and soothsayers (iv. 8, 9; v. 11). For interpreting the mysterious writing on the wall, king Belshazzar clothed him in scarlet, put a chain of gold about his neck, and made him third ruler in the kingdom. Daniel also prospered in the reign of the Median monarch Darius (probably the Cyaxares of the Greek historians), who appointed him the first of three presidents over 120 princes, whom he set over the whole kingdom (vi. 2). Having escaped unhurt from the lions' den into which he was thrown by Darius, he continued to prosper in the reign of Cyrus the Persian (28). He did not return to Judaea on the termination of the captivity, but remained with the large portion of his countrymen who continued at Babylon, where he is generally supposed to have died. Some however state that he died at Susa, on the Euphrates. He was contemporary with Ezekiel (xiv. 14, 20; xxviii. 3). Among the Rabbis it is generally maintained that Daniel was not a true prophet; that he did not dwell in the Holy Land, out of which they say the spirit of prophecy does not reside; that he spent his life, not as the other Jewish prophets, in solitude, poverty, and abstinence, but amid the grandeur, pomp, and luxury of a royal palace; that he was a eunuch (2 Kings, xx. 18), one of a class who are excluded from the congregation of the Lord (Deut. xxiii. 1). Some place his writings among the mere Hagiographa, as having less authority than the canonical books. They account for the fact of his not being mentioned when his three companions were cast into the furnace, by saying that he was absent from Babylon on an expedition to Egypt, for the purpose of stealing hogs (Calmet's 'Dict. of the Bible'); and they object to his prophecies that they all relate to dreams and visions, which they consider the most imperfect modes of revelation. However it is said by Josephus ('Ant. Jud.,' l. x. c. 12), that Daniel was a great and true prophet, who was favoured with communications from Jehovah; he says also that Daniel built a famous palace at Susa, or Ecbatana. Dr. Adam Clarke and others think that Zoroaster was Daniel.

The twelve chapters of the canonical book of Daniel are partly in the Hebrew and partly in the Chaldaic language. The uncanonical or apocryphal books attributed to this prophet, consisting of the stories of Susannah and Bel and the Dragon, and the Song of the Three Children, are extant only in the Greek of Theodotian, which is adopted in all the Greek churches of the East, the version of the Septuagint

being lost. The following are the principal prophetic subjects of the canonical book of Daniel. Chapter 2 contains the account of Nebuchadnezzar's dream of the great image of gold, silver, brass, iron, and clay, with Daniel's interpretation. The stone which became a great mountain is considered as prophetic of the Messiah. Chapter 4 relates the same monarch's dream of the great tree, representing himself, as interpreted by Daniel, and which was speedily fulfilled. In chapter 5 is recounted Daniel's interpretation of the writing on the wall at the feast of Belshazzar. Chapter 7 contains the prophet's description and interpretation of his own dream of the four great beasts. The commentators state that the four kingdoms of the earth designed by these four beasts were the Babylonian, the Medo-Persian, the Macedo-Grecian, and the Roman. The ten horns of the fourth beast are said to be ten kingdoms, rising out of the Roman empire; but what particular kingdoms are meant appears rather difficult to determine, if we may judge from the conflicting opinions of different writers. The Rev. Hartwell Horne, in his 'Introduction to the Bible,' has tabulated the theories of some of the most eminent commentators, which exhibit scarcely a single instance of agreement in any particular. Thus, in explaining the meaning of the first horn, Machiavel applies it to the Ostrogoths, Dr. Mede to the Britons, Dra. Lloyd and Hales to the Huns, Sir Isaac Newton to the Vandals, and Bishop Newton to the senate of Rome. This dream has always been much insisted on by Protestant writers as a prophecy relating to the destinies of the Church of Rome. Daniel's vision of the ram and the he-goat described in chapter 8 is considered to signify the destruction of the Medo-Persian empire by the Macedonians, who were anciently called *Agadai*, or *Ægeates*, that is, the goat-people. The prophecy of the seventy weeks, communicated to Daniel by the angel called the man Gabriel in chapter 9, is regarded by all Christians as a striking prediction of the advent of Jesus as the Messiah. Sir Isaac Newton, in his 'Commentary on Daniel,' declares it to be the foundation of the Christian religion. The weeks are understood as being prophetic weeks, consisting each of seven years. (Leviticus, xxv. 8.) No scriptural authority is to be found for this interpretation (Le Clerc, 'Biblioth.' tom. xv. p. 201); but an instance of this mode of reckoning occurs in Macrobius, 'Somn. Scip.,' l. i. c. 6. In the 25th and 26th verses it is said that from the first year of the reign of Darius (ver. 1, 3, 28) unto the Messiah the prince would be 69 weeks, or 483 years, and that then Messiah would be cut off, which disagrees with the best chronologists, who make the first year of Darius 538 B.C. (A. Clarke's 'Bib.'). The chronological difficulties of this important prophecy have occasioned a great variety of interpretations, and exercised the pens of the most learned of the fathers and of modern divines. ('Improved Version of Daniel,' by the Rev. Thos. Wintle, 8vo. 1836; Prideaux's 'Connect.' vol. i. p. 306; Vossius, 'De 70 Hebdomad. Dan.,' p. 183.) In the 10th and 11th chapters other visions are described which relate chiefly to the conquests and revolutions of several Asiatic nations. The prophecy in the 12th and last chapter extends to the end of time, and speaks of the resurrection and the day of judgment. In the time of Jerome some few rabbis admitted the story of Susannah as canonical, while others rejected it as such; and Josephus, in speaking of Daniel, says nothing either of Susannah or of Bel and the Dragon. (Hieronymus, 'In Dan.'). A learned dissertation on these books is given by Eusebius in his 'Einleitung in die Apokryphischen Schriften,' p. 419. Porphyry, in the twelfth of his fifteen books against the Christians, impugns the genuineness and authority of the prophecies of Daniel, contending that they are falsely ascribed to him, and that they are really historical, and were written after the occurrence of the events to which they relate. Dr. N. Lardner has collected some of these objections, and accompanied them with the replies of Jerome (Lardner's 'Works,' vol. viii. pp. 185-204). Bishop Chandler, in his 'Vindication of the Defence of Christianity,' and Dr. Samuel Chandler, in a 'Vindication of the Prophecies of Daniel,' have elaborately discussed the subject of the genuineness and canonical authority of this prophetic book. It is remarked by Mr. Horne, that "Of all the old prophets Daniel is the easiest to be understood;" and that "he writes more like an historian than a prophet." Grotius, Le Clerc, and several other learned critics, have maintained that all the prophecies of Daniel relate to and terminated in the persecution of the Jews under Antiochus Epiphanes, in the age succeeding that of the prophet. In Mr. Horne's 'Introduction,' vol. ii. p. 792-3, an account is given of the principal commentators on Daniel, as Sir Isaac and Bishop Newton, Dra. Faber, Frere, Hales, &c., and of the numerous disquisitions on the particular prophecies, especially that of the seventy weeks. Numerous sermons on texts, and commentaries on the book of Daniel, are named in the 'Bibliotheca Britannica' by Watts. The book of Daniel has greatly occupied the attention of recent British writers on the prophecies; and especially in connection with the church of Rome and the Millennium.

DANIEL, LE PERE GABRIEL, a Jesuit, born at Rouen in 1649, wrote the history of France from the commencement of the monarchy, 3 vols. fol., 1713, which he dedicated to Louis XIV., who made him historiographer of the kingdom, with a pension of 2000 francs. The most valuable part of his history is that which relates to the reigns previous to Louis XI., and he is more correct with regard to facts than Mézerai. But the work altogether is very imperfect: the author says little concerning the state of society: it is a history of the kings rather than of the people. He enters very largely into religious contro-

verses, and is very intolerant towards those whom he considers heterodox. His style is feeble and uninteresting. The best edition of the history is that in 17 vols. 4to, Paris, 1755-60, with considerable additions by Father Griffet. The other works of Père Daniel are:—1, 'Observations critiques sur l'Histoire de France écrite par Mézerai,' in which he endeavours to throw discredit on the rival historian, who, although often inexact, is upon the whole more liberal-minded than Daniel, for which reason he lost his pension. [COLBERT.]. Both their histories however were superseded by the better one of Velly and Villaret, 1759; 2, 'Histoire de la Milice Française,' exhibiting the changes that had taken place in the French military establishment, and system of discipline and tactics from the beginning of the monarchy to the reign of Louis XIV.; 3, 'Le Voyage au monde de Descartes,' a kind of satire of the system of that philosopher; and several other minor works, among which the 'Entretiens de Cleandre et d'Eudoxe,' are intended as a refutation of the 'Provinciales' of Pascal. Père Daniel died in June 1728.

DANIEL, SAMUEL, was born in Somersetshire in 1562, and educated at Magdalen Hall, Oxford, which however he left without a degree, "his geny being," according to Anthony à Wood, "more prone to easier and smoother subjects than in pecking and hewing at logic." He became tutor to Lady Anne Clifford, subsequently Countess of Pembroke, and was afterwards groom of the privy chamber to Anne, queen of James I. He is said to have been poet-laureat on Spenser's death; but it is more likely that he was only one of many employed about the court in writing masques and birth-day odes, and in this capacity he seems to have stirred the wrath of Ben Jonson, who probably held him in the light of a rival. Towards the end of his life he retired into Somersetshire, where he died in 1619.

His poems consist of an Heroic, in six books, on the wars of York and Lancaster; it contains many stanzas in his best style, uniting much grace of language with sweetness of thought. Daniel partly conformed to the fashion then prevailing, which consisted in a mode of expression termed euphuism, so well known by the specimen given in 'Kenilworth;' but a perusal of his works will show that, of the numerous Latinised words which the revival of learning introduced into our tongue, his good taste prompted him to choose, with very few exceptions, those which are at present in use; that is, he only admitted those which were really necessary to complete the language. The poem next in length is 'Musophilus,' a dialogue between Musophilus and Philocosmus. It is, we think, his masterpiece both in thought and execution; the somewhat irregular terza-rima in which it is written seems well adapted for a union of sweetness and continuity of thought. The other poems contained in the edition of 1602 are, 'A Letter from Octavia to Mark Antony, which shows to a striking extent that faculty peculiar to a true poet, which has been called "dramatic power," but which would perhaps be better understood by the words "power of identification," by which the poet speaks naturally in any character; 'The Tragedy of Cleopatra,' in alternate rhymes, with chorusses on the antique model; and 'The Complaint of Rosamond,' who speaks from the infernal regions, but is little encumbered by classical imagery after the first few sentences. 'The Complaint' is written in a seven-line stanza, of which the first and third, the second, fourth, and fifth, and the two last, rhyme; and contains much beautiful description as well as tender thought, introducing sensuous imagery without the least approach to indelicacy or impurity; indeed the whole character of his poems quite justifies the somewhat quaint assertion of old Fuller that "he carried in his Christian and surname two holy prophets, his monitors, so to qualify his raptures that he abhorred all profaneness." Besides these poems, are fifty-seven sonnets to Delia, several masques, odes, and epistles. His prose works are, 'A History of England, in two parts, extending to the reign of Edward III., and 'An Apology for Ithyme,' which last shows a close acquaintance with the rules and niceties of his art, and contains several remarks on rhythm, interesting in illustration of the change in pronunciation which had taken place since Chaucer. On the whole, whether as a poet or a prose writer, Daniel has been most undeservedly neglected.

DANIELL, WILLIAM DANIELL, R.A., painter and engraver, was born in 1769, and at the age of fourteen accompanied his uncle, Thomas Daniell, to India. They commenced their journey at Cape Comorin, and explored and sketched almost everything that was beautiful or interesting in the country between that point and Serinagar in the Himalaya Mountains: this arduous undertaking employed them ten years. They took an amazing number of sketches, many of which they afterwards engraved and published in a large form, comprised in one great work entitled 'Oriental Scenery,' in 6 vols. folio, completed in 1808. Five of these six volumes were engraved by or under the direction of William; the remaining volume, containing the 'Caves of Ellora,' was executed by Thomas from drawings by James Wales. Besides the above work, William Daniell engraved and published, between 1801 and 1814, the following works:—'A Picturesque Voyage to India;' 'Zoography,' in conjunction with Mr. W. Wood; 'Animated Nature,' 2 vols.; a series of views entitled 'The Docks;' and 'The Hunchback,' after R. Smirke, R.A. Between 1814 and 1825 he was chiefly engaged in a work of extraordinary labour, entitled 'Voyage round Great Britain.' In this arduous undertaking he spent the summer of every year, collecting drawings and

making notes. The difficulties he met with in prosecuting this plan were extreme, and had it not been for the cheering influence of the hospitable reception which he occasionally experienced from persons to whom he had letters of introduction, the accomplishment of his task would have been impossible: "immense fatigue, exposure to weather of all kinds, wretched fare, and still more wretched accommodation, were his constant attendants."

Besides these works, Daniell painted many large and interesting oil-pictures of remarkable places or scenes in India. In 1832 he painted, in conjunction with Mr. Paris, a panorama of Madras; and, more recently, two others by himself—'The City of Lucknow,' and 'The Elephant-Hunt;' and he was the chief contributor to the 'Oriental Annual.' His style of colouring was rather hard and red, which arose perhaps from the climate of India and the peculiar nature of its scenery. He died in 1837.

THOMAS DANIELL was likewise a member of the Royal Academy, and a very able landscape-painter and engraver; he was originally a heraldry painter. He published some works on India besides that already mentioned. He was a fellow of the Royal, of the Asiatic, and of the Antiquarian societies. He died in 1840, aged ninety-one. Another member of this family, SAMUEL DANIELL, also distinguished himself by some similar works. He spent three years at the Cape of Good Hope, and published, in 1808, some prints descriptive of the scenery, habitations, costume, and character of the natives, and an account of the animals of Southern Africa. He published also, in 1808, illustrations of the scenery, animals, and native inhabitants of the island of Ceylon.

DANIELL, JOHN FREDERICK, was born in Essex-street, Strand, on the 12th of March 1790, and was the son of Mr. George Daniell, of West Humble, Surrey, benchor of the Middle Temple. At an early age he became a pupil of Professor Brande, in whose society he made several tours. Mr. Daniell entered originally into business as a sugar-refiner, but his fondness for scientific investigations, manifested at a very early age, prevailed, and he soon relinquished business for pursuits more congenial to his taste. In 1814 he became a Fellow of the Royal Society. In 1816, associated with Professor Brande, he commenced the 'Quarterly Journal of Science and Art,' the first twenty volumes of which were published under their joint superintendence. He married in the following year Charlotte, youngest daughter of the late Sir W. Rule, surveyor of the navy. From this time to his death hardly a single year elapsed without the appearance of one or more essays on chemical or meteorological subjects from the pen of Mr. Daniell. In 1820 he published the account of his new hydrometer, an instrument which, for the first time, rendered regular and accurate observations on the dryness and moisture of the air practicable. In this instrument he applied the principle of the cryophorus of Wollaston to obtain the requisite cold for the production of dew upon a ball of dark-coloured glass containing ether. The temperature of the inclosed ether is measured by a delicate thermometer without the bulb, and corresponds with the dew-point. This instrument has been extensively employed in all climates, and has been of the greatest service to meteorology. In 1823 appeared his great work, 'Meteorological Essays;' a second edition was published in 1827, and he was engaged in revising proofs of the third edition at the time of his death. This was the first synthetic attempt to explain the general principles of meteorology by the known laws which regulate the temperature and constitution of gases and vapours, and in which the scattered observations and isolated phenomena presented by the earth's atmosphere were considered in their most extensive and general bearings. One of the most interesting of his theories connected with meteorology was that which he proposed to account for the horary oscillations or periodic daily rise and fall of the barometer, by which he predicted the occurrence of a fall near the poles coincident with the rise at the equator. Actual observations soon confirmed the accuracy of his theory, and the existence of this unsuspected phenomenon was established beyond dispute. In the year 1824 he published an 'Essay on Artificial Climate,' for which he received the silver medal of the Horticultural Society. Dr. Lindley has expressed a strong opinion on the practical value of this paper in completely revolutionising the methods of horticulture till then adopted.

About this period Mr. Daniell became managing director to the Continental Gas Company, and travelled through most of the principal European cities with Sir W. Congreve and Colonel Landmann, making the arrangements by which many of them are lighted at the present day. He also invented a new process for obtaining inflammable gas from resin, which was successfully applied to the lighting of some of the large towns in America.

On the establishment of King's College in 1831, Mr. Daniell was appointed professor of chemistry, the duties of which office he discharged till his death. About this time he published the account of his new pyrometer, an instrument far superior to any that had been invented, for measuring high temperatures, such as those for fusing metals, furnaces, &c. For this simple and perfect invention, the Royal Society, in 1832, awarded him the Rumford medal. From this time his attention seems to have been principally devoted to voltaic electricity. In 1836 he communicated to the Royal Society a paper in which he described his valuable improvement in the voltaic battery. In this communication he traced the cause of the rapid decline of

power in batteries of the ordinary description, and pointed out an arrangement by which a powerful and continuous current of voltaic electricity may be maintained for an unlimited period. The importance of this discovery was recognised immediately by the whole scientific world, and in appreciation of its merit, the Royal Society, in 1837, awarded him the Copley medal. In 1839 he published his 'Introduction to Chemical Philosophy,' an admirable treatise on the action of molecular forces in general, though it modestly professes to give little more than a simple introduction to the discoveries of Faraday, and their applications to chemistry. He continued his researches in the same department of science till the time of his decease, communicating the results of his experiments to the Royal Society. For two of these papers, bearing most essentially on the theory of salts, he received, in 1842, one of the Royal medals.

In 1843 the University of Oxford conferred upon him the honorary degree of D.C.L., and in the same year he published the second edition of his 'Introduction to Chemical Philosophy.' For more than thirty years he was a zealous and active member of the Royal Society, and for the last six years he held the honourable office of foreign secretary to that learned body. Besides his professorship in King's College, he held the post of lecturer to the East India Company's military seminary at Addiscombe, and was examiner in chemistry to the University of London since the opening of that institution.

On the 13th of March 1845 Mr. Daniell, while attending a meeting of the council of the Royal Society, and having just spoken on a point under consideration, apparently in perfect health, was seized with an apoplectic fit. In five minutes from the commencement of the attack he was dead. A subscription was formed at King's College for the purpose of having a bust executed, and for the establishment, in connection with the college, of a Daniell Scholarship in the science of which he was so distinguished an ornament.

It is worthy of remark, as illustrating the extent and diversity of his attainments, and the importance of his discoveries, that he is the only individual on whom all the three medals in the gift of the Royal Society were ever bestowed. The following is a list of his most important essays, with their dates:—1816, 'On some Phenomena attending the process of solution,' in 'Quarterly Journal of Science,' vol. i. 1817, 'On the mechanical structure of iron, developed by solution, and on the combination of silex in cast-iron,' ditto, vol. ii. 1818, 'Observations on the theory of spherical atoms, and the relation which it bears to the forms of certain minerals,' ditto, vol. iv. 1818, 'On the strata of a remarkable chalk found in the vicinity of Brighton and Nottingham,' ditto, vol. iv. 1819, 'On the Formation and Decomposition of Sugar, and the Artificial Production of Crystallised Carbonate of Lime,' ditto, vol. iv. 1819, 'On the Acid formed in the slow Combustion of Ether,' ditto, vol. vi. 1820, 'On a new Hygrometer,' ditto, vol. viii. 1821, 'Description of a new Pyrometer,' ditto, vol. xi. 1821, 'Experiments to ascertain the effects of the great Eclipse in September, 1820.' 'On the Gaseous and Aqueous Atmospheres,' ditto, vol. x. 1822, 'Inquiry, with Experiments, into the Nature of the Products of the slow Combustion of Ether,' ditto, vol. xii. 1822, 'Comparative Remarks (with three tables) on the Weather, and Seasons of the years 1819, 1820, and 1821,' ditto, vol. xii. 1822, 'On the Correction to be applied in Barometrical Measurement for the Effects of Atmospheric Vapours by means of the Hygrometer,' ditto, vol. xiii. 1823, 'Meteorological Essays,' first edition, the second edition was published in 1827. 1824, 'Essay on Climate considered with regard to Horticulture,' in 'Horticultural Transactions,' 1824. 1825, 'Observations and Experiments of Evaporation,' in 'Q. J. of Science,' xvii. 1825, 'On the Horary Oscillation of the Barometer,' ib. xvii. 1825, 'Observations on the Radiation of Heat in the Atmosphere,' ib. xvii. 1826, Two papers 'On the Barometer,' followed by Correspondences, 'Q. J. of Sc.' vols. xix. and xxi. 1830, 'On certain Phenomena resulting from the Action of Mercury on different Metals,' in 'Royal Institution Journal,' vol. i. 1830, 'On a New Register Pyrometer for measuring the Expansion of Solids, and for determining the higher degrees of Temperature upon the Common Thermometric Scale,' 'Phil. Trans.,' 1830. 1831, 'On the Relation between the Polyhedral and Spheroidal Theories of Crystallization, and the Connection of the latter with the Experiments of Professor Mitscherlich,' in 'Royal Institution Journal,' vol. ii. 1831, 'Further Experiments on a New Register Pyrometer for measuring the Expansion of Solids,' in 'Phil. Trans.' 1831. 1832, 'On the Water Barometer erected in the Hall of the Royal Society,' in 'Phil. Trans.,' 1832. Several papers 'On Voltaic Combinations (the Constant Battery),' in 'Phil. Trans.,' 1830, 1839, and 1842. 1839, 'Introduction to Chemical Philosophy,' 2nd ed., 1844. Three letters 'On the Electrolysis of Secondary Compounds,' 1839, 1840, and 1844. 1841, 'On the Spontaneous Evolution of Sulphuretted Hydrogen in the Waters of the Western Coast of Africa, and of other Localities,' in 'Phil. Mag.,' vol. xix.

DANNECKER, JOHANN HEINRICH, was born at Stuttgart, Oct. 16, 1768. His father was a groom employed in the stables of the Duke Karl of Wurtemberg, at Stuttgart, where his particular business was with the mules; and young Dannecker was brought up in a very humble manner. In 1794 his father was removed to Ludwigsburg, and here Dannecker, though then only six years of age, evinced signs of that talent for art for which he was afterwards so eminently distinguished. His first essays were flowers and soldiers, which he drew

on any scrap of paper that came into his hands, or he scratched them upon stones. In 1771, in his fourteenth year, Dannecker entered, by the duke's desire, but against his father's wish, the school established at Ludwigsburg for the education of the children of the court-servants. He was first placed in the dancing-school, in which he met with four fellow-pupils who became the most celebrated of his countrymen in their respective lines—the sculptor Scheffauer, the engraver J. G. Müller, the musician Zumsteeg, and the poet Schiller. He made such progress in drawing in two years as to be removed from the dancing-school and placed in the school of plastic design, under direction of the sculptors Bauer and Le Jeune, the modeller Sonnenstein, and the painters Harper and Guibal. In this school he remained three years, when, in 1790, in his eighteenth year, he obtained the prize for the best model of Milo of Croton destroyed by the lion; upon which he was appointed sculptor to the duke, with a salary of 300 florins per annum. In 1793 he went with Scheffauer on foot to Paris, and there studied under Pajou; after a two years' stay in Paris, the two friends departed together, again on foot, for Rome, where Dannecker remained until 1799, and contracted a friendship there with Herder, Göthe, and Canova. A 'Ceres and Bacchus' which he executed in Rome were Dannecker's first works in marble: they are now in the palace at Stuttgart.

After 1790 Dannecker lived, with the exception of a few short intervals, wholly at Stuttgart; three of these intervals were occasioned—by a visit to Paris, to view the works of art collected together by Napoleon; by a visit to Zürich to model the bust of Lavater; and by another to Vienna, in the time of the congress in 1815, to model the bust of Metternich. He was professor of sculpture, and director of the School of Art, at Stuttgart; and inspector of the Royal Gallery of Ludwigsburg. He was offered in 1808 the professorship of sculpture in the Academy of Munich, which he declined. He died on the 8th of December 1841.

Dannecker's works are chiefly executed in the round; there are few bas-reliefs by him, but those few are excellent: a predilection also for representing the female figure is a characteristic of his taste. He was likewise excellent in portraiture; he had a strong perception of individuality of character, and great facility in expressing it. His works however, during the course of his long career, evince the providence of a various taste in design in three different periods. At first his works were not marked by any particular originality of thought or excellence of design, but were conceived and executed in the spirit of such works as he had access to in Wurtemberg or at Paris, and were in the taste of the French school. In Rome other styles were revealed to him, both in the works of Canova and in the antique, and his own works in a few years were characterised by a strong expression of the ideal, especially in the female form. The following works are eminently distinguished in this respect:—'Mourning Friendship,' executed in 1804 for the monument raised by Frederic, king of Wurtemberg, to his minister, Count Zeppelin, at Ludwigsburg; the 'Ariadne reclining on a Leopard,' in the garden of M. Bethmann at Frankfurt; and 'Cupid and Psyche' in the royal villa of Rosenstein near Stuttgart. His later works were more ideal in character than in form, and his object was to personify religious resignation. Of these his figures of Christ, John the Baptist, and Faith, are the most celebrated. His male figures however are effeminate, and in his Christ, meekness, more peculiarly a female quality, is the predominant sentiment.

Dannecker's greatest excellence was in his busts; he has left many interesting monuments in this branch of art, and foremost among them are the small and colossal busts of Schiller; the busts of Lavater, Gluck, the kings Frederic and William of Wurtemberg, and other members of the royal family, and the medallions of Haug and Jung Stilling.

Dannecker ranks as one of the best of the modern sculptors, and his great merit seems to consist in a proper perception and representation of the finer and more gentle qualities of the soul, and of the more delicate characteristics of the human frame. His forms are true to nature, but uniform in character; and the sphere of his art is very circumscribed. Dannecker never attempted, or at least never accomplished, the representation of manly vigour or robust masculine beauty; in the female figure however he was natural, graceful, and unaffected; but in his draperies he was frequently untrue. Instead of the natural and elegant folds which loose draperies assume on the human figure, he gave way to the conventional affectation of showing the exact form of the body beneath the draperies, as if they were wet, and adhered to it; producing an effect by no means beautiful, and, except when blown by the wind, unnatural; and in this case the parts not attached to the body must show a corresponding action.

An account of the life and works of Dannecker was published at Hamburg in 1841, with 25 lithographic prints of his principal works, from drawings by his pupil Wagner, likewise a celebrated sculptor. There is also a notice of Dannecker in the first and second numbers of the *Kunstblatt* for 1842.

DANTAN, JEAN PIERRE, a French sculptor, who has acquired a somewhat peculiar kind of celebrity. He was born at Paris, December 28, 1800; and received his professional training, first, in the studio of his father, Antoine Laurent Dantan, a sculptor of high standing, who is still living, and subsequently under Bosio. The young Dantan first became known by his busts and portrait statues, which were admired

for their fidelity, and thought to promise for the artist a high position as a portrait sculptor. But giving way to a strong inclination to caricature, he about 1381 caught the fancy of the Parisian public by issuing in quick succession a series of grotesque statuettes of the leading celebrities of the capital. These 'charges,' as they were called, were in fact something quite new in the world of art; and they were as clever as they were novel. Dantan seized the leading features of the face and exaggerated and distorted them with singular ingenuity, yet always so as to refrain from rendering the person caricatured in any way ridiculous, whilst the likeness and every peculiarity of expression seemed brought out with a greatly increased force by this good-humoured heightening. But Dantan, instead of confining his caricature to the face like ordinary caricaturists, placed the head on a diminutive body, which seemed at first glance mainly to serve as a pedestal, but in which, and especially in the hands, the characteristic expression was continued and strengthened with the most amusing absurdity. No wonder that works of this kind, executed with the mastery of a finished artist, and bringing out with ludicrous vehemence the well-remembered expression and habit of each 'lion of the hour,' should become excessively popular with a race who, whilst almost worshipping the ruling favourite, of all things enjoys best a laugh at his expense. Soon came from Dantan's 'charges' of Victor Hugo, Dumas, and many other well-known writers, of Horace Vernet and other artists, of Talleyrand and other statesmen, and especially of Paganini, Berton, Musard, Lablache, Tamburini, Rubini, Thalberg, and many more musicians and singers, and of Bouffé, Frederick Lemaître, and other actors in their most popular characters, were in every window, and some one or other in almost every house; and it may be doubted whether many of these men do not still, when they recur to the memory of the majority of Frenchmen, assume the shape of their Dantesque 'charges.' Having thus secured the features of the world of Paris M. Dantan determined to do the same kind of office for that of London; and a ludicrous series of British heads—including Wellington and Brougham, O'Connell and Cobbett, Rogers and Rothschild—were the result of his visit to this country: but happily as he caught and enlarged 'with thrice-piled hyperbole' some of the more strongly-marked physiognomies, he hardly found himself thoroughly at home with our countrymen. M. Dantan has during the last few years executed several marble busts of various eminent persons, free from all tendency to caricature, but admirable as likenesses.

DANTE or DURANTE, ALIGHIERI, was born at Florence on the 8th of May 1265. By a familiar contraction of his Christian name, Durante, he was called Dante, by which name he has become generally known. His family was noble; he was a great grandson of Cacciaguida Elisei, who married a lady of the family of Alighieri of Ferrara, and whose children assumed the arms and the name of their mother. Cacciaguida accompanied the Emperor Conrad III. in his crusade, was made a knight, and died in battle in Syria in 1147; ('Paradiso,' cantos 15, 16, and 17, in which Cacciaguida is made to relate to Dante his adventures, with an interesting account of the state of Florence and the primitive manners of its citizens in his time, before the breaking out of the great feud between the Guelphs and the Ghibelines). Dante's father, Aldighiero Alighieri, died while Dante was yet a child. As Dante grew up he showed great capabilities for learning, in which he was assisted by Brunetto Latini, a celebrated scholar of the time. He became also intimate with Guido Cavalcanti, a young man of an inquisitive and philosophical turn of mind. It is asserted by some that Dante studied at Bologna, though this is not clearly ascertained; it is however evident from his works that he had deeply read and was imbued with all the learning of that age. By his own account he seems to have led rather a licentious life until he fell in love with Beatrice Portinari, of an illustrious family of Florence. His attachment however appears to have been purely platonic, but it served to purify his sentiments; the lady herself died about 1290, when Dante was 25 years of age, but he continued to cherish her memory, if we are to judge from his poems, to the latest period of his life. It must have been about or a little before the time of Beatrice's death that he wrote his 'Vita Nuova,' which is a series of canzoni intermixed with prose, in which he speaks of his love in a spiritual and platonic strain, and of the change it produced in him, which was the beginning of his "new life."

The party of the Guelphs was at that time predominant at Florence, having some years before driven away the Ghibelines with the assistance of the pope and of Charles of Anjou, king of Naples. But in the neighbouring city of Arezzo the contrary had occurred; the Ghibelines, with the bishop at their head, being the stronger party, had turned the Guelphs out of the town. The Guelphs of Arezzo applied to those of Florence for assistance. This led to a war between Florence and Arezzo, in which the Ghibelines of the latter place were defeated at Campaldino in June 1289, when their bishop was killed. Dante was present at this engagement, and soon after his return to Florence he married Gemma Donati, of a powerful Guelph family. He now became a candidate for civic honours and offices. The citizens of Florence were classed into three ranks:—1st, grandi, or old families, formerly feudal nobles, many of whom had still feudal estates in various parts of the country, though in the town they enjoyed by law no exclusive privilege; 2nd, popolani grassi, or substantial citizens, men who had risen by trade, and many of whom were wealthier than

the nobles; 3rd, piccoli, or inferior tradespeople, artisans, &c. The two last classes, weary of disturbances created by faction, and being directed by some well-meaning men, among whom was Dino Compagni the chronicler, who is the safest guide through this part of Florentine history, had made a law in 1282 by which the citizens being classed according to their trades, the higher trades, "arti maggiori," chose six priori, or aldermen, one for each district of the city, who were called also "i signori" and constituted the executive. They were renewed every two months. No one could aspire to office who had not his name inscribed on the register of one of the trades. Dante enrolled his name on the register of physicians and apothecaries, though he never exercised that profession.

The institution of the priori did not prevent the town being distracted by factions as before, as those magistrates often availed themselves of their brief term of office to favour their friends and court favour with the wealthier citizens. To remedy this, the popular party, led by Giano della Bella, in 1293 elected a new officer, called Gonfaloniere di Giustizia, who was to enforce order and justice, and gave him a guard of 1000 soldiers: they also excluded for ever thirty-three families of the grandi, or nobles, from political office. But a conspiracy of the wealthy families drove away Giano della Bella and his adherents in 1294, and the town again fell a prey to factions. Two powerful families, the Donati and the Cerchi, were at the head of the contending parties, and affrays between their respective partisans occurred repeatedly in the streets of Florence. Both were Guelphs, but the Cerchi were suspected of a bias in favour of the Ghibelines, because they were less rigorous in enforcing the penal laws against the latter; and they had also for them the friends of the unjustly-expelled Giano della Bella. The pope, Boniface VIII., favoured the Donati as being zealous Guelphs. About this time the town of Pistoia was likewise divided between two factions, called Bianchi and Neri, which originated with two branches of the family of Cancellieri. The Florentines being applied to as arbitrators, several of the more violent partisans were exiled from Pistoia, and came to Florence, where the Bianchi became connected with the Cerchi and the Neri with the Donati, and from these connections the two Florentine parties assumed the respective names of Bianchi and Neri. Both, as we have said above, were branches of the great Guelph party then predominant at Florence; but afterwards the Bianchi in their reverses joined the Ghibelines, with whom they have been often confounded by subsequent writers. It is necessary to bear these things in mind, in order to understand the history and the political sentiments of Dante. Dante was a Guelph, and connected by marriage with the Donati, the leaders of the Neri. But he was also connected by personal friendship, and perhaps also by a feeling of equity, with the Bianchi, who appear to have shown themselves from the first less overbearing and violent than their antagonists, and to have been in fact the injured party. Dante being made one of the priori in June of the year 1300, proposed and carried a law by which the chiefs of both parties were exiled for a time out of the territory of the republic. The Bianchi were sent to Sarzana, and the Neri to Castel della Pieve. Some of the Bianchi however soon after returned to Florence, and Dante was accused of having connived at it, chiefly out of friendship for Guido Cavalcanti, who had suffered from the unwholesome climate of Sarzana, and died soon after his return. The Neri, by their agents at Rome, represented to Boniface VIII. that the Bianchi kept up a communication with the Ghibelines of Arezzo, Pisa, and other places, and that if they obtained the preponderance in Florence, they would make common cause with the Colonna, the pope's personal enemies. [BONIFACE VIII.] Through these suggestions, aided by bribes distributed by the Neri at the Roman court, as Dino says, Boniface was induced to give his support to the Neri, and he sent them Charles de Valois, brother of Philippe le Bel, under the plausible title of peace-maker. Charles entered Florence in November 1301, followed by 1200 armed men. Affecting impartiality at first, he let all the Neri return to Florence, followed by the armed peasantry; new priori were made, all favourable to the Neri, and the Bianchi began to be openly attacked in the streets. The Medici, who were already an influential family among the people, killed one of the Bianchi, and no notice was taken of the murder. A general proscription of the Bianchi now began, connived at by the peace-maker, Charles de Valois. "People were murdered in the streets; others were dragged into the houses of their enemies, where they were put to the torture in order to extort money from them, their houses were plundered and burnt, their daughters were carried away by force; and when some large house was seen in flames, Charles used to ask, 'What fire is that?'" and those around him answered him that it was some wretched hovel, whilst in reality it was a rich palace." (Dino, 'Chronica,' lib. ii.) The house of Dante was one of those that were plundered. Dante was at the time at Rome, whither he had been sent by the Bianchi to counteract, if possible, the suggestions of their antagonists. On hearing the news of the proscription he hastily left Rome, and joined his fugitive friends at Arezzo. In January 1302, a sentence was passed condemning him to two years' exile and a fine of 8000 florins, and in case of non-payment his property to be sequestered. By a second sentence, dated March of the same year, he and others were condemned, as barattieri, or guilty of malversation, speculation, and usury, to be burnt alive. The sentence was grounded merely on the public

report of his guilt, "fama publica," which in this case meant the report of his enemies. This curious document was found in the archives of Florence in the last century, and has been transcribed by Tiraboschi, 'Storia della Letteratura,' tom. v., part 2, cap. 2. Dante now began his wanderings, renouncing his Guelph connections, and intent upon exciting the Ghibelines of Italy against his enemies and the oppressors of his country. He appears to have repaired first to Verona, which was then ruled by the family of La Scala, powerful leaders among the Ghibelines. But he soon after returned to Tuscany, where the Bianchi and Ghibelines now united were gathering their strength in the neighbourhood of Arezzo.

The death of Boniface VIII. in September 1303 inspired them with fresh hopes. Benedict XI., the new pope, a man of a mild and conciliatory spirit, sent Cardinal de Prato to endeavour to restore peace in Tuscany, but the cardinal was opposed by the ruling faction at Florence, who frightened him out of the town. Florence was left a prey to anarchy, during which a fire broke out which destroyed 1900 houses in June 1304. The Bianchi and Ghibelines thought of availing themselves of the confusion to surprise the town; and some of them actually entered one of the gates, but they were badly supported by those outside, and the attempt totally failed. Dante ('Purgatorio,' xvii.) censures the want of prudence and concord in the leaders on that occasion. He seems soon after to have left them in disgust, determined to regulate himself in future according to his own judgment. He says himself that "it was difficult to say which of the two contending parties was most in the wrong." ('Paradiso,' vi. 102.) Dante appears to have been at Padua about 1306, and in the following year with the Malaspina, the lords of Lunigiana; he was also at times in the valleys of Casentino, and in the mountains near Arezzo; some say he went afterwards to Paris, and remained there some years; others believe that he did not go to France until after the death of Henry VII. in 1313. But his visit to Paris is very doubtful; though in canto x. of the 'Paradiso,' he speaks of a certain Sigieri, professor of that university, and designates the street in which he lived.

Dante made also an attempt to obtain the revocation of his own sentence by writing to his countrymen a pathetic letter beginning with the words—"Popule mee, quid feci tibi?" but all to no purpose. The family of Adimari, who had taken possession of his property, opposed his return. Accordingly, in canto xvi. of the 'Paradiso,' he has launched a violent invective against them.

The election of Henry of Luxemburg, or Henry VII., to the crown of Germany, revived the hopes of Dante, as Henry was preparing to come to Italy in order to assert the long-neglected rights of his predecessors as kings of the Romans. The Ghibeline leaders were ready to support his claims as imperial vicars, and the Ghibeline cities, such as Pisa, were likewise in his favour. In order to strengthen their zeal, Dante, about 1310, addressed a circular letter "to the kings, dukes, marquises, counts, the senators of Rome, and all the people of Italy, congratulating them on the prospect of happiness for Italy through the ministry of the pious Henry, who will punish the felons who opposed him and bestow mercy on the repentant," &c. It was about this time that he wrote his book 'de Monarchia,' which may be considered as a profession of Ghibeline political faith: it asserts the rights of the emperors, as successors of the Cæsars, to the supreme temporal power, entirely independent of the popes, who are the spiritual heads of the church. This creed was in opposition to the assumed rights of Gregory VII., Innocent III., and other pontiffs, who pretended to be above all crowned heads, and to have the disposal of thrones and principalities, an assumption which the Guelphs favoured in Italy in order to keep themselves free of the imperial authority. Both parties in fact acknowledged an external superior, although both wished to rule in their respective communities with as little subserviency as possible to the nominal supremacy of either pope or emperor. But there was this difference, that the imperial, or Ghibeline party, was mostly supported by the nobles, especially of North Italy, who styled themselves vicars of the emperor, and was therefore more aristocratic in its spirit, while the Guelphs of Tuscany looked upon the pope chiefly as an auxiliary in time of need, whose temporal interference was less direct, and could be more easily evaded than that of the emperor, so as to admit of a more popular or democratic spirit in their institutions. Such at least was the theory of the two parties, for in reality the Guelph or popular families formed an aristocracy of wealth as much as the Ghibelines were an aristocracy of birth and rank. Dante, in his book, 'de Monarchia,' is no servile advocate for despotism, for he maintains that sovereigns are made to promote the good of their subjects, and not subjects to serve the ambitious pleasure of their sovereigns. The latter are to rule so as to soothe the wayward passions of men, in order that all may live in peace and brotherly feeling. But still he derives their authority from God, and he quotes in support of his system, Aristotle, the Scriptures, and the Roman History, agreeably to the scholastic logic of his times. This book 'de Monarchia' was burnt at Bologna by order of the papal legate after Dante's death.

Henry VII. came to Italy in 1310, was crowned at Milan as king of Lombardy, and the following year he besieged Cremona, Brescia, and other places. It was about this time that Dante, impatient to see the emperor come into Tuscany to put down the Guelphs, addressed to him an epistle which begins thus:—"Sanctissimo triumphatori et

domino singulari, domino Henrico, divina Providentia Romanorum regi, semper Augusto, devotissimi sui Dantes Aligherius Florentinus et exul inmeritis, ac universaliter omnes Tusci qui pacem desiderant terræ, oculantur pedes." He then entreats the emperor not to tarry any longer on the banks of the Po, but to advance south of the Apennines and put down the spirit of Guelph sedition at Florence, against which he inveighs in no moderate terms, and which, he says, strives to predispose against him the mind of the sovereign pontiff. He speaks of Florence as revolting unnaturally against her parent Rome, for Dante always affects to consider Rome as still the seat of the empire, and Rome and the empire are often employed by him as synonyms. This remarkable epistle, of which we had only an Italian version until the Latin text was discovered some thirty years since in the library of St. Mark, is dated from Tuscia, near the founts of Arno, April, 1311. ('Dantis Alighierii, Epistolæ quæ extant, cum notis Caroli Witte,' Padua, 1827.) Henry came into Tuscany, threatened Florence, but without effect, was crowned at Rome, and on his return died suddenly at Buonconvento, near Siena, in August, 1313. This was a terrible blow to the hopes of the Ghibelines, and of Dante especially. He now took refuge at Verona, at the court of Cane della Scala, where he appears to have been before, between 1308 and 1310. Cane was hospitable and generous to the Ghibeline emigrants, but Dante, with his proud spirit and temper soured by adversity, could ill accommodate himself to the flattery of courts and the flippancy of courtiers, and he is said to have had some unpleasant bickerings with the people about Cane.

In a well-known passage of his poem he feelingly deplores the lot of the exile who is constrained to eat the bitter bread of patronage:—

"Tu proverai sì come s'è di sale,
Lo pane altrui, e com'è duro calle,
Lo scendere, e 'l salir per l'altrui scale."
"Paradiso," canto xvii.

"Thou shalt prove
How salt the savour is of other's bread;
How hard the passage, to descend and climb
By others' stairs."—CARY.

With Cane himself however he seems to have continued on good terms; he speaks very highly of his hospitality in a passage just preceding the above lines, and there is a cordial letter from him to Cane, written probably in the latter years of his life, in which he dedicates to him his 'Paradiso,' the latter part of his great poem, and explains the object of it. He says that he styled it a comedy, because, contrary to the style of tragedy, it begins with sorrow and ends with joy; he distinguishes between the literal and the allegorical sense of his verses, and observes that his poem may be called polymersum, having many meanings. He tells Cane the title of his work:—"Incipit Comedia Dantis Aligherii, Florentini natione non moribus." But the title of the part which he sends to him with the letter is:—"Incipit Cantica tertia Comediæ Dantis quæ dicitur Paradisus." It is evident from this and other circumstances, that Cane had not seen the rest of the poem; indeed it is not likely that Dante ever communicated the whole of it to any one during his lifetime, as it would have made it impossible for him to have found refuge anywhere, as Foscolo closely argues in his very elaborate and very critical 'Discorso sul testo di Dante,' which is one of the most judicious and scholar-like commentaries on that poem.

Of Dante's 'Commedia' we cannot enter here into any details, and we must refer the reader to the numerous commentaries, illustrations, and translations of it in every language of Europe. It is one of the few works of imagination which have stood the test of ages, and which will pass down to the remotest generations. It resembles no other poem; it is not an epic; it consists of descriptions, dialogues, and didactic precepts. It is a vision of the realms of eternal punishment, of expiation, and of bliss, in the invisible world beyond death. Its beauties are scattered about with a lavish hand, in the form of episodes, similitudes, vivid descriptions, and above all, sketches of the deep workings of the human heart. It is especially in this last department of poetical painting that Dante excels. Whether he describes the harrowed feelings of the wretched father in Ugolino, or the self-devotedness of the lover in Francesca, or the melting influence of the sound of the evening bell on the mariner and the pilgrim; whether he paints the despair of the reprobate souls gathered together on the banks of Acheron, cursing God and the authors of their being, or the milder sorrow of the repentant, chanting the 'miserere' along their wearisome way through the regions of purgatory,—he displays his mastery over the human feelings, and his knowledge of those chords that vibrate deepest in the heart of man. No other writer except Shakspeare can be compared to Dante in this respect. His touches are few, but they all tell. His power of invective is grand and terrific; witness his imprecations against Pisa, against Florence, against his enemies, his address to the German, Albert, representing to him the anarchy of Italy, and his repeated denunciations of the vices of the court of Rome. Yet Dante was a sincere Roman Catholic; in his poem he places the heretics in hell, and Dominic in Paradise; and manifestly shows everywhere his belief in the dogmas of the Roman church, but he attacks its discipline, or rather the relaxation of its discipline. He urges, like Petrarch and other

Catholic writers of that and the following ages, the necessity of a reform; and, above all, of a total separation of the spiritual from the temporal authority, things generally confounded by the Roman canonists. That many parts of his poem are allegorical is evident, but that the whole poem is an allegory, a political mystification, as some have pretended, seems a far-fetched hypothesis, an ingenious paradox. Dante was a declared enemy to the Guelphs of Florence and their allies, the papal court and the king of France; and he poetically represents these three at the beginning of his poem by the emblems of the panther, the wolf, and the lion; but soon after he drops all metaphor, and inveighs against all three in the plainest and the bitterest terms, which he would not have done had he meant to be understood only by the adepts of a secret sect. In canto xix. of the 'Paradiso' he passes in review all the kings of his time, and spares none of them in his reproof; in another place he has something to say against almost every one of the Italian cities and populations. In fact Dante never published his whole poem in his lifetime, for he had spoken in it too plainly to be able to publish it in safety. He wrote it out of the fullness of his heart, in detached parts, and at different periods, and his strains were influenced by the various political vicissitudes of the times, and by his own alternate hopes and despondency. About the year 1816 he had still a chance of his recall to Florence. It was suggested to him by a friend whom Dante in his reply calls father, probably because he was a clergyman, that he might return, provided he acknowledged his guilt and asked absolution. His answer was characteristic of his mind: "No, father, this is not the way that shall lead me back to my country. But I shall return with hasty steps if you or any other can open me a way that shall not derogate from the fame and honour of Dante; but if by no such way Florence can be entered, then to Florence I shall never return. Shall I not everywhere enjoy the sight of the sun and stars? May I not seek and contemplate truth anywhere under heaven without rendering myself inglorious, nay infamous, to the people and commonwealth of Florence? Bread, I hope, will not fail me." (See text and translation of this letter in Foscolo's 'Essays on Petrarch and Dante,' 8vo., 1823, with a sketch of Dante's character.)

In 1817-18 Dante appears to have been still wandering about Italy. In 1819 he repaired to Guido da Polenta, lord of Ravenna, where he was hospitably received, and where he appears to have remained till his death, which happened in September 1821. He was buried in the church of the Minorites, under a plain monument. Bernardo Bembo, senator of Venice and podesta of Ravenna, raised to him a mausoleum in 1483, which was afterwards repaired in 1692 by Cardinal Corsi, of Florence, and lastly in 1780 reconstructed altogether in its present form by Cardinal Valenti Gonzaga, legate of pope Pius VI. The reproof—

"Ungrateful Florence! Dante sleeps afar,"

was at last felt by the Florentines; a subscription was made and a monument was raised to the memory of Dante in the church of Santa Croce, which was opened to public view with great solemnity on the 24th of March 1830. (Missirini, 'Delle Memorie di Dante in Firenze, 1830.)

Of the manner in which the whole manuscript of Dante's poem was found, collected, transcribed, and published after his death by his sons Jacopo and Piero, the early commentaries on the poem, its early printed editions, and the whole bibliographic history of the work, the reader will find ample information in Foscolo's 'Discorso sul testo di Dante,' London, 1825; and also in Missirini, 'Rivista delle varie Lezioni della Divina Commedia, e Catalogo delle più importanti Edizioni,' Padova, 1832. Among the most complete editions of Dante's poems are: that of Venice, 5 vols. 4to, 1757-58, with ample notes, and including Dante's Life, by Pelli, and his minor poems and prose works; Lombardi's edition, Rome, 3 vols. 4to, 1791; and that of Florence, with illustrative plates, 1819, 4 vols. fol. Among the host of commentaries the one called 'l'Anonimo,' and also 'l'Ottimo,' written by a contemporary of Dante, who was evidently familiar with the poet, has been published for the first time at Leghorn in 3 vols. 8vo, 1827.

Among the numerous translations of the 'Divina Commedia,' in almost every language of Europe, that in English blank verse by Cary, and the English prose version by Dr. J. A. Carlyle, deserve to be mentioned with especial praise. An Italian translation of Dante's philological treatise, 'De Vulgari Eloquio,' was published by Trissino in 1529; and the Latin text in 1577: this work has occasioned a very animated controversy between Italian philologists in our days.

DANTON, GEORGE JAMES, born at Arcis-sur-Aube, October 26, 1759, was one of the most remarkable characters among the leaders of the first French Revolution. He was educated for the bar, and was pursuing the peaceful avocation of a king's counsel when the first shocks of the great political earthquake called him upon the revolutionary arena. Danton was gifted by nature with those faculties which qualify a man for the dangerous office of a political agitator. He was tall and muscular, his features were harsh and striking, and his voice resembled the roaring of breakers or the growling of the thunder. He was ambitious and bold; his eloquence, the offspring of an impassioned imagination, though without the charms of rhetorical

elegance and philosophical depth, was overwhelming by its vehemence. His energy, activity, and courage were unbounded: he seemed to be the very incarnation of the revolutionary spirit. It is no wonder that such a man soon became the leader of popular commotions and the terror of all who dared to oppose him.

In 1790, supported by the revolutionary club of the Cordeliers, founded by himself, he presented to Louis XVI. the petition of the forty-eight sections of the town of Paris against the king's ministers, accusing them of having lost the confidence of the nation. In 1791 he was elected member of the departmental administration of the Seine. After the imprisonment of Louis at Varennes, he was the prime mover of the popular assemblage of the Champs de Mars, in which he called for the dethronement of the king. On the 8th of August 1791, he presented himself before the legislative assembly, and with unprecedented audacity told the representatives of France that their refusal to declare the throne vacant would be the signal for a general insurrection. The fate of Louis was decided, and Danton being elected minister of justice, became the head of that body of six men who were intrusted with absolute executive power. In this capacity he showed himself blood-thirsty, ambitious, vindictive, and it is said venal; but he was also courageous and skilful in conducting public affairs at a time when every step was attended with danger.

When the Prussian army had entered France, and consternation began to spread in all quarters, when the leaders of the republican party were at a loss what to do to avert the impending hurricane, Danton ascended the tribune, and addressing the convention in one of the most impassioned speeches ever uttered by a popular leader, he ended with these eventful words:—"The country is in danger; to avert the crisis one thing only is needful—boldness, incessant boldness, nothing but boldness." These words acted like a spell upon the French nation; within a few weeks fourteen republican armies stood upon the field of battle, and repelled with unexampled bravery the aggression of the allied forces.

If Danton had turned his energies only against the enemies of his country, his memory might have passed unsullied to posterity: but he allowed his wild passions to rage against his fellow-citizens; and most of the horrors of the French Revolution, particularly those of the days of September, were originated, supported, or encouraged by him. After the abolition of royalty Danton gave up the office of minister of justice for that of a president in the constituent committee and in that of Public Safety. While discharging these functions he prepared public opinion for the decapitation of the king. When the tribunal whose business it was to pass the sentence of death was sitting, Danton was absent; but he returned in time to vote for the king's execution. Like Sieyès, he gave no reason for his vote.

In the meantime the people of Paris, or rather the party which was headed by the clubs of the Jacobins, had chosen another leader, who in his private conduct was the opposite of Danton, and in his political views his most powerful antagonist. This was Robespierre, a man of singular character, who combined with great personal purity and disinterestedness a stern, profound, uncompromising political character, and the most inveterate malignity towards all who crossed his path or wounded his intense self-love. Danton, though more free in his private life, was kind and generous in temper, frank, unreserved, and unselfish, and if there be truth in the assertion of his enemies that he sought to turn to his own pecuniary advantage the opportunities afforded by his position, it is certain that he could have done so but to a small extent and with little success, for he lived in comparative poverty, and left almost nothing for his family at his death. But there can be little doubt that he was a self-indulgent man, and his manner of life was one likely to be especially offensive to a man of austere habits like Robespierre, who from the first hated as well as envied him. On the other hand, Danton shrunk with something like dread from Robespierre. He had lost his old energy and decision, or could not put them forth in a personal contest. Robespierre was never more thoroughly in earnest. Foreseeing that if he continued in the capital there must come a struggle the issue of which could not in the present state of affairs be doubtful, Danton withdrew from the theatre of political action, stigmatising his rival by the name of "ultra-revolutionist." He had married a young wife, and he was easily persuaded by her to seek happiness in domestic privacy. When summoned to give an account of his financial administration, he refused to submit to such examination, unless his five colleagues were also compelled to do the same, and retired to his native place. Efforts were made to bring about a reconciliation between Robespierre and Danton, and the two master-spirits of the revolution met, but there was no friendliness on either side. Robespierre reproached Danton with malversation, and Danton retorted by charging Robespierre with his cruelties: and they parted avowed and irreconcilable enemies. The friends of Danton urged him to strike the first blow or to seek safety by flight. He refused both. He knew, he said, that his death was resolved on, but he would neither fly nor turn executioner. He was denounced by St. Just as a traitor before the Comité de Salut Public, and arrested on the night of the 31st of March 1794. He was carried before the Revolutionary Tribunal on the 2nd of April, along with Desmoulins, Chabot, and twelve others of the Dantonists. The trial was of course a mere mockery; Danton spoke loudly, and on the plea that he was endeavouring to excite the populace he was ordered to be silent; no

witnesses were called against him, his own witnesses were refused to be heard, and he and all his companions were declared to be guilty. They were executed on the 5th of April. Danton, only for a moment shaken by the recollection of his young wife, died with undaunted courage. He belonged to the school of the French materialists, and did not believe in the immortality of the soul. "Soon," said he to the executioner, "I shall fall back into my original nothingness; yet my name shall live for ever in the pantheon of history."

D'ARBLAY, MADAME, originally *Miss Frances Burney*, was born at Lynn-Regis, on the 13th of June 1762, and was the second daughter of Charles Burney, Mus. Doc., the author of the 'History of Music,' who was then organist in that town. Her mother, whom she lost when she was about nine years old, was partly of foreign descent, her maternal grandfather having been a French Protestant, who left his native country on the revocation of the edict of Nantes. Madame d'Arblay has given her own account of her early life in her 'Memoirs of her Father.' She there assures us that she was so backward when a child, that at the age of eight she was still ignorant of her letters. By the time that she was ten, nevertheless, she had begun of her own accord to exercise her talents in composition, and she was soon incessantly busy in scribbling "elegies, odes, plays, songs, stories, farces, nay, tragedies and epic poems"—her confidante at this date being her youngest sister Susannah. At fifteen she burned all her early performances; but one of them, the 'History of Caroline Evelyn,' kept possession of her memory and fancy, and gave rise to her conception of a sequel to it in the story of the daughter of her former heroine. This, we are told, was all "pent up in the inventor's memory" before she committed any of it to paper; she then wrote down two volumes of it in a feigned hand, and employed her brother to offer them to a publisher. Dodsley declined the work as anonymous; Lowndes, as unfinished. Upon this she completed it by dictating to her brother a third volume. Lowndes gave her 20*l.* for the manuscript; and it was published under the title of 'Evelina, or the History of a Young Lady's Introduction to the World.' The impression left upon the reader by this detailed account is, that 'Evelina' was written and published no very long time after the burning of the earlier story of 'Caroline Evelyn'; and indeed it used to be generally understood, and has been repeatedly stated, that Miss Burney was only about seventeen when this her first novel appeared. The fact is, that it was published in the year 1778, when she was six-and-twenty. She goes on to inform us that it was written and given to the world without the knowledge of any of her other relations except her sister and her two brothers; that she merely told her father, who used to employ her as his amanuensis (on which account she had employed the disguised hand in writing out the first two volumes), that she was going to print a little book; that the work had been six months published before he knew that it was hers; that she sat as a listener with the rest of the family while it was read through at a friend's house, where she was visiting, without her concern in it being suspected; but that after a little time it began to make a great stir, passing from the favourable criticism of the Monthly Reviewers into the hands of the beautiful Mrs. Bunbury, from her to the Hon. Mrs. Cholmondeley, from her to Reynolds, Burke, Johnson, and Mrs. Thrale. By the time however that it reached these last the authoress was known, and they were her father's intimate friends, and naturally disposed to admire and applaud. They appear in fact to have vied with one another in the enthusiasm with which they extolled the work, and hailed the wonderful genius who had suddenly started up among them. And 'Evelina' would no doubt have been in some respects a surprising production for a girl in her seventeenth year; but it is still more surprising, upon the whole, as that of a young woman in her twenty-sixth. It is most probable however that it belongs not exactly to either extreme, but, that commenced early, it was revised and completed later; as there is no doubt of the third volume having been added at the requisition of the publisher—the negotiations with the booksellers commencing in 1776. The most striking characteristic of the work is the immaturity of mind which it displays, the girlishness of conception that pervades it, the want of the power of penetrating beyond the outside shows and forms of things, the incapacity of appreciating motives and probabilities, the inconsistencies in the construction and movement of the story, and of the conduct at every turn of the persons figuring in it. There is fluency indeed, and some occasional vivacity, but much of it is made up of practical jocularities, and often of exaggeration and the lowest farce. The chief merit is a lively description of the manners and the tone of conversation of the period. Miss Burney had certainly a strong sense of humour; this is shown in her 'Diary and Letters'; but in all her novels it too often degenerates into mere, and sometimes vulgar, caricature. Her second novel, 'Cecilia, or the Memoirs of an Heiress,' appeared in 1782. It is in 5 vols., and is a considerable improvement upon 'Evelina.' For more than a dozen years after the publication of 'Cecilia' the fair writer laid aside her pen. In July 1786 she was appointed one of the dressers or keepers of the robes to Queen Charlotte, and this situation she held for five years. In July 1793 she married M. Alexandre Piochard d'Arblay, a French emigrant artillery officer; and the same year she published an 8vo pamphlet, entitled 'Brief Reflections relative to the Emigrant French Clergy.' In 1795 her tragedy of 'Edwy and Elgiva' was brought out at Drury Lane; but it was

speedily withdrawn, and was never printed. The next year she produced another five volume novel, 'Camilla, or a Picture of Youth,' which she published by subscription, thereby realising, it is said, above three thousand pounds. It is not rated by her admirers so high as either of its predecessors. In 1799 she produced a comedy, 'Love and Fashion,' which was accepted by Mr. Harris of Covent Garden, but subsequently withdrawn at the request of her father; but she did it unwillingly, telling him she had all her life intended writing a comedy, and did not fear failure.

After the peace of Amiens in 1802, her husband and she went to Paris; and M. D'Arblay having given in his adhesion to the existing government, they remained in France. In 1812 however Madame D'Arblay found means to pass over to her own country; and she had thus the satisfaction of again seeing her father, who survived till 1814, when he died at the age of eighty-seven. Meanwhile she had in the same year published her fourth and last novel, 'The Wanderer, or Female Difficulties,' in five volumes, for which the bookseller is said to have given her 1500*l.*; but it met with little success, and is considered the poorest of her performances. On the restoration of the Bourbons her husband was raised to the rank of general, and in 1814 Madame D'Arblay joined him in Paris. On the return of Napoleon in 1815 General D'Arblay set out for his regiment, and urged his wife to leave Paris at once. She did so, and tells the tale of her escape to Brussels in her 'Diary' with all the sentimentality of one of her own heroines. They met again at Brussels just previous to the battle of Waterloo, but on the return of the Bourbons, M. D'Arblay, who had been injured by the kick of a horse, determined to take up his residence in England. They settled in Bath, where in 1818 the general died. In 1832 she once more came before the world through the press with three octavo volumes of 'Memoirs of her father, Dr. Burney.' This work was unlike anything she had previously written, as much in manner as in subject; instead of the fluent, familiar style of her novels, she surprised her former readers and the public in general by a pompous, indirect, long-winded, drawing diction, apparently intended as an improvement upon Johnson or Gibbon, but having rather the effect of a ludicrous though unintentional caricature. The book however contains many interesting anecdotes. In 1837 Madame D'Arblay lost her son, the only issue of her marriage, the Rev. Alexander Charles Louis D'Arblay; he was a fellow of Christ's College, Cambridge, and perpetual curate of Camden Town Chapel, and he had published several single sermons. Her own death followed at Bath on the 6th of January 1840. From 1835 to the period of her death, her health had been failing, and she suffered from a disorder in the eyes, which rendered reading and writing painful. The entries in her 'Diary' became few, and there is no entry beyond 1839. In 1842 five volumes of her 'Diary and Letters,' edited by her niece, were published, and the work was completed in two more in 1846, and it has since been reprinted. This 'Diary,' though much of it is frivolous enough, is on the whole an extremely curious record. It commences in 1778 with her account of the publication of 'Evelina,' and of her feelings on the reception of the flattery which poured in on her from every side. Her description of the domestic life of George III. and his family, of the miseries and fatigues attendant on her own position in it, of the absurd formalities observed, as inconvenient to the exactors as to the sufferers, forms a highly interesting portion of it; and many of the conversations recorded do not surpass in intelligence or polish some of those introduced into her novels. On the whole, the picture it presents of several departments of English life and society in the latter part of the last century is the most ample and the most distinct that has anywhere been given. (*Gen. Mag.* for Aug. 1840; *Memoirs of Dr. Burney; Diary and Letters.*)

* DAREMBERG, CHARLES VICTOR, was born at Dijon in the department of the Côte-d'Or, on the 14th of April 1817. Educated for the profession of medicine, he received the degree of Doctor in 1841, taking for his thesis on examination the anatomy and physiology of Galen. His labours appear to have been thus early directed to the course he has since sedulously followed, a development of the medical and surgical practice and theories of the ancients. In 1843 he was appointed librarian of the Académie de Médecine, and in 1845 was charged with a mission to Germany and Belgium to procure the materials for a grand collection of Greek and Latin medical works, and for a history of the literature of medical science. In 1847-48 he visited England with the same object. In the latter year he delivered a course of lectures on the history of the literature of medical science. In the following year he was appointed librarian of the Mazarine library. Since that time M. Daremberg has paid repeated visits to England, Germany, and Italy, in connection with the many important works he has published, either alone or in connection with others. The following are a few of them: 'Exposition des Connaissances de Galien sur l'Anatomie et la Physiologie du système nerveux,' 1841; 'Œuvres choisies d'Hippocrate,' 1843, second edit. 1855; 'Traité sur le Poulx, attribué à Rufus d'Éphèse,' 1846; 'Fragments du Commentaire de Galien sur le Timée de Platon,' 1847; 'Œuvres de Oribase,' 2 vols. 1851-54, by himself and Dr. Bussemaker, with several others on cognate subjects, and some translations from the German.

* DARGAN, WILLIAM, a native of Ireland, in extensive business as a builder and railway contractor, has had his name brought prominently before the public of late years, chiefly in consequence of his

patriotic exertions and sacrifices in connection with the Industrial Exhibition at Dublin in 1853. Mr. Dargan is the son of a farmer in Carlow county. Early in life he was employed in the office of a surveyor, where his conduct was marked by integrity and assiduous attention to his duties. For some time he was employed under Telford in the construction of the Holyhead road, after which he returned to his native country, and by the prudent and skilful management of his business, he succeeded in securing for himself an important position among the large contractors for public works in Ireland. He executed the first railway opened in Ireland, and he has since been engaged in the promotion and construction of numerous railways, roads, and canals. As already stated, it is to Mr. Dargan's patriotic liberality that Ireland is mainly indebted for the Dublin Exhibition of 1853. The Great Exhibition of 1851 in London, followed by the Cork Exhibition of 1852, led Mr. Dargan to devote a sum of 20,000*l.*, which, as the plans were gradually extended, was eventually increased to a much greater amount, for the purpose of converting the usual triennial Exhibition of Arts and Manufactures in Merrion Square, Dublin, into a truly national exhibition. The Royal Dublin Society entered warmly into Mr. Dargan's project, and a building was erected, which was opened on the 12th of May 1853, by the Lord-Lieutenant of Ireland. The office of Chairman of the Executive Committee was given to Mr. Dargan, and the result was gratifying to his feelings as an Irishman, although the speculation left him a loser to the amount of several thousand pounds. The Exhibition was visited by her Majesty and Prince Albert in September; and the general estimate of Mr. Dargan's conduct in connection with the enterprise, was well represented by the desire expressed by her Majesty to confer upon him at the close of the Exhibition the honour of knighthood, an honour which was declined by Mr. Dargan: some progress has been made in the founding of a 'Dargan Tribute' in the shape of a permanent gallery of art in Dublin. The Tower, Mount Anville House, near Dundrum, was erected by Mr. Dargan, and is occupied by him as his country residence.

DARIUS, the name of several Persian kings. Darius I., commonly called Darius Hystaspis, or the son of Hystaspis, belonged to the royal house of the Achæmenide, and mounted the throne B.C. 521, after having, with six other conspirators, despatched the usurper Smerdis. It was one day agreed among them, according to Herodotus (iii. 82, 83), that they should assemble on the following morning before sunrise on horseback, and that he whose horse neighed first to the rising sun should be king: the horse of Darius neighed first, and Darius was saluted king (iii. 84-87). Darius was in fact the founder of the Persian constitution; to him is due the consolidation of the Persian empire. Countries which Cyrus and Cambyses had only subdued he first organised into a systematic kingdom. He divided his vast empire into twenty satrapies or provinces, and appointed a fixed tribute to be paid, as well as a regular supply to be sent for the provisions of the army and the king's household (iii. 89-90). A system of communication between different parts of the empire was established by means of couriers stationed at certain distances for the transmission of the royal messages, and he devoted much attention to public works and to administrative improvements.

Soon after his accession to the throne, Darius was visited by Syloson, the brother of Polycrates, tyrant of Samos, who reminded him of the cloak with which he had obliged him in Egypt, when acting as one of the guards of Cambyses. Darius offered him any reward he would name: he asked to be restored to Samos, and put in possession of the kingdom of his late brother. Darius sent Otanes with an army to Samos, and soon succeeded in reducing the island. Menedotus, who was in possession of it at the time, was allowed to quit it (iii. 139-141). Meanwhile the attention of Darius was called off to another and more important affair. The Babylonians had revolted, and made great preparations for resistance. Darius marched against them with considerable force, and besieged them for a year and eight months, but without success, till the artifice of Zopyrus put him in possession of the city. Zopyrus, one of the officers of Darius, after cutting off his own nose and ears, and lacerating his body in a frightful manner, went over to the enemy, telling them that this was the treatment he got from Darius, and he had therefore come over to them that he might aid in taking revenge on the tyrant. The Babylonians received him gladly, and not doubting for a moment the truth of his story, gave him an important post of command, and soon entrusted to him the whole city, which he delivered up to Darius. Darius impaled 3000 of the chief citizens, and destroyed the walls and gates of the city (iii. 150-160). Darius employed the Greek navigator, Scylax of Caryanda, to follow the Indus to the ocean and to survey the country (iv. 44); and the discoveries which he made were followed by the subjugation of a portion of the Indians (iv. 44; iii. 101). One of the principal events in his reign was his expedition against the Scythians. He marched against them with a force which is computed at seven or eight hundred thousand men. A bridge of boats was laid across the Bosphorus, and the work was executed by Mandrocles, a Samian, who received a present from the king as a reward for the skill which he displayed (iv. 85-87). Darius pursued his march through Thrace, across the Danube, to the Don, but met with very ill-success, and had great difficulty in escaping eventually. He returned to the Danube, recrossed it, and came back into Asia, leaving Megabazus in

Thrace with orders to subdue the Pæones (v. 12-16). Megabazus subdued them and transported them into Asia, where Darius allotted them a district in Phrygia.

In 501 B.C. some disturbances arose in the island of Naxos, which ended in the aristocratical party being obliged to quit the country. They applied to Aristagoras, governor of Miletus, for succour, which he was willing to afford, but was unable to grant without the aid of the Persians. Aristagoras communicated the scheme with splendid promises of success to Artaphernes, the king's brother and governor of Sardis, who, after procuring the king's consent, entrusted a fleet of two hundred ships to the command of Megabates, and ordered it to sail to Miletus to take on board the forces of Aristagoras. After a four months' siege their funds were consumed, and Aristagoras had contracted a debt with the Persian government which it was wholly out of his power to discharge. An insurrection of the Ionian states, whom he had excited to revolt, speedily followed, and ended in the fall of Miletus, B.C. 494.

The Athenians had given Aristagoras aid in the revolt, and had thus excited the bitter hostility of Darius, who sent, under the command of Datis and Artaphernes, an army to Attica, where they were opposed and defeated by Miltiades in the plain of Marathon B.C. 490. (Herod. vi. 113-17). The conquered Persians returned to Asia. Darius began to make preparations for another expedition against the Greeks, as well as for reducing the Egyptians, who had rebelled, but he died before the commencement of the war, B.C. 485, after a reign of thirty-six years (vii. 4; Clinton, 'Fast. H.' ii. 313). He appointed his son Xerxes his successor. (Herod. vii. 3.)

Before he became king Darius had three sons, two of whom are mentioned (vii. 2-97), Artabazanes and Ariabignes. After his accession he had four sons by Atossa, and several other wives.

DARIUS II., called Darius Ochus, or Nothus, because he was the illegitimate son of Artaxerxes. Soon after the murder of Xerxes II., Darius succeeded in deposing Sogdianus, and ascended the throne himself, B.C. 423. By his wife Parysatis he had Artaxerxes Mnemon and Cyrus the younger. Nothing very remarkable occurred during his reign, but some successful wars were carried on under Cyrus and other generals. He died B.C. 404, after a reign of nineteen years, and was succeeded by his son Artaxerxes, who is said to have asked him on his death-bed by what rule he had acted in his administration, that he might adopt the same and find the same success. The king's answer is said to have been, that he had always kept, to the best of his knowledge, the strict path of justice and religion. (Xenophon, *Anabasis*, i. 1.; Diodorus, xii. 71; Justin, v. 11.)

DARIUS III., or Codomannus, the last of the Persian monarchs, succeeded Artaxerxes III., B.C. 336, after a short interval, in which Arses, the youngest son of Artaxerxes, was nominally king. Bagoas had poisoned Artaxerxes, and then put Arses on the throne that he himself might reign in his name; but after two years he deposed him, and put in his place Darius Codomannus. Darius not being so obsequious to his wishes as he desired, he determined to remove him in the same way as he had done with Artaxerxes. The king however, aware of his design, made Bagoas himself drink the poison which he had prepared for him. Darius was now firmly established on the throne, but had little time to enjoy his security before he found himself opposed by Alexander the Great.

It was in the second year of Darius's reign that Alexander passed over the Hellespont into Asia: he pursued his march till he arrived at the river Granicus (now the Gostvola), when his first encounter with the Persian army took place. The well-armed and well-disciplined troops of the Macedonians gained a complete victory. Another battle was fought at Issus in Cilicia, where Darius took the command himself, and was utterly defeated. He engaged in person again in a battle at Gaugamela, commonly called the battle of Arbela, and was defeated. After the battle of Issus, Darius's camp was plundered, and his wife, mother, and children, came into the hands of Alexander, who treated them with the utmost consideration and care. Now that Susa, Persepolis, and all his treasures had come into the possession of the conqueror, Darius took refuge in Ecbatana, but was seized by Bessus, the governor of Bactria, who betrayed him in his misfortunes. Both the traitor and his prisoner fled before the march of Alexander, who hastened the pursuit till he came in sight of them, when they fled precipitately; and because Darius would not follow them, Bessus and those about him discharged their darts at him, and left him covered with blood at the mercy of the Macedonians. When the Greeks found him in this state he had just strength enough left to ask for some water to drink; it was given him by a Macedonian, whom he requested to return his thanks to Alexander for the kindness he had shown to his wife, mother, and children, and to say that he prayed the gods to prosper him in all his undertakings, and to make him monarch of the world.

Alexander himself came up soon afterwards, and was much affected at seeing the king in this deplorable state. He took off his own cloak and spread it over the corpse, which he ordered to be embalmed and sent in a splendid coffin to Sisigambis, to be interred with the other monarchs of Persia. Darius died B.C. 330, in the sixth year of his reign and the fiftieth of his age. He enjoyed the reputation of a just and humane prince. With Darius ended the empire of Persia, which had lasted for upwards of two hundred years under thirteen kings.

(Diodorus Siculus, xvii. 5-77; Plutarch, *Life of Alexander*; Justin, x.)

DARU, PIERRE ANTOINE NORL BRUNO, COUNT, was born at Montpellier, January 12th, 1767. He was educated in the military academy at Tournon, then directed by the fathers of the Oratory, and very soon distinguished himself by his proficiency in literary exercises. Though destined for an administrative career, he received a brevet as lieutenant of artillery when only seventeen years of age. In 1788 he became secretary to Count Perigord, and was engaged in regulating the taxes in Languedoc, but did not throw aside his literary habits. He translated some of the Latin classics, and wrote an epic poem in twelve books, entitled 'Washington, or the Liberty of North America.' In 1791, after having defended himself against a charge of royalism, he was appointed intendant in the army appointed to act in Brittany against the expected attack of the English. Here he became again suspected, through a ludicrous misunderstanding of an intercepted letter, in which he had said, "Here I wait for our friends the English, who are said to be expected to arrive soon." Notwithstanding the frivolousness of the cause, he remained a prisoner till the fall of Robespierre restored him to freedom, employing his enforced leisure in translating the Odes and Epistles of Horace, and writing a poem on his jailer, 'Épître à mon Sans-Culotte,' which was published several years afterwards.

In 1796 he resumed his official occupations, and as chef-de-division honourably distinguished himself by endeavouring to repress the illicit profits and the rapine so common at that time in all the departments of government. In 1799 he was made intendant of the army in Switzerland under Massena, and most ably and industriously fulfilled the difficult duties which devolved on him, while he yet found time to finish Horace by translating the 'Satires,' and to write a poem on the Alps, and a 'Chant du guerre,' that was set to music by order of the minister of the interior. He soon after became secretary of war, and was charged with the task of improving the military organisation. The plan was chiefly prepared by Daru, but it was signed by Berthier. Bonaparte however had a plan of his own, to which Daru's was forced to give place, though he defended it with a firmness which made a favourable impression on the First Consul. In 1802 as a member of the Tribunal, where he spoke strongly and eloquently in favour of public instruction and on the monetary system, and took an active part in the discussions generally. He also supported before the legislative body the law for a conscription as a measure favourable to public liberty. In 1805 he was named a councillor of state, and general intendant of the imperial household. He hesitated to accept this office. "I have passed my life," he said, "among books, and have not had time to learn the functions of a courtier." "Of courtiers," replied Napoleon, "I have plenty around me; they will never fail. But I want a minister, at once enlightened, firm, and vigilant; and it is for these qualities that I have selected you." Under the emperor, Daru was fully employed; sometimes in the administration at home, at others in foreign missions. After the battle of Jena he acted as intendant of the army; he was entrusted with the execution of the treaty of Tilsit, and directed the evacuation of Warsaw and of the Prussian territories; he was ambassador to the king of Prussia; he was commissioned to carry into effect the provisions of the treaty of Vienna after the battle of Wagram; and he opposed the Austrian marriage of Bonaparte, recommending rather that he should choose a Frenchwoman, because his "throne was not founded on the same basis as that of the other sovereigns of Europe;" an opinion that has been adopted in spirit by the present emperor of the French. Daru had now become the confidential friend of Napoleon, and a number of familiar retorts are recorded of him. When the triumphal arch in the Carrousel was erected it was severely criticised. "Does not everybody speak ill of my triumphal arch?" inquired the emperor. "Excuse me," replied Daru, "I have heard two praise it, yourself and the architect."

Daru at length, on the retirement of the Duke of Bassano, became the prime minister of Napoleon; his labour was immense, his position high, but he remained the same modest, honourable, and disinterested man as before. In 1812 he strongly opposed the expedition against Russia, saying it was not men he feared, but nature. When however the war was definitively resolved on, he took the most prompt and active measures for rendering it successful. On the disastrous issue of the campaign he prepared for that in Saxony with the same zealous activity; and during the succeeding events remained firm to his imperial master. He advocated the defending of Paris against the Allies; he opposed the removal of the government from Paris; he followed the empress to Blois; and after the abdication of Napoleon at Fontainebleau he retired from public life. He was exiled by the first royal government, and retired to Bourges, whence he was recalled in 1819 and made a peer of France. He occasionally appeared and spoke in his legislative capacity, but his time was now almost entirely devoted to literature. He died Sept. 5, 1829.

Count Daru's literary works are numerous; the best known in England is the 'Histoire de la République de Venise,' 1819, in 7 vols., which has been frequently reprinted. Among others are 'La Cléopédie, ou la Théorie des Réputations Littéraires,' 1809; 'Histoire de Bretagne,' 1826, 3 vols.; a number of speeches delivered in the legislative chambers, and many poems, some of them of considerable length.

DARWIN, CHARLES, F.R.S., an eminent living naturalist. He

is not only distinguished for his scientific discoveries in geology and zoology, but for his elegant popular work entitled 'The Voyage of a Naturalist,' which has made his name familiar wherever the English language is read. This work is the record of a voyage made by H.M.S. 'Beagle,' under the command of Captain Fitzroy, R.N., from the years 1832 to 1836. Mr. Darwin was attached as naturalist to this expedition, and profited by the great opportunities it afforded him of observing the physical geography of the earth and the habits and structure of its animal inhabitants.

Most of Mr. Darwin's works have been written since the voyage of the 'Beagle,' and all of them bear evidence of his great industry in collecting and observing the facts which were presented to him during his travels. One of the earliest of his scientific labours was his 'Journal of Researches into the Geology and Natural History of the various Countries visited by H.M.S. Beagle.' This was published in 1839. In this work he has given a general view of the natural history of the countries he visited. In subsequent works however he has elaborated highly interesting general views as the result of his special observations. Thus, in his 'Geological Observations on South America,' published in 1846, he presents the phenomena afforded by the South American continent in connection with a general theory of the causes of geological changes in this part of the world. The same may be said of his papers on the volcanic islands of Australia, on the distribution of the erratic boulders, on the unstratified deposits of South America, on the geology of the Falkland Islands, on the areas of elevation and subsidence in the Pacific and Indian Oceans, all of which have been published in the 'Transactions,' or in the 'Journal of the Proceedings of the Geological Society.' His geological writings claim for him a position among the most distinguished geologists of the present day. He is a Fellow of the Geological Society, and was formerly one of its secretaries.

His zoological publications have given him no less a position as a zoologist. His separate papers on zoology are not numerous. He has contributed an interesting paper on the formation of mould by the agency of the earth-worm to the 'Transactions of the Geological Society.' He also wrote the introduction, and many of the notes, to the 'Zoology of the Voyage of H.M.S. Beagle,' published by the government from 1840 to 1848. He has also published several papers on various departments of zoology in the 'Annals' and 'Magazine of Natural History.' His great work however, and that on which his reputation as a zoologist is founded and will probably depend, is his 'Monograph of the Family Cirripedia;' this family includes the animals commonly known as Barnacles and Sea-Acorns. Mr. Darwin, in this work, has given an accurate definition of every known species. In addition to this, he has pointed out several very curious facts in the history and economy of these animals. The excellent style, the great addition made to the existing knowledge of the family to which it is directed, and the remarkable caution exercised by the author in coming to his conclusions, render this work a model of the manner in which such works should be written. It has been characterised by a competent writer as one of the most remarkable works on zoology produced during the present century. This work, which is in 2 vols. 8vo, was published by the Ray Society, and distributed to their subscribers in the years 1851 and 1853.

In the second volume of Agassiz's 'Bibliographie Geologie et Zoologie,' published by the Ray Society in 1850, the number of Mr. Darwin's papers and works mentioned is twenty-two.

All this labour has been performed under most disadvantageous circumstances; for Mr. Darwin returned from his voyage round the world with shattered health, which rendered it impossible for him to pursue his literary and scientific labours without considerable interruption. Mr. Darwin (1856) is still in the prime of life, and may therefore be expected to contribute largely to the extension of the sciences he has so successfully cultivated.

DARWIN, ERASMUS, an English physician and physiologist, was born at Elton, near Newark, on the 12th of December 1731. After studying at St. John's College, Cambridge, and taking the degree of Doctor of Medicine at Edinburgh, he established himself as a physician at Lichfield, where he married, and resided till after the death of his first wife, by whom he had three sons. In the year 1781, having again married, he removed to Derby, where he died on the 18th of April 1802, in the seventieth year of his age. He is said to have been a man of an athletic person and of temperate habits, the advantage of which he lost no opportunity of pointing out to those over whom his influence extended. His biographers give him credit for having done much service to the poor of Lichfield in this respect.

Dr. Darwin claims a place in this work as a general physiologist and a poet. In the year 1781 he published his 'Botanic Garden,' a poem in two books; in 1793 his 'Zoonomia, or Laws of Organic Life,' which was succeeded in 1796 by a continuation of the subject, the whole forming two volumes in quarto; and in 1800 his 'Phytologia, or Philosophy of Agriculture and Gardening,' in one volume quarto of rather more than 600 pages. All these works have excited considerable attention; by some they have been extravagantly praised, by others as unreasonably depreciated, and at the present day they are little read or consulted. Nevertheless they are far from deserving to sink into neglect and oblivion. The author was unquestionably a

man of a highly original turn of mind; he was unusually well read in the physics of his day; he had a singular aptitude for seizing and illustrating natural analogies, and above all he was fully impressed with a sense of the important truths of a universal simplicity and harmony of design throughout the whole creation. It is true that his analogies are often imaginary, his theories untenable, and his illustrations overstrained, but many of these errors were inevitable in the state of natural history in his day, and the others are by no means sufficient to overbalance his claims to fame as a clear-sighted, ingenious, and often profound physiologist. Darwin's 'Botanic Garden' is divided into two books, very unequal in size and in merit. The first, which explains the principal phenomena of vegetation, is superior in every respect to the second, which is devoted to what he calls 'The Loves of the Plants,' which, forming a poetical commentary upon some of the more curious phenomena of vegetable fertilisation, is filled with the most ludicrous analogies and imagery. That the character of the 'Botanic Garden' as a poem is by no means of a high order must, we think, be on all hands allowed, for its language is often tawdry and tinselly, its similes extravagant, and its machinery in the highest degree fantastical as well as incomprehensible; but on the other hand it abounds with passages which have seldom been excelled for their elegant and forcible description of natural objects in poetical language, and it can by no means be admitted that where an author's powers are expended upon an illustration of the laws of any part of the creation, they are applied to mean and insignificant subjects. It is only where he calls to his aid the fancies of the Rosicrucians that he wastes his talent and fatigues his reader. His 'Phytologia' is remarkable for the number of novel and ingenious ideas which it contains: many of these were too far in advance of those of his contemporaries to be much esteemed when they appeared, but they are singularly in accordance with opinions which now are either altogether recognised, or are under discussion, with a strong probability of being finally adopted. For instance, he particularly insisted upon the close analogy between plants and animals in their functions, showing that the difference between the two kingdoms is the necessary consequence of the difference between their wants, necessities, and habits of life. He urged with great force that every bud of a plant is the seat of a separate and in some measure independent system, that plants are therefore in one sense congeries of individuals living in concert but growing independently; finally, he pointed out the analogy between buds and seeds, showing that the woody part of plants is really analogous to the roots of seeds, and produced by the adhesion of the descending matter of organisation which passes downwards from the buds. While however we thus give Darwin credit for a rank in science that has hardly been accorded to him before, we are bound to add that his errors were neither few nor unimportant. He was too fond of tracing analogies between dissimilar objects; he readily adopted the ingenious views of others without sufficient inquiry; he had the great fault of being often a credulous collector and a fanciful reasoner, and finally his prose writings are often inexcusably inelegant, ill-arranged and ungrammatical.

DASHKOV, EKATERINA ROMANOVA, a Russian princess, remarkable for her singular character and career, was the daughter of Count Roman Larionovich Vorontsov, and was born according to her own statement in 1744. If this be correct, at the age of fifteen she was married to Prince Dashkov, and at the age of eighteen she was the principal agent in a revolution which changed the face of Russia. The Grand Duke Peter, averse to his wife the Princess Catharine [CATHERINE ALEXIENNA], had formed the plan of repudiating her and of raising his mistress, Elizabeth Vorontsov, to her place. It was Elizabeth's sister, the Princess Dashkov, who, according to her own statement, first suggested to the grand duchess the idea and the means of thwarting the plan; she was according to all accounts the soul of the conspiracy that was entered into, and she, a woman, took the principal part in the insurrection of 1762, which dethroned Catharine's husband, now become the Emperor Peter the Third, and raised Catharine to the imperial throne. She was not long however in losing the favour of the empress, whom she displeased by the independence of her character and the bluntness of her manners, and it was even with some difficulty that after she had lost her husband she obtained permission in 1768 to travel abroad. In a somewhat lengthened tour, which carried her over Germany, England, France, and Italy, she became acquainted with many of the leading literary men of the various countries, and we find among her correspondence letters from Garrick, Dr. Blair, and Dr. Robertson, with the last of whom she was desirous of placing her son for the purpose of education. She was partial to England, and her brother, Count Simon Vorontsov (or, as the name is often written, Woronzow), who was for some time ambassador here, was so much so that, after giving up the embassy in 1806, he resided in London till his death in 1832. His son, at present (1856) high in the Russian service, and lately governor of the Caucasian provinces, was educated in England, and his daughter, the princess's niece, is the present Countess Dowager of Pembroke. On the Princess Dashkov's return to Russia in 1782, she found herself again in favour with the Empress Catharine, who had probably discovered in her absence, that a little freedom of character relieves the tedium of a court. One of their bonds of union was a strong partiality to literary occupation in both.

The empress however somewhat amazed the princess by the proposal to appoint her to the presidency of the St. Petersburg Academy of Arts and Science, and she at first replied that a more appropriate appointment would be that of 'Directress of her Majesty's Washer-women.' The appointment was however pressed and accepted, and the princess appears to have made a very active and respectable president. She herself proposed to Catharine the establishment of a Russian Academy, in imitation of the French Academy, to promote the cultivation of the Russian language, of which the empress was so ardent an admirer that she once declared that, "combining as it did the richness and energy of German with the sweetness of Italian, it must one day become the leading language of the world." The Russian Academy was founded; the princess, who became the first president, set the compilation of a dictionary on foot, assigned the different letters to different persons, and herself took three, with the general superintendence of the whole. The work was completed in twelve years, it has since gone to a second edition, and it occupies a highly respectable place among the standard dictionaries. It is remarkable that the princess proposed the arrangement of the words under the alphabetical order of their roots, instead of the directly alphabetical order of both roots and compounds, which is the ordinary method of dictionaries; and that the method proposed by her is that adopted in Reiff's excellent dictionary of Russian, which is highly valued by philologists on that as well as other accounts. The empress, who, as is well known, traced the plan of the 'Comparative Dictionary of all Languages,' which was executed by Professor Pallas, was less successful as a lexicographer. The princess did not confine herself merely to the presidency of academies; she wrote some plays, contributed articles to periodicals, and set on foot and edited a monthly magazine, the 'Sobesedyk Lyubiteley Rossiyskago Slova.' For some time the two literary ladies went on in harmony, till a quarrel arose on the subject of a tragedy by Kniazhinin, the Russian poet, which the princess had allowed to be printed in one of the publications of the Academy, but which the empress asserted contained revolutionary principles, and which, when the princess defended it, she declared should be "burnt by the hands of the common executioner." This quarrel was made up, or appeared to be so; but not long after the princess resigned her office, and retired to her estates at Serpukh, in the neighbourhood of Moscow. At the death of Catharine in 1796 she received an intimation from the Emperor Paul that she was dismissed from her office, and ordered to "retire to her Novgorod estates, and reflect on the events of 1762." As the village which was assigned her for a residence in her exile was only a collection of cabins, she suffered considerable hardship till her friends procured her pardon and permission to return to Serpukh, where she resided till her death on the 4th of January 1810.

The fullest and best account of the life of the Princess Dashkov is from her own pen in the 'Memoirs of the Princess Dashkaw, Lady of Honour to Catharine II., edited from the Originals by Mrs. W. Bradford,' 2 vols. 8vo, London, 1840. The memoirs had been written by the princess at the request of Mrs. Bradford, then Miss Wilmot, an English lady, who with her sister spent some years at the princess's country-seat in the early part of the present century. They leave an impression that the princess, however eccentric and abrupt, was both clever and amiable. The memoirs appear to have been originally written in French, though this is not distinctly stated by the editress; and some letters in English by the princess, which are printed in connection, will even show that she had an excellent knowledge of our language. The volumes, though full of curious matter, seem to have attracted little attention here, and to have been till lately unknown in Russia, though some years ago a rumour was current there that such memoirs existed.

DAUBENTON, LOUIS JEAN MARIE, a celebrated naturalist and zoologist, was born at Montbard in Burgundy, on the 29th of May 1716. The church was his destination, and he was sent to Paris to study theology; but he gave in secret those hours to medicine and anatomy which his father hoped he was devoting to ecclesiastical reading. The death of his father in 1736 left him at liberty to follow the path he loved: and, having taken his degrees at Rheims, he returned to Montbard, for the purpose of exercising his profession. There he found a kindred spirit who, happily for zoology, had been connected from infancy with Daubenton. The Comte de Buffon, born at the same place, knew him well in youth, and when, in after life, Buffon was appointed intendant of the Jardin du Roi, his thoughts reverted to Daubenton as the person of all others qualified by his zeal and ability to prosecute those anatomical inquiries, the details of which his own feebleness of sight prevented him from investigating. The count drew Daubenton to Paris in 1742, and in 1745 the office of Curator and Demonstrator of the Cabinet of Natural History was conferred upon a man eminently fitted by his quick discernment, his untiring diligence, and his inexhaustible patience, to fill the situation with the greatest possible advantage to the public. No one can open the 'Histoire Naturelle des Animaux' without being struck by the multitude and justness of the facts (for he carefully avoided all theory) with which Daubenton enriched that work, and in some degree corrected the fervid imagination of his brilliant coadjutor. But he did this without presuming in the least to draw general inferences; he confined himself strictly to facts; and such was his modesty, that Camper used to say of him that he himself was not

aware of the discoveries which he had made. His valuable labours adorned the first fifteen volumes of Buffon's great work in 4to; and the editions in which this essential part of the publication is wanting, are justly considered as deprived of their fairest proportions. But Buffon in an evil hour listened to the suggestions of flatterers, and published an edition in 12mo, of which Daubenton's labours formed no part. The hint was more than sufficient for the modest Daubenton, and from that time the assistance of Guéneau de Montbeillard and of Bexon in the ornithological department but ill supplied the exquisite dissections and demonstrations which had rendered the former part of the work so highly valuable to the physiologist.

Daubenton now gave himself up more than ever to the duties of his office in the Jardin du Roi. For fifty years, indeed, did Daubenton labour without cessation in enriching and arranging the magnificent collection committed to his charge. He is said to have been the first professor of natural history who gave lectures by public authority in France, one of the chairs of the College of Medicine having been converted into a chair of natural history at his request; it was conferred on him in 1778. The Convention having elevated the Jardin du Roi into a public school, under the title of the Museum of Natural History, he was named Professor of Mineralogy, and retained the professorship as long as he lived. In 1783 he became Professor of Rural Economy at Alfort, and gave lessons in natural history at the normal school in 1795. To him France in a great measure owes the introduction and successful propagation of the breed of Spanish sheep. In 1799 he was elected a member of the senate, and the alteration in his habits caused by this new dignity is supposed to have hastened his death, which took place after an apoplectic attack of four days' duration in the night of the 31st December and 1st January 1799 and 1800, when he was nearly eighty-four years of age.

Daubenton's life, with the exception of the cloud that came between him and Buffon, raised by the weakness of the latter, was a happy one. His hours were spent in pursuits that were dear to him; he was universally respected and beloved, for he was as amiable as he was learned; and his simple habits gave him, notwithstanding his natural weakness of constitution, a long life. Daubenton was married to the authoress of '*Zélie dans le Desert*,' and though his union was in other respects most happy, he left no children.

Notwithstanding his incessant occupation at the Museum, he found time to publish much in addition to his writings in the '*Histoire Naturelle*.' He was a contributor to the first *Encyclopédie*, and many of his papers on the natural history of animals and on minerals are to be found in the '*Mémoires de l'Académie des Sciences*,' from 1754 to 1764. Two of his most interesting papers (though all are good) are those of 1762, on fossil bones pretended to be those of a giant, but which Daubenton referred to their true species; and of 1764, on the essential differences between man and the orang-outang. His '*Instruction pour les Bergers*,' 1 vol., 8vo, Paris, 1782, his '*Tableau Méthodique des Minéraux*,' 1784, 8vo, and his '*Mémoire sur le premier drapeau de laine supérieure du crû de France*,' which also appeared in 8vo, in 1784, must not be forgotten in a recollection of his works.

(G. Cuvier, *Notice sur la Vie et les Ouvrages de Daubenton*, in the *Mémoires de l'Institut*, v. iii.; *Biog. Univ. &c.*)

* DAUBENY, CHARLES GILES BRIDLE, M.D., F.R.S., and Professor of Botany and Chemistry in the University of Oxford. He is distinguished as a chemist, geologist, and physiological botanist. Dr. Daubeny's labours have mostly been directed to the explanation of natural phenomena by the aid of the facts and principles of chemical science. One of his earliest publications was, '*An Essay on the Geology and Chemical Phenomena of Volcanoes*,' which was published at Oxford in 1824. This early direction of his attention to the chemistry of volcanic action resulted in the publication of his great work entitled '*A Description of active and extinct Volcanoes*,' a second edition of which was published in 1848. This work is remarkable for the application of chemical principles to the explanation of the phenomena of one of the most active agents in the production of geological changes upon the earth's surface. The connection between the chemistry of volcanoes and that of mineral waters is evident, and to this subject Dr. Daubeny has paid a large share of attention. He has not only analysed many mineral waters, but in his '*Report on the state of our knowledge with respect to Mineral and Thermal Waters*,' given to the British Association for 1826, has shown the importance of a knowledge of the composition of mineral waters to the explanation of many geological phenomena. In 1837, Dr. Daubeny visited the United States of America, and made a series of observations on the geology of the New World. These he has published in various papers, of which the principal are the following: 1, '*Notice of the Thermal Springs of North America*,' read before the Ashmolean Society in 1838. 2, '*Sketch of the Geology of North America*, being the substance of a Memoir read before the Ashmolean Society of Oxford.' 3, '*On the Geology and Thermal Springs of North America*,' read at the British Association for 1838.

The volcanic phenomena of Italy have naturally attracted Dr. Daubeny's attention, and he has published the following papers on this subject:—1, '*On the Eruption of Vesuvius which occurred in the month of August 1834*' ('*Philosophical Transactions*,' cxv.); 2, '*On the Volcanic Strata exposed by a Section made in the Site of*

the new Thermal Spring discovered near the town of Torre dell' Annunziata, in the Bay of Naples,' published in the '*Proceedings of the Geological Society*,' vol. ii.; 3, '*On the Site of the Ancient City of the Aurunci*, and on the Volcanic Phenomena which it exhibits, with some remarks on Craters of Elevation, on the distinction between Plutonic and Volcanic Rocks, and on the theories of Volcanic Action which are most in repute,' published in the '*Transactions of the Ashmolean Society*,' 1846. The interesting volcanic district of Auvergne in France has also been investigated by Dr. Daubeny, and he has published two papers on its geology, one, '*On the Volcanoes of Auvergne*,' and the other, '*On the Origin of the Valleys of Auvergne*.' These papers were published in the third and tenth volumes of the '*Edinburgh New Philosophical Journal*.' He has published several other papers on allied subjects in the '*Transactions*' of our scientific societies.

Dr. Daubeny has also written many papers on purely chemical subjects. In 1831 he published '*An Introduction to the Atomic Theory*,' to which was added a supplement in 1840, and a new edition appeared in 1850. Various other chemical papers by Dr. Daubeny are scattered in the '*Transactions*' of the scientific societies. Many of them have reference to the chemical phenomena of vegetable life. Amongst them may be enumerated his experiments on the influence of carbonic acid, and of colour on the growth of plants, published in the '*Transactions of the British Association*.' His '*Lectures on Agriculture*,' published in 1841, are an exposition of the chemical laws which regulate the life of plants.

Dr. Daubeny is remarkable as one of the few men who have cultivated the natural sciences amidst their almost entire neglect in the University of Oxford. To him the British Association was indebted for an invitation to hold its second meeting within the walls of that ancient seat of learning, and this Association, in having elected him as its president for this year (1856), has recognised the claim he has upon their admiration and gratitude.

* D'AUBIGNÉ, JEAN HENRI MERLE, Church historian and theologian, was born at Geneva in Switzerland in 1794, the third son of Louis Merle, a merchant of that city, who again was the grandson of Aimé Merle, who had married a Mademoiselle D'Aubigné, of a distinguished French Protestant family. The historian's name therefore is Merle; D'Aubigné being an addition of honour from the grandmother's side, assumed according to a not uncommon Swiss custom. Educated first at Geneva and then at Berlin, where he attended the lectures of Neander on Church History, D'Aubigné settled for a time as pastor of a French church in Hamburg. Thence he removed to Brussels, where he was very popular as a preacher. In 1830 he returned to Geneva, where he has resided since as Professor of Church History in a theological college founded by the 'Evangelical Society of Geneva.' Of D'Aubigné's great work, the '*History of the Reformation of the 16th Century*,' the first portion appeared in Paris in 1835; the other volumes have appeared at intervals since that time. The work achieved an immediate and immense popularity in Britain and America, chiefly on account of blending its French vivacity and picturesqueness of style with evangelical religious sentiments; and several English translations of it have appeared on both sides of the Atlantic. His subsequent works, among which may be mentioned '*The Protector (Cromwell)*,' a '*Vindication*,' 1847, and a volume entitled '*Germany, England, and Scotland: Recollections of a Swiss Minister*,' 1848, have also, for the same reason, been more popular among British and American Protestants than on the Continent. Dr. D'Aubigné is also the author of many theological and ecclesiastical tracts, which have been translated into English. His sympathies with British, and especially with Scottish Evangelical Protestantism, have led him to pay frequent visits to this country; and during his last visit (1856) he received the freedom of the city of Edinburgh.

DAUDIN, FRANÇOIS MARIE, the son of a receiver-general of finance, was born at Paris in May 1774. Nearly deprived of the use of his limbs by natural infirmity, he early devoted himself to the study of the sciences, and more particularly to natural history. His memoirs soon found their way into the '*Magasin Encyclopédique*,' and the '*Annales du Muséum d'Histoire Naturelle*,' and he contributed some articles to the '*Dictionnaire des Sciences Naturelles*.' His two principal works are his '*Traité d'Ornithologie*,' which was never finished, and his '*Histoire Naturelle des Reptiles*.' For the first much cannot be said: it is on the second that his fame will rest. Cuvier speaks of the latter as the most complete work on that class of animals which had hitherto appeared. His wife, who is represented as amiable both in mind and person, and as having actively assisted in the composition and prepared the illustrations of his works, died of consumption; and poor Daudin, whose life, as well as that of his partner, had been long embittered by the deranged state of his affairs, followed her in a few days, before he had attained thirty years of age. He died in 1804, and left no children. ('*Biogr. Universelle*,' &c.)

D'AVENANT, CHARLES, a writer on politics, political economy, and finance, was born in 1656, and was the eldest son of Sir William D'Avenant, the poet. He studied at Balliol College, Oxford, and first made himself known by a dramatic piece, entitled '*Circe, a Tragedy*,' to which Dryden wrote a prologue and Lord Rochester an epilogue, and which was brought out in 1675, but not printed till 1677. It was

of an operatic character, like most of his father's productions in the same line, and of very little merit; as indeed Dryden intimates, with slight disguise, in his prologue. D'Avenant however did not pursue poetry, but applied himself to the study of the civil law; and he was some years after this made a Doctor of Laws by the University of Cambridge. Of his public employment, the first that is recorded is his appointment in 1683 as one of the six commissioners to whom the superintendence of the Excise was delegated at this time, on that part of the revenue which had for many years been let out to farm, coming again into the hands of the crown. In 1685 he was appointed Inspector of Plays, conjointly with the Master of the Revels; and that year also he was returned to parliament as one of the members for St. Ives. He was afterwards returned for Bedwin in 1698, and again in 1700; and on the 3rd of June, 1703, he was appointed Inspector-general of Exports and Imports, being the second person who had held that office, the first having been William Culliford, originally a custom-house officer in Ireland, who was appointed in 1696, and was now raised to be a commissioner of the customs. This office D'Avenant retained till his death, 14th November 1714.

D'Avenant's publications on commerce, finance, and politics range over a period of about eighteen years. We will enumerate the more remarkable of them. 'An Essay upon Ways and Means of Supplying the War,' 1695. This tract immediately gained him considerable reputation for an acquaintance with the subject of the public finances; and for some years all his subsequent publications which he acknowledged were designated on the title-page as being by the author of the 'Essay on Ways and Means;' but he is believed to have been the author of several pieces upon which no such intimation appears. 'Discourses on the Public Revenues, and of the Trade of England,' Part I. 1698; and Part II. containing the Discourses 'which more immediately treat of the Foreign Trade of this Kingdom,' also 1698. To the first part is annexed a translation of Xenophon's 'Discourse on the Revenue of Athens,' by Walter Moyle, which is also printed in Moyle's collected works. The subjects discussed in the 'Discourses' are the use of political arithmetic, credit and the means of restoring it, the management of the king's revenues, the public debts, the general nature of foreign trade, the best way of protecting it, the plantation trade, and the trade with the East Indies. A reply was made to some things in the first part of this work, in 'Remarks upon some wrong computations and conclusions contained in a late tract entitled Discourses, &c.; in a letter to Mr. D. S.' 1698. 'A Discourse upon Grants and Resumptions,' 1700. This was written to recommend that certain late grants of crown lands, &c., should be resumed; and it was answered the following year in an elaborate treatise entitled 'Jus Regium; or, the King's right to grant forfeitures, and other revenues of the crown, fully set forth,' &c. 'Essay upon the Balance of Power; the Right of Making War, Peace, and Alliances; Universal Monarchy,' 1701. This was another attack upon the government of King William, and was answered the same year in 'Animadversions on a late factious book entitled Essays,' &c. It was also formally censured by the Upper House of Convocation for a passage in which the author had declared that he could point out several persons whom nothing had recommended to places of the highest trust, and often to rich benefices and dignities, but the open enmity which they had, almost from their cradles, professed to the divinity of Christ. 'Essays upon Peace at home and War abroad,' in two Parts, 1704. To this piece he put his name; and, being now in office, he of course supports the existing government. He still however attached himself to the Tory party; and in 1710, in a work extending to two 8vo volumes, entitled 'New Dialogues upon the Present Posture of Affairs,' by the author of the Essay on Ways and Means, he renewed an attack upon their opponents, which he is believed to have commenced many years before in an anonymous publication which appeared, in two successive parts, in 1701 and 1702, under the title of 'The True Picture of a Modern Whig.' His last performances were 'Reflections upon the Constitution and Management of the Trade to Africa' (anonymous), in three parts, fol. 1709; and two 'Reports to the Commissioners for putting in execution the Act for examining the Public Accounts of the Kingdom,' 8vo, 1712. A selection of the political and commercial works of Dr. D'Avenant was published in 1771, in 5 vols. 8vo, by Sir Charles Whitworth, M.P., afterwards Earl Whitworth.

D'Avenant's writings are generally of some value for the information contained in them, and on some points he saw rather farther than the generality of his contemporaries; but he is a heavy writer, and was evidently (notwithstanding his poetical descent) a dull man, and as such (though the common notion was different) he was by no means a person to be trusted even in the handling and statement of facts. His notions upon the principles of trade and political economy also were very imperfectly systematised, and in some respects extremely immature; upon no one question perhaps is he more than partially right. He is as much behind his contemporary Sir Dudley North, for example, in the conclusions to which he had come, as if they had been separated by a century.

(*Biographia Britannica*, 2nd edit.; Craik, *History of British Commerce*, ii. 85, &c.; McCulloch, *Literature of Political Economy*, pp. 351, 352.)

DAVENANT, WILLIAM, was born at Oxford in 1605. His father, who appears to have spelt his name Davenant, kept the Crown

Inn at Oxford, and some have gathered from Wood's words ('Athen. Oxon.') hints of a connection having existed between his mother and Shakespere, who frequented that place of entertainment. He was entered at Lincoln College, Oxford; but it does not appear that he took a degree. He then became page to the Duke of Richmond, and was afterwards in the family of Lord Brooke, the poet. In 1637 he succeeded Ben Jonson as laureat; and in 1641 was accused by the parliament, and forced to retire to France. Two years after, he was knighted by Charles at the siege of Gloucester; but in 1646 we find him again in France, a Roman Catholic, and in the employ of Henrietta. Being taken prisoner at sea in 1651, he only escaped being tried for his life by the intercession of some friends, among whom are said to have been Milton and Whitelocke. His works consist of dramas, masques, addresses, and an unfinished epic called 'Gondibert,' which he dedicated to Hobbes. The only work for which he is now remembered is an alteration of the 'Tempest,' in which he was engaged with Dryden; "and marvellous indeed is it that two men of such great and indubitable genius should have combined to debase and vulgarise and pollute such a poem; but, to the scandal of the English stage, it is their 'Tempest,' and not Shakespere's, which is to this day represented." (Southey.) It is in fact only within the last two or three years that any managers have ventured to return to the text of Shakespere. D'Avenant appears to have been the first to mix the English drama with the French heroic play, and to introduce the examples of moral virtue "writ in verse, and performed in recitative music." (Dryden.) As he established a theatre as early as 1657, the times might be partly in fault, but his long residence in France had probably influenced his taste. He died in 1668, and was buried in Westminster Abbey. (Wood, *Athen. Oxon.*; *Biogr. Brit.*; Southey, *British Poets*.)

DAVID, King of Israel, was the youngest son of Jesse, a man of considerable wealth, of the tribe of Judah, dwelling at Bethlehem. David when only a youth was selected from among his father's sons for the throne of Israel by Samuel, and anointed by him. But Saul was then living, and in apparent prosperity, and this consecration of David does not appear to have been made public; for shortly afterwards he was sent for to attend upon Saul in his malady, and by his skill in music to charm "the evil spirit" which possessed him. He became for a time the favourite of Saul, who made him his armour-bearer. When a war commenced between Saul and the Philistines, the three eldest sons of Jesse joined Saul's army, but David returned to keep his father's sheep. Goliath however having challenged a champion of the Israelitish army to settle the contest by single combat, no one was found until David offered himself, and with his sling conquered the Philistine. From this time Jonathan, the son of Saul, conceived a tender friendship, "passing the love of women," for David; and Saul at first was grateful for the service rendered, placing him over the men of war, and employing him in his armies. Shortly however David became too popular with the people; Saul's envy was excited, and he sought to kill him. He failed, and to conciliate him made him captain over a thousand, to remove him from his presence, and gave him Michal, his daughter, for a wife. Saul's hatred however continued, and he proposed to his son Jonathan and others to murder David; but Jonathan disclosed the plot, David hid himself for a while, and Jonathan succeeded in reconciling his father towards his friend. Some further successes against the Philistines embittered Saul against him; he again endeavoured to kill him, and again failed. He then sent emissaries to put him to death, but Michal, David's wife, effected his escape by letting him down from a window in a basket. David fled to Samuel, and after a time withdrew to Adullam, where he assembled a force, and a sort of civil war commenced, David apparently acting only on the defensive, but at the same time employing his small army in defending his country from the Philistines. Saul pertinaciously pursued him, but at Engedi, while sleeping, David spared his life when it was in his power. Saul was moved by this magnanimity, acknowledged that David was destined to succeed him, and made a treaty with him, David swearing he would not destroy Saul's house; and Saul retired from the pursuit, but David continued to harbour in the rocky fastnesses around Engedi. Here David was straitened for provisions, and applying to Nabal, a rich man, for relief, was churlishly refused; but Abigail, Nabal's wife, afforded the necessary assistance; and Nabal dying suddenly, David took Abigail to wife, Saul having in the interval taken Michal and married her to another man.

Saul was again incited to attack David, and marched with an army to the wilderness of Ziph, where David then was. Again David refused to take the life of "the Lord's anointed" when in his power, and Saul again became reconciled. David now removed to Gath, but continued to make war on the Amalekites, the enemies of his country. Saul and Jonathan both fell in a battle with the Philistines, the former by his own hand; and David, proceeding to Hebron, was recognised King of Judah; but the Israelites under Abner made Ishbosheth king over them. A civil war commenced, which lasted a considerable time, until Ishbosheth was treacherously murdered by his own servants, when David, being then thirty years old, became king over all Israel, and reigned from B.C. 1048 to 1015. His first undertaking was against the Jebusites, whom he conquered, taking Mount Zion, which he made the capital of his kingdom and the residence of the ark. He then successively attacked and conquered

the Philistines, the Amalekites, the Edomites, the Moabites, the Ammonites, and Hadadesez, the king of Zobah, defeating the Syrians of Damascus with great slaughter who came to Hadadesez's assistance. His kingdom then extended from the Euphrates westward to the Mediterranean, and from Phœnicia southward to the Arabian Gulf. He cultivated commerce, particularly through Tyre, and encouraged the arts, especially that of building. His course for a considerable time was a prosperous one; but the rebellions of his sons Absalom and Adonijah embittered his later years. He died after a reign of forty years, seven over Judah and thirty-three over the united kingdom, appointing Solomon as his successor.

Independent of his character as a warrior, a statesman, and a king, David holds a yet higher rank as a poet—the author of many of the Psalms. By whom the book as it now stands was compiled is somewhat uncertain. The most probable opinion is, that David himself formed a collection, for the sacred service of the priests, of the psalms which he had himself composed, with others that were existing before him or had been written by his contemporaries, and that Ezra added others which had been written subsequently. A large proportion were certainly by David, and are distinguished by his name; but it is doubtful whether the titles prefixed to most of the psalms are not later additions. They are however certainly of great antiquity, possibly earlier than the time of Ezra, and it is most probable that those under David's name are correctly ascribed to him.

* DAVID, FELICIEN, an eminent French musical composer, was born at Cadenet, in Vaucluse, on the 8th of March 1810. From his father, who was a skilful amateur, young David received his first instructions in music, and when little more than seven years old entered the choir of Saint Sauveur at Aix, to which city his parents had removed. Here he soon attracted notice, as much by the intelligence with which he rendered the works of the great masters as by the beauty of his voice; and in his fifteenth year, according to the custom when the young choristers had obtained the approbation of their superiors, he was placed, for the completion of his general education, in the establishment of the Jesuits at Aix. He here successfully prosecuted his musical studies, becoming especially skilful as a player on the violin. He left this establishment at the age of eighteen; soon after accepted an engagement in the orchestra of the theatre at Aix; and in 1829 that of musical director at Saint-Sauveur. But he was now burning with anxiety to go to Paris, in order to study his art under the eminent professors assembled there, and having obtained of an uncle the promise of a small monthly allowance he proceeded to the capital. One of his compositions for the service at Saint-Sauveur, a 'Beatus vir,' which he carried to Cherubini, then director of the Conservatoire, procured for him immediate admission to that fine institution. Here he studied harmony under M. Lesueur, counterpoint and fugue under M. Fétis, and finally the organ under M. Benoît; but so anxious was he to advance as rapidly as possible, that out of his very limited income he contrived to save nearly half in order to obtain private lessons from M. Reber. His progress in the art was remarkably rapid, and several sacred pieces which he composed showed that he was obtaining a thorough mastery over the scientific principles of music. But his studies were suddenly interrupted by the failure of the promised allowance, and he was obliged to betake himself to giving lessons on the piano for a subsistence. And soon another source of interruption occurred. The doctrines of St. Simon were attracting general attention in France, and many young men of ardent dispositions eagerly adopted them. M. David became a convert, and at the end of 1831 removed his name from the Conservatoire to enter it among the confraternity at their retreat in Menilmontant; and they assigned to him the task of setting to music the hymns which they used there. When the association was broken up, M. David united himself with those members of it who made a pilgrimage to the East. There, in Egypt, in the Holy Land, and in the Desert, M. David spent some three years, his mind acquiring a certain orientalism of tone, but his religious aspirations becoming decidedly weaned from St. Simonianism. He returned to Paris in the summer of 1835, and set about preparing for publication some 'Melodies Orientales,' which he had written during his travels. But the work was coldly received, and M. David retired disconcerted to the house of a friend in the country.

David did not appear again before the Parisian public until 1838, when he prepared a symphony for the concert of Valentino, which met with but equivocal success. His 'Nonetto' for wind instruments, played in the following year at Musard's concert, was somewhat better received. He also published some melodies, which served to keep his name before the public. He had however been during his retirement labouring at a work of far higher pretensions—his 'Ode-Symphonie, en trois parties'—the 'Desert,' which was first played at the Conservatoire in December 1844, and subsequently brought out with great splendour at the Théâtre-Italien, where it met with a brilliant success: it was however somewhat less successful when played at her Majesty's Theatre, London, though it had a considerable vogue. The 'Desert' was followed by 'Moïse au Mont Sinai,' styled by the composer an oratorio in two parts. The 'Moïse' was produced at the opera, Paris, in March 1846; but was received very coldly, and has not we believe been repeated elsewhere. David's next work was the grand symphony, in four parts, of 'Christophe Colomb,' produced at the Conservatoire

in March 1847, and which in Paris met with a success at the moment only inferior to that of the 'Desert,' but its popularity was not lasting: for this work Louis Philippe bestowed on M. David the cross of the Legion of Honour. In 1848 'Eden, a Mystery, in two parts,' was performed at the opera; but the times were little suited to the production of musical mysteries, and it passed away unheeded. David's next work for the theatre was an opera in three acts, 'La Perle du Brésil,' played in November 1851 at the Opera-Nationale. Another grand opera, or musical mystery, 'La Fin du Monde,' in four acts, has been for some time announced as ready for performance. Besides his greater works, M. David has produced some smaller pieces, as 'L'Ange Rebelle,' 'Les Hirondelles,' &c.; also a series of thirty glees for four male voices, called 'La Rucho Harmonieuse'; a 'Hymn à la Paix,' &c.

(D. Denne-Baron, art. *Fel. David* in *Nouv. Biog. Gen.*; Sylvain Saint-Étienne, *Biog. de Felicien David*.)

DAVID, JACQUES LOUIS, was born at Paris in 1750. In 1774 he went to Rome to study; he returned to France ten years afterwards, and attained considerable reputation as an historical and portrait painter. Upon the breaking out of the Revolution he threw himself amongst the foremost ranks of the revolutionists. He was the intimate friend of Robespierre, and was appointed manager of all the spectacles and allegorical shows of the republic. He proposed to construct a colossal figure of the people out of the ruins of the statues of the kings, to be placed on the Pont-Neuf, but never proceeded farther than a model, from which however the design for the reverse of the republican coin was taken, which was used several years. When Robespierre, anticipating his downfall, expressed himself ready to die the death of Socrates, David, who was present, exclaimed, "Robespierre, if you will drink the hemlock I will drink it also." In 1794 he was denounced, and imprisoned, altogether about a year; but was ultimately liberated, and appears thenceforward to have taken a less prominent part in political matters. He was appointed principal painter to the National Institute. In 1815 he was banished from France with those who had voted for the death of Louis XVI., and took up his abode at Brussels, where he died December 29, 1825. Many anecdotes of his cruelty during the revolution are related by his enemies, but they are not well authenticated; others, in proof of his patriotic magnanimity, are scarcely better established. He appears in truth to have been a man of narrow capacity, and of a warm but not malicious disposition. He is described as being afflicted with a tumour in his jaw, which disfigured his appearance and so disturbed his utterance that he could not speak ten words in the same tone. To this imperfect speech he added a blustering manner.

David is said to have expressed a wish, that if an Athenian were to revisit the earth, he might take him for a Greek painter. This is the key to his style, which is a servile imitation of the Greek sculptures; his figures are like statues coloured and put in motion; his drawing is correct, and his composition classical; but his design is constrained and artificial, with a hard outline and harsh colour. The 'Rape of the Sabines' is considered one of the best of his works, which are chiefly at Paris. His portrait of Napoleon I. is well known.

DAVILA, HENRICO CATERINO, born at Pieve di Sacco, near Padua, was the son of Antonio Davila, who was great constable of Cyprus when that island was taken by the Turks from the Venetians in 1571. Antonio emigrated to Spain, where he had relations and afterwards to France, where he won the favour of Catherine de' Medici and of her son King Henri III. Lastly he went to reside in the Venetian states, where a son was born to him in 1576, to whom he gave the names of Henrico Caterino, in homage of his royal French patrons. When Henrico was seven years old his father took him to France for his education. At the age of eighteen he entered the army of Henri IV., in which he served four years, and was severely wounded at the siege of Houfleur. In 1599 he was recalled to Pieve di Sacco by his father, who soon after, in a fit of temporary insanity, put an end to his life by throwing himself out of a window. Davila now began to pay much attention to literature and to associate with literary men. Being at Parma in 1606, he attended the meetings of the academy of the "Innominati," where his hasty temper involved him in a dispute with Stigliani, one of the members, which led to a duel, in which both parties were wounded; and Stigliani, being dangerously hurt, was obliged to quit Parma, and proceed to Venice. Not long afterwards Henrico entered the military service of Venice, and was employed successively in Candia, Friuli, Dalmatia, and other stations. In 1631 he was sent to take the command of the garrison of Crema, with orders from the senate to the postmasters on the road to supply him with every conveyance required for the service. On arriving at the stage of S. Michele, near Verona, the postmaster refused to furnish the necessary accommodations. High words ensued, and the postmaster fired a pistol, and shot Davila dead in sight of his wife and children. One of Davila's sons attacked the murderer, and killed him on the spot; others were wounded in the affray, and the chaplain of Davila was also slain. The parties who assisted the postmaster were arrested, sent to Verona, and sentenced to death.

Davila is known to the world through his History of the Civil Wars in France, 'Storia delle Guerre Civili di Francia,' from the death of Henri II. to the peace of Vervins in 1598, a period of forty years most eventful in the history of that country. He treats therefore

upon the same ground as De Thou in his 'Historia sui Temporis.' Some critics have noticed that Davila evinces a partiality for the French court, and especially for Catharine de Medici, who had been his father's benefactress. The facts however stated by Davila are acknowledged to be true, and he was well acquainted with them through his own and his father's connection with France. He was familiar with the politics of his age, and with the leading contemporary characters. He was also well acquainted with the topography of the places in which most of the events which he narrates occurred. His style is graphic and animated, especially when he describes a popular insurrection, a combat, or the storming of a town. His account of the massacre of St. Bartholomew may be quoted as a specimen. Apostolo Zeno, comparing Davila with Guicciardini, observes, that whilst the prolixity of Guicciardini in dwelling minutely upon minor matters becomes wearisome to the reader, the course of Davila's narrative runs on uninterrupted, adverting briefly to circumstances of subordinate importance, and dwelling chiefly upon those which have materially affected the interests either of religion or the state. By common consent Davila is numbered among the best historical writers of Italy. His work has gone through many editions, and has been translated into several languages. Apostolo Zeno published a splendid edition of it in 2 vols. fol., Venice, 1733, to which he has prefixed a life of the author.

(Tiraboschi, *Storia della Letteratura Italiana*; Corniani, *I Secoli della Letteratura Italiana*.)

DAVIS, JOHN, a celebrated navigator of the 16th century, was born at Sandridge, near Dartmouth, in Devonshire, and distinguished himself by three voyages for the discovery of a North-West Passage, which he undertook between 1585 and 1587. He discovered the strait which bears his name, and sailed along the coast of Greenland as far as 72° N. lat., but was not able to approach the opposite coast, on account of the numerous icebergs which lined it north of the Polar Circle. He afterwards made five voyages to the East Indies, and was killed in the last (1605) in the Strait of Malacca, by some Japanese, as it is reported. He published an account of his second voyage to the north-west, and of one to the East Indies. He also wrote 'The World's Hydrographical Description; wherein is proved that the World, in all its Zones, Climates, and Places, is Habitable and Inhabited, and the Seas likewise universally Navigable; whereby it appears that there is a short and speedy passage into the South Seas to China, &c., by Northerly Navigation, to the renown, honour, and benefit of her Majesty's Commonweal,' 8vo, Lond., 1595; and 'The Seaman's Secrets, divided into two parts; wherein is taught the three kinds of Sailing, Horizontal, Paradoxal, and Sailing upon a Great Circle,' 8vo, Lond., 1595.

*DAVIS, SIR JOHN FRANCIS, BART., was born in London in 1795. His father was a director of the East India Company; and when Lord Amherst was sent ambassador to China in 1816 Mr. Davis accompanied him. He subsequently succeeded Lord Napier as chief superintendent at Canton. On his return to England, after a residence in China of more than twenty years, he published, in 1836, 'The Chinese: a General Description of China and its Inhabitants,' in 2 vols. This is undoubtedly the most valuable systematic work on China that had been produced in this country. In 1841 he also published 'Sketches in China,' with notices and observations on the war between that country and Great Britain then proceeding. In 1841 Mr. Davis was appointed Governor and Commander-in-Chief of the colony of Hong-Kong, which office he held until 1847. He was created a baronet in 1845, and received the civil order of Knight Grand Cross of the Bath in 1854. Sir Francis Davis resides in Gloucestershire, of which county he is a deputy-lieutenant.

DAVOUST (and not DAVOUST as it is usually written), LOUIS NICHOLAS, was born at Annoux in the department of the Yonne (part of the former Burgundy) in the year 1770. His family was noble, and he was sent to the military academy at Brienne, where he was a fellow-student with Bonaparte. In 1785 he was appointed sub-lieutenant in the Royal Champagne cavalry regiment, and in 1790 colonel of a regiment of Yonne volunteers. He had already taken the revolutionary side, and under Dumouriez at the battle of Jemappe, on the 8th of November 1792, he distinguished himself by his activity and boldness. After the check which Dumouriez received at Neerwinden in the following March, he began to enter into negotiations with the Prince of Coburg for the surrender of his army; this was suspected, and Davoust formed a project for seizing him in the midst of the army, which had nearly succeeded. In June 1793 he was nominated a general, but in consequence of the decree incapacitating the nobility from active service, he was forced to resign. The downfall and death of Robespierre on the 9th Thermidor (July 27) 1794, removed the impediment and restored Davoust to his rank in the army. He distinguished himself in the army of the Moselle at the siege of Luxembourg, and afterwards in the army of the Rhine under Pichegru; but when Pichegru was defeated at Heidelberg in 1795, he evacuated Mannheim, and Davoust was there taken prisoner; he however soon recovered his liberty by being exchanged. In 1797 his prudent generalship in the passage of the Rhine, as well as his personal valour, was greatly admired, and in the campaign in Italy his zeal and activity procured him the friendship and support of Bonaparte, under whom he then served. He accompanied that general

to Egypt, where his bravery was displayed in attacking and taking the village of Aboukir after the action at that place had been fought against the Turks. After the convention of El-Arish, he embarked at Alexandria to return to France. The vessel was captured by an English frigate, and he was carried as a prisoner of war to Leghorn; but an order was sent for his release within a month. On his return Bonaparte created him general of division and commander-in-chief of the cavalry in the army of Italy, in which capacity he contributed to the victory of Marengo. When Napoleon was declared emperor, Davoust was promoted to be a marshal of France, and received the grand cross of the Legion of Honour with the colonelcy of the Imperial Grenadier Guards. He justified these favours by his conduct in the campaign of 1805, especially at the battle of Austerlitz, where he commanded the right wing of the army. After the treaty of Presburg, by which Austria surrendered large portions of her territory, Davoust remained with his division in Germany; Prussia demanded that the French troops should recross the Rhine, but instead of complying with this demand, Napoleon commenced an attack on Prussia, and, on October 14th, 1806, utterly routed the Prussian army at Jena, while Davoust on the same day defeated, by his masterly manoeuvres, the Duke of Brunswick at Auerstadt, though the duke's army was greatly superior in numbers. For this exploit he was created Duke of Auerstadt. On the breaking out of the new war with Austria in 1809, he was called on to take an active part. His march through the Upper Palatinate to the Danube and the taking of Ratisbon, was a perilous but a successful enterprise. He was engaged at Eckmühl, and for his services there was afterwards created Prince of Eckmühl. At Aspern only one of his four divisions could engage, but at Wagram he commanded the right wing, by whose movements the retreat of the Austrians was mainly necessitated. After the battle he was made commander in Poland. In the expedition to Russia in 1812 Davoust commanded one of the eleven corps of which the army was composed. He was at the battle of Borodino, where he was wounded and had several horses killed under him. After the disastrous retreat from Moscow he fixed his head-quarters at Hamburg, which was immediately attacked by the allies, but which he held with a tenacity and defended with an ability that rendered vain all their efforts. It was not till April 1814, after the conclusion of peace, that he consented to surrender the place, not to the allied generals, but to General Gérard, the bearer of orders from Louis XVIII. Davoust then retired to his estate at Savigny-sur-Orge. On the return of Bonaparte from Elba he became minister of war, and in three months, in concert with the emperor, had restored the French army to the same strength it had before the events of 1814, and provided it with immense quantities of military stores. After the defeat at Waterloo he received the command of the army assembled under the walls of Paris, and would have fought, had he not received the order of the provisional government to treat with the enemy, and having signed the convention of Paris he retired with the army beyond the Loire. He made his submission to the Bourbon government on July 14, 1815, and within a few days gave up the command to Marshal Macdonald. When the ordinance of July 24th was issued proscribing Generals Gilly, Grouchy, Exelmans, Clauset, &c., he wrote to Marshal Gouvion de St. Cyr, then minister of war, demanding that his name should be substituted for theirs, as they had only acted by his orders; and he opposed the proceedings against Ney with much determination. For a while he lived in retirement, but re-entered the chamber of peers in 1819. He died on June 1, 1823.

Davoust was unquestionably possessed of great military talents; he was a brave soldier and a skilful general; but his severity and firmness too often became cruelty; his rapacity was insatiable; and the extortions he exercised on those he was appointed to govern was such that even Bonaparte censured him for his conduct while in Poland, and his treatment of Hamburg will not speedily be forgotten.

DAVY, SIR HUMPHRY, was born at Penzance, in Cornwall, on the 17th of December 1778. His ancestors had long possessed a small estate at Varfell, in the parish of Ludgvan. His father was a carver in wood. At the time of his father's death Humphry was sixteen years old, but his mother lived to witness the rapid progress made by her son in the various departments of chemical science. In his early youth he appears to have had a vivid and fertile imagination, and his brother has preserved several favourable specimens of his poetic talent; otherwise he showed no great precocity of talent. Under Dr. Cardew, whose school he quitted in 1793, he appears to have made considerable progress in learning, but certainly not such as gave any indication of his future eminence. In the beginning of 1795 he was apprenticed to Mr. Borlase, a surgeon and apothecary of Penzance, where he appears to have laid down an extensive plan of study, not merely of the sciences which related to his profession, but the learned languages, mathematics, history, &c. Dr. Davy states that he is not able to give a precise account of the nature and extent of his medical studies; but in the fourth year after he had commenced them he was considered competent by Dr. Beddoes to take charge of an establishment which he had founded at Bristol under the name of the Pneumatic Institution; this was in 1798, when he was scarcely twenty years old. In the following year Dr. Beddoes published a work, entitled 'Contributions to Physical and Medical Knowledge, principally from the West of England.' Among these were contained 'Essays on Heat, Light, and the Combina-

tions of Light, with a new Theory of Respiration; on the Generation of Oxygen Gas, and the Causes of the Colours of Organic Bodies. By Humphry Davy.' Most of the peculiar views developed in these essays were speedily abandoned by the author; indeed his brother admits that many of the speculations, he might perhaps have said most, were wild and visionary; and adds, what will be readily admitted, "that the wildest of them are most natural to a young mind just entering on the twilight of physical science, gifted with high powers and a vivid imagination."

His next recorded experiments relate to the existence of silica in various plants, especially in the epidermis of cane; and in 1800 he published in 1 vol. 8vo a work entitled 'Researches, Chemical and Philosophical, chiefly concerning Nitrous Oxide and its Respiration.' In this work, which contained the details of numerous highly-interesting experiments, he has minutely detailed the extraordinary effects produced both upon himself and others by respiring nitrous oxide, a gas till then deemed irrespirable. This work also contains an account of some extremely hazardous experiments which he made upon himself in breathing carburetted hydrogen, carbonic acid gas, azote, hydrogen, and nitric oxide: in these dangerous trials his life was more than once nearly sacrificed.

In 1801 Davy came to London, and on the 25th of April he gave his first lecture at the Royal Institution. He began with the history of galvanism, detailed the successive discoveries, and described the different methods of accumulating it; and on the 31st of May 1802 he was appointed professor. From 1800 to 1807 a great variety of subjects attracted his attention, especially galvanism and electro-chemical science; the examination of astringent vegetable matter in connection with the art of tanning, and the analysis of rocks and minerals with relation to geology and to agricultural chemistry. In November 1807 his second Bakerian lecture was read, in which he announced the most important and unexpected discovery of the decomposition of the fixed alkalis by galvanism, and of the metallic nature of their bases, to which he gave the names of potassium and sodium. Dr. Paris has well observed that "Since the account given by Newton of his first discoveries in optics, it may be questioned whether so happy and successful an instance of philosophical induction has ever been afforded as that by which Davy discovered the composition of the fixed alkalis." From the year 1808 to 1814 the following papers by Davy were read before the Royal Society, and published in their 'Transactions':—'Electro-Chemical Researches on the Decomposition of the Earths; with Observations on the Metals obtained from the Alkaline Earths, and on the Amalgam procured from Ammonia,' read June 30th, 1808. 'An Account of some New Analytical Researches on the Nature of certain Bodies, particularly the Alkalis, Phosphorus, Sulphur, Carbonaceous Matter, and the Acids hitherto uncombined; with some general Observations on Chemical Theory,' December 13th, 1808. 'New Analytical Remarks on the Nature of certain Bodies; being an Appendix to the Bakerian Lecture for 1808,' February 1809. 'The Bakerian Lecture for 1809; on some New Electro-Chemical Researches on various Objects, particularly the Metallic Bodies, from the Alkalis and Earths, and on some Combinations of Hydrogen,' November 16th, 1809. 'Researches on the Oxymuriatic Acid, its Nature and Combinations, and on the Elements of Muriatic Acid; with some Experiments on Sulphur and Phosphorus,' July 12th, 1810. 'The Bakerian Lecture for 1810; on some of the Combinations of Oxymuriatic Acid Gas and Oxygen, and on the Chemical Relations of those Principles to Inflammable Bodies,' November 15th, 1810. 'On a Combination of Oxymuriatic Gas and Oxygen Gas,' February 21st, 1811. 'On some Combinations of Phosphorus and Sulphur, and on some other Subjects of Chemical Inquiry,' June 18th, 1812. 'On a New Detonating Compound,' November 5th, 1812. 'Some further Observations on a New Detonating Substance,' July 1st, 1813. 'Some Experiments and Observations on the Substances produced in different Chemical Processes on Fluor Spar,' July 8th, 1813. 'An Account of some New Experiments on the Fluoric Compounds, with some Observations on other Objects of Chemical Inquiry,' February 13th, 1814.

After the enumeration of these important subjects, we cannot do better than refer to them in the words of his brother and biographer: "I shall not," says Dr. Davy, "attempt an analysis of these papers; I shall give merely a sketch of the most important facts and discoveries which they contain, referring the chemical reader to the original for full satisfaction. After the extraction of metallic bases from the fixed alkalis, analogies of the strongest kind indicated that the alkaline earths are similarly constituted; and he succeeded in proving this in a satisfactory manner. But owing to various circumstances of peculiar properties, he was not able on his first attempts to obtain the metals of these earths in a tolerably pure and insulated state for the purpose of examination. On his return to the laboratory after his illness, this was one of his first undertakings. He accomplished it to a certain extent by uniting a process of MM. Berzelius and Pontin, who were then engaged in the same inquiry, with one of his own. By negatively electrifying the earths, slightly moistened, and mixed with red oxide of mercury, in contact with a globule of mercury, he obtained amalgams of their metallic bases; and by distillation, with peculiar precautions, he expelled the greater part of the mercury. Even now, in consequence of the very minute quantities of the bases which he procured, and their very powerful attraction for oxygen, he

was only able to ascertain a few of their properties in a hasty manner. They were of silvery lustre, solid at ordinary temperatures, fixed at a red heat, and heavier than water. At a high temperature they abstracted oxygen from the glass, and at ordinary temperatures from the atmosphere and water, the latter of which in consequence they decomposed.

"The names he proposed for them, and by which they have since been called, were barium, strontium, calcium, and magnesium, which he afterwards altered to magnesium.

"The same analogies were nearly as strong applied to the proper earths; and he attempted their decomposition in a similar manner, but not with the same success. By the action of potassium proof was obtained that they consist of bases united to oxygen; but whether these bases were inflammable substances merely, or metallic inflammable substances, was yet a problem, which has since been solved by the labours of Wöhler, Bussy, and Berzelius. Analogy was in favour of the latter inference, as was also the circumstance that the bases of these earths are capable of entering into union with iron; and this has been confirmed by the inquiries just mentioned as regards the majority of them, all but the basis of silica, which yet remains doubtful.

"The application of these facts to geology was full of promise; and he indulged in the hope that they might serve to explain not only some of the most mysterious phenomena of nature, as earthquakes and volcanoes, and the combustion of meteoric stones and falling stars, but might ultimately lead to a general hypothesis of the formation of the crust of the earth."

His ideas on this last subject, which he afterwards in great measure relinquished, may be seen in Dr. Davy's 'Life of Sir Humphry,' vol. i. p. 397.

After effecting the decomposition of the fixed alkalis, Davy, reasoning from analogy, conjectured that ammonia might also contain oxygen, and his first experiments were favourable to this supposition; but they contained a fallacy. In his various papers on 'oxymuriatic acid and its compounds,' he establishes the views of Scheele respecting its nature, and proves that the reasoning of Berthollet, which had generally been admitted by chemists, was fallacious. He shows that oxymuriatic acid is not a compound, as supposed, of muriatic acid and oxygen, but an undecomposed body, to which, on account of its green colour, he gave the name of chlorine. In 1810 he published the first volume of his 'Elements of Chemical Philosophy,' which, although they bear marks of haste, contain much interesting matter: no further portion of this work was printed. His 'Elements of Agricultural Chemistry,' which appeared soon after, is a work containing much useful matter, and replete with sound and practical views of the subject.

One of his greatest inventions was that of the miner's safety-lamp, the first paper in relation to which appeared in the 'Philosophical Transactions' for 1815, and the last in 1817.

Sir Humphry became president of the Royal Society in 1820, and he continued to contribute papers on subjects of great interest for some years. Among the most curious of these, and full of promise as to utility, were those which related to the modes of protecting the copper sheathing of ships; from causes however which even his sagacity could not foresee, the plan proved abortive.

We have thus given a very imperfect and slight sketch of the discoveries of this very extraordinary man and eminent chemist; a list of his works, or at any rate the principal of them, will be found at the end of Dr. Paris's Life of him. With respect to his philosophical character, the parallel which has been drawn between him and Dr. Wollaston by the late Dr. Henry, while it does justice to both, presents the powers of Davy in a strong and clear point of view, and in the language of one who was deeply versed in the sciences of which he is speaking, and intimately acquainted with the philosopher whose portrait he draws.

"To those high gifts of nature which are the characteristics of genius, and which constitute its very essence, both these eminent men united an unwearied industry and zeal in research, and habits of accurate reasoning, without which even the energies of genius are inadequate to the achievement of great scientific designs. With these excellences, common to both, they were nevertheless distinguished by marked intellectual peculiarities. Bold, ardent, and enthusiastic, Davy soared to greater heights; he commanded a wider horizon, and his keen vision penetrated to its utmost boundaries. His imagination, in the highest degree fertile and inventive, took a rapid and extensive range in the pursuit of conjectural analogies, which he submitted to close and patient comparison with known facts, and tried by an appeal to ingenious and conclusive experiments. He was endued with the spirit and was a master of the practice of the inductive logic; and he has left us some of the noblest examples of the efficacy of that great instrument of human reason in the discovery of truth. He applied it not only to connect classes of facts of more limited extent and importance, but to develop great and comprehensive laws, which embrace phenomena that are almost universal to the natural world. In explaining these laws he cast upon them the illumination of his own clear and vivid conception; he felt an intense admiration of the beauty, order, and harmony which are conspicuous in the perfect chemistry of nature; and he expressed those feelings with a force of

eloquence which could issue only from a mind of the highest powers and the finest sensibilities." ('Elements of Chemistry,' 11th edition.)

Davy was knighted on the 8th of April 1812, and on the 11th of the same month he married Mrs. Apreece, the widow of Shuckburgh Ashby Apreece, Esq., eldest son of Sir Thomas Apreece; this lady was the daughter and heiress of Charles Kerr, Esq., of Kelso, and possessed a very considerable fortune. He was afterwards created a baronet. He died on the 28th of May 1829, at Geneva. His widow survived him till 1855.

*DAVY, JOHN, M.D., F.R.S., the brother and biographer of Sir Humphry Davy, and eminent as a chemist, geologist, and physiologist. Dr. Davy studied medicine in Edinburgh, and took his degree of Doctor of Medicine in that University in 1814. He entered the army as a surgeon, and is now inspector-general of army hospitals on half-pay. He has been a most copious writer, having written several volumes on general subjects, besides a large number of papers ranging over nearly the whole field of natural science. His general works are—1, 'An Account of the Interior of Ceylon and of its Inhabitants, with Travels in that Island,' London, 4to, 1821. 2, 'Life of Sir Humphry Davy,' London, 2 vols. 8vo. 3, 'Notes on the Ionian Islands and Malta,' London, 2 vols. 8vo, 1842. 4, 'The West Indies before and since Slave Emancipation,' London, 1 vol. 8vo. 5, 'The Angler and his Friend,' 1 vol. 8vo.

Dr. Davy's physiological researches have been principally published in the 'Philosophical Transactions,' the 'Transactions' of the Royal Society of Edinburgh, and the Royal Medico-Chirurgical Society. He has also published two volumes entitled 'Researches Physiological and Anatomical,' London, 8vo, 1839. It is almost impossible to give in a few words an idea of the extent and variety of these researches. They embrace a wide field of observation, and afford abundant evidence of a highly cultivated mind and habits of accurate observation. The subject of animal heat has perhaps been more illustrated by Dr. Davy's researches than any other on which he has written. The title of some of his papers will show the range of his physical enquiries. 'On the Specific Gravity of different parts of the Human Body,' 'An Account of some Experiments and Observations on the Torpedo,' 'On the early Generative Power of the Goat,' 'On the Composition of the Colostrum,' 'Miscellaneous Observations on Blood and Milk.' The sciences of meteorology and geology have both received valuable contributions from the pen of Dr. Davy. In all his researches he has displayed an intimate acquaintance with the science of chemistry, and one of his most recent works consists of a series of 'Lectures on the Study of Chemistry,' in which this science is regarded in its relations to the atmosphere, the earth, the ocean, and the art of agriculture.

DAWES, RICHARD, was born at Market-Bosworth in the year 1708. His first teacher was Anthony Blackwall, the well-known author of 'The Sacred Classics,' after which he spent some time at the Charter House, and went to Emanuel College, Cambridge, in the year 1725; he was elected Fellow in 1731. In 1736 he published a specimen of a translation of 'Paradise Lost' into Greek hexameters, which proved, as he afterwards admitted (Pref. to his 'Miscellanea Critica'), that he was then very insufficiently acquainted with the Greek language. He became master of the grammar-school at Newcastle-upon-Tyne in 1738; but his disagreeable manners diminished the number of his scholars, and he resigned the situation in 1749. In his latter days his principal employment was rowing in a boat on the Tyne. He died at Haworth on the 21st of March 1766. The work on which his fame rests is his 'Miscellanea Critica,' published at Cambridge in 1745, which places him in the same class with Bentley and Porson as a verbal Greek critic. The work is divided into five sections, of which the first contains some emendations of Terentianus Maurus; the second is a specimen of the want of accuracy in the Oxford edition of Pindar; in the third are some general observations on the Greek language, to which are added some emendations of Callimachus; the fourth is a short discussion on the Digamma; and the fifth is devoted to the illustration of Aristophanes. The leading characteristic of the scholarship of Dawes is a proneness to rash generalisation; and though it has been termed the scholarship of observation, it must be admitted that Dawes is too apt to form general rules from an insufficient number of passages, and consequently that his system scarcely deserves that title. Hardly one of the syntactical rules which Dawes has laid down has been admitted as unexceptionable; and some of them have been completely overthrown by the number of passages in which they are violated. The authority of the 'Miscellanea Critica' was however so great for some twenty or thirty years after its publication, that many readings supported by manuscript authority were altered to meet the canons in that book. The violent animosity which Dawes everywhere shows towards Bentley may perhaps be accounted for by the universal dislike which that great scholar had incurred during his quarrels with Trinity College, about the time when Dawes was a young member of the university. The best editions of the 'Miscellanea Critica' (which may now be considered as superseded by the advances which Greek scholarship has made during the last thirty years) are those by Burgess, Oxon., 1781, and by Kidd, Cantabr., 1817, in which specimens of his other writings may be seen.

DAY, THOMAS, was born at London in 1748. His father held a

place in the Customhouse, and died when Thomas was a year old, leaving him a fortune of 1200*l.* a year. He received his school education at the Charterhouse, and at the age of sixteen was entered a gentleman commoner of Corpus Christi College, Oxford, where he remained for three years, but left without taking a degree. He then spent some summers in travelling through and residing in France and other parts of the continent. He had already adopted certain strong and peculiar opinions on the subject of education, holding apparently on the one hand that the common mode of education was wholly vicious, and on the other, that by a proper education there was scarcely anything that might not be accomplished. About the year 1769 he proceeded to put his theories to the test of a bold experiment, by selecting from the founding hospital at Shrewsbury two girls of twelve years of age, with the design of rearing them according to his own notions, and then making one of them his wife; and although this speculation failed in the main point, its eccentric author never having married either of his protégées, both the girls, with the portions he gave them, obtained husbands, and by the propriety of their conduct through life did honour to his training. In 1778 Mr. Day married Miss Milnes, of Yorkshire, a lady similar to himself in her tastes and opinions, and having a fortune as large as his own. The following year he was called to the bar; but he never practised. Meanwhile in 1773 he had made his first appearance as an author, in conjunction with his friend Mr. Bicknell, in a poem entitled 'The Dying Negro,' a production which is said to have had a considerable share in exciting the public feeling against the atrocities of the slave-trade. In 1776 he published another poem, called 'The Devoted Legions,' being an attack upon the American War. It was followed the next year by another on the same subject, entitled 'The Desolation of America.' After this he published several political pamphlets in prose; namely, in 1784, 'The Letters of Marius; or Reflections upon the Peace, the East India Bill, and the Present Crisis,' and 'A Fragment of a Letter on the Slavery of the Negroes' (in the United States); in 1785, 'A Dialogue between a Justice of Peace and a Farmer;' and in 1788, 'A Letter to Arthur Young, Esq., on the Bill to prevent the Exportation of Wool.' In 1783 appeared the first volume of the work by which he is now principally remembered, his 'History of Sandford and Merton'; the second volume was published in 1786, and the third in 1789. The object of this fiction is to illustrate and recommend the views of the author on education and on human nature generally; and it is a good picture of both his intellectual and his moral character. Its freshness and vigour, and the strain of disinterestedness and philanthropy that pervades it, have a charm, especially for the young; but the narrowness of the writer's views makes it useless for any practical purpose, and nearly equally valueless as a piece of philosophy. Day is also the author of a shorter work of fiction, called 'The History of Little Jack.' He was killed 28th of September 1789, by a kick from a young horse, which he was training upon some new principle.

DE CANDOLLE, AUGUSTIN PYRAMUS, was born at Geneva, where his father was premier syndic, in 1778, the year in which Haller, Linnaeus, and Bernard de Jussieu died. His family originally came from Marseille, but had for more than two centuries been settled at Geneva. His earliest tastes were altogether of a literary kind, and from infancy he was distinguished for the ardour with which he pursued his studies. He was remarkable for the facility with which he wrote verses, a habit in which he indulged throughout life. In 1792, with his mother and brother, he sought refuge, whilst the French were besieging Geneva, in a village situated at the foot of the Jura. Here he amused himself in collecting wild plants, and acquired a taste for botany, which, on subsequently attending the lectures of Professor Vaucher in his native city, became the occupation of his life. In 1796 he went to Paris, and attended the lectures of Vauquelin, Cuvier, and Fourcroy. He also became intimately acquainted with Desfontaines and Lamarck.

The first efforts of De Candolle in botanical science were rather directed to the observation of facts and the accurate distinction of species, than to the theories connected with the physiology or development of plants. His first publication was a description of succulent plants, delineations of which were supplied by Redouté. He also drew up the descriptions for the magnificent work of the same artist on the 'Liliaceae,' which was published in 1802. After a short withdrawal from Paris on account of the political state of France, he returned there in 1804, and took his degree of Doctor of Medicine. His thesis on this occasion was on the medical properties of plants. In this masterly essay, which he subsequently republished much enlarged, he demonstrated satisfactorily the close connection that exists between the sciences of botany and medicine, and it led to an increasing attention to the structure and secretions of plants, as affording at once the aliment of man in health and his medicine in disease. In the same year he delivered in the College of France a course of lectures on the principles of botanical arrangement, of which he gave a sketch in the introduction to the third edition of Lamarck's 'Flora of France,' which was published in the following year. This sketch gave an outline of those principles of classification which in after life became the basis of those great works on which his fame as a botanist must principally rest. Although nearly every botanist had yielded to the influence of the artificial system of Linnaeus, De Candolle

at this period correctly estimated its merits. "The natural method," he observed, "endeavours to place each individual object in the midst of those with which it possesses the greatest number of points of resemblance; the artificial has no other end than that of enabling us to recognise each individual plant, and to isolate it from the rest of the vegetable kingdom. The former, being truly a science, will serve as an immutable foundation for anatomy and physiology to build upon; whilst the second, being a mere empirical art, may indeed offer some conveniences for practical purposes, but does nothing towards enlarging the boundaries of science, and places before us an indefinite number of arbitrary arrangements. The former, searching merely after truth, has established its foundation on the organs that are of the greatest importance to the existence of plants, without considering whether these organs are easy or difficult of observation; the second, aiming only at facility, bases its distinctions upon those which are most readily examined, and therefore present the greatest facilities for study."

In the collection of plants De Candolle spared no personal pains, and from the time of his being associated with Lamarck to 1812, travelled over every district of the then extensive possessions of France for the purpose of examining its native plants. In these excursions also he was frequently employed by the government to report upon the state of agriculture.

In 1807 De Candolle was made Professor of Botany in the Faculty of Medicine at the university of Montpellier. In 1810, a chair of Botany being constituted in the Faculty of Sciences of the same place, he was appointed to it. During his residence at Montpellier he devoted much time to the botanic garden; and published a catalogue of the plants contained in it, with descriptions of many new species. Circumstances however occurred which led him to quit Montpellier, and in 1816 he returned to his native city, which was restored to its independence on the re-establishment of the Bourbons on the throne of France. A chair of natural history was established especially for him at Geneva. In the same year he visited England to examine the collections of plants in the British Museum, the Linnæan and other societies, for the purpose of aiding him in the publication of his great work on the vegetable kingdom.

In 1818 appeared the first volume of this work, intended to comprehend a description of all known plants. He had in a measure enunciated the principles on which this work would be based by the publication of his 'Théorie Élémentaire,' in 1813. In this work he not only carried out the principles of a natural arrangement of plants, which had been previously developed by Jussieu and Adanson, but by a more extended study of the principles of morphology he was enabled to clear up many of the difficulties which existed in the grouping of plants in previous classifications. Whatever may be the claims of previous writers in this department of botanical inquiry, to De Candolle must be conceded the merit of giving definite expressions for the various causes which act upon the structure of plants, and pointing out the relation between abnormal forms in individual plants and normal forms in particular groups.

The natural system of the vegetable kingdom however was only commenced; a second volume appeared in 1821, but the author was obliged to abandon the design, as a work of too great magnitude. He therefore in 1824 commenced the publication of a *Prodromus* of the larger work. But even this proved a work too extensive for completion during his lifetime. This work embraced descriptions of all the known species of plants. Commencing with the phanerogamous plants, each order in the natural system was exhausted as far as the materials of the author would allow. All the orders belonging to the polypetalous division of Exogens were completed, as well as the orders of the monopetalous division as far as the Compositæ. To this last difficult order De Candolle had paid much attention, and his desire to give it in as perfect a form as possible led him to devote so much time to it as materially to injure his health. The work was left incomplete at his death, but partly from the materials which he had collected it was continued by his son, assisted by other eminent botanists. The importance of this publication to the working botanist can hardly be overrated, as it supplies him with the means of recognising a vast number of species that had before been either undescribed or inaccessible to the student from the places in which they were published. Another point which enhances the value of this work is the care which the author bestowed in drawing up the descriptions of plants, which could not have been done so well by any one who possessed a less extensive herbarium and library than himself.

But although the labour bestowed on this great work, and the judgment with which it was executed, have given it the most prominent position amongst his works, it can only be regarded as the result of an accurate knowledge of the structure and function of plants. On this subject he lectured for many years, and although frequently producing monographs on various departments of botany, which indicated his knowledge of vegetable anatomy and physiology, it was not till 1827 that he published his 'Organographie Végétale.' In this work he proceeded on the principle of tracing each organ through all its several modifications of structure in the different plants in which it occurs, and of reducing every part to its organic elements. It is thus not a mere detail of particular structures, but a development of the great doctrine of metamorphosis, which had been

explained in his previous work on the principles of classification. This work was followed in 1832 by one on the physiology of plants. This was a comprehensive digest of all that had been done up to the period at which it was written. It was however published at a time when the chemist and physiologist were both turning their attention to the functions of the vegetable, as affording the means of better understanding the nature of the functions of the animal, and consequently many of the views of the author have had to give way before more extended investigation.

For several years previous to his death, De Candolle suffered from ill-health. In 1841 he was induced to visit the meeting of naturalists held at Turin, in the hope that change of climate would restore his failing powers, but he derived no benefit from his journey, and died on the 9th of the following September.

As a botanist De Candolle must be placed in the first rank in the century in which he lived. He possessed a quick apprehension, which enabled him to make use of the labours of others, added to a habit of methodical arrangement, by which he could at once refer the various facts that came to his knowledge to their proper position in the departments of the science which he pursued. It was this which, combined with a clear and pleasing delivery, made him a successful lecturer, and enabled him to produce with rapidity so many works on botany. But he was not only a botanist: he was earnest in his sympathies with mankind, and was a zealous philanthropist and energetic citizen. In Paris, in the early part of his life, under the auspices of Benjamin Delassart, he took an active part in the formation of the Société Philantropique of Paris, and the Society for the Encouragement of National Industry was formed under his direction and management. He was for many years a member of the legislative body of Geneva, and also rector of the academy in the same place.

The following is an alphabetical list of his works:—

1. 'Astragalologia, nomen Astragali, Biserrulæ, et Oxytropidis, necnon Phacæ, Colutæ, et Lassertini Historia, Iconibus illustrata a Redouté,' fol., Paris, 1802. This work was an account of the Astragalus and some allied genera, and was illustrated by Redouté.
2. 'Catalogue des Arbres Fruitières et des Vignes du Jardin Botanique de Genève,' Geneva, 1820.
3. 'Eloge Historique d'Aug. Broussonet' (the botanist), 4to, Montpellier, 1809.
4. 'Essai Élémentaire de Géographie Botanique,' 8vo, Paris, 1821: a reprint of an article in the 'Dictionnaire des Sciences Naturelles.'
5. 'Essai sur les Propriétés Médicinales des Plantes, comparées avec leurs Formes extérieures et leur Classification Naturelle,' 1804, 8vo, Paris, 1816. This was his inaugural dissertation on the medical properties of plants in 1804, which he republished in the year 1816.
6. 'Flore Française, ou Description de toutes les Plantes qui croissent naturellement en France.' The third edition of this work was edited by De Candolle. It was published at different times from 1803 to 1815, and contained a description of 6000 plants, and was accompanied by a coloured chart, indicating the distribution of plants throughout France.
7. 'Icones Plantarum Gallie rariorum,' 4to, Paris, 1804.
8. 'Instructions Pratiques sur les Collections Botaniques,' 8vo, Geneva, 1820.
9. 'Mémoire sur les différents Espèces, Races, et Variétés de Choux et de Raiforts cultivés en Europe,' 8vo, Paris, 1822. This is a translation of a memoir which appeared in the 'Transactions of the Horticultural Society of London.'
10. 'Mémoires sur la Famille des Légumineuses,' illustrated by 70 plates, 4to, Paris, 1825.
11. 'Notice sur l'Histoire et l'Administration des Jardins Botaniques,' 8vo, Paris, 1823. This was a reprint of an article which appeared in the 'Dictionnaire des Sciences Naturelles.'
12. 'Organographie Végétale,' 2 vols. 8vo, Paris, 1827.
13. 'Plantarum Succulentarum Historia,' 4 vols. 4to and fol., Paris, 1799.
14. 'Plantæ Raræ du Jardin de Genève,' 4to, Geneva, 1825. It was published in parts, each part containing six plates.
15. 'Prodromus Systematis Naturalis Regni Vegetabilis,' 8vo, Paris and London, 1824, &c.
16. 'Regni Vegetabilis Systema Naturale,' 8vo, Paris, 1818. This work, which was to have contained a full description of all the plants then known, was only commenced by De Candolle, and the 'Prodromus' was published in its place.
17. 'Projet d'une Flore Géographique du Léman,' 8vo, Geneva, 1820.
18. 'Rapport à la Société de Lecture de Genève,' 8vo, Geneva, 1820.
19. 'Rapport sur la Fondation du Jardin de Botanique de Genève,' 8vo, 1819. A second report on the same subject was published in 1821.
20. 'Rapport sur la Question des Magasins de Subsistance, fait au Conseil Représentant de Genève,' 8vo, Geneva, 1819.
21. 'Rapport sur la Pomme de Terre, fait à la Classe d'Agriculture de Genève,' 8vo, Geneva, 1822. This was followed by two other reports on the culture and uses of the potato.
22. 'Théorie Élémentaire de la Botanique,' 8vo, Paris, 1813 and 1816.

Besides the above works, De Candolle contributed papers to the 'Transactions' of almost every scientific society in Europe, a bare list of which would far exceed the limits of this article.

(Dr. Daubeny, *Sketch of the Writings and Philosophical Character of A. P. De Candolle*; *Proceedings of the Linnean Society*, 1842; Bischoff, *Lehrbuch der Botanik*; Quézard, *La France Littéraire*.)

DECHALES, CLAUDE FRANÇOIS MILLIET, was born at Chambéry, the capital of Savoy, in 1611. He wrote largely on several branches of mathematical, mechanical, and astronomical science; but the only work by which he is generally known is his edition of Euclid, which was long a favourite text-book in France and in other parts of the continent. It was also translated into English,

but did not obtain great popularity among our countrymen, whose taste in geometry continued, till recently, to partake strongly of the pure severity of the ancient Greek writers.

Dechâles was however an accurate and elegant writer on the subjects which he treated; and there are interspersed through his works many marks of considerable invention, as well as of a happy power of adaptation of the knowledge of his predecessors and contemporaries. Still he was not one of those men who had the power greatly to extend the boundaries of science; it was his province rather to place it in such a light as to facilitate its acquisition by others.

He was appointed professor of mathematics in the college of Clermont, the chair of which he appears to have filled for about four years; and thence he removed to Marseille, where he taught navigation, military engineering, and the applications of mathematics to practical science. From Marseille he went to Turin, where he was appointed professor of mathematics in the university, and died in that city in 1678, being sixty-seven years of age.

As a teacher, Dechâles was remarkable for his urbanity, and for the adaptation of his instruction to the previous acquirements of his pupils; and as a man, his probity and amiable spirit gained for him the admiration and love of all with whom he was associated.

The works of Dechâles were published at Lyon in 1690, in four folio volumes, under the title of *Mundus Mathematicus*. A former edition of these was also published in three volumes; but this edition is far less complete than that of 1690.

DECIUS CAIUS MESSIUS QUINTUS TRAJANUS, the Roman emperor, succeeded Philip, and chiefly distinguished himself for his violent persecution of the Christians. He and his son fell in an expedition against the Goths, about A.D. 251.

Coin of Decius Trajanus.

British Museum. Actual size. Copper. Weight 303½ grain.

DECIUS MUS, a Roman who distinguished himself by many warlike exploits, and received many honours. In a battle against the Latins he voluntarily devoted himself to the *Dii Manes*. He had made an agreement with his colleague, Manlius Torquatus, that the consul whose wing first gave way should devote himself to death. The ceremony of consecration was performed with great solemnity, and having directed the lictors to acquaint the other consul that he had given himself up for the safety of the army, he rode into the thick of the enemy, and was soon overpowered by a shower of darts, about B.C. 338. His son Decius Mus followed his heroic example in a war against the Gauls, a.d. 295, as well as his grandson in the war with Pyrrhus, a.d. 280.

DECKER, JEREMIAS DE, one of the most esteemed Dutch poets of the 17th century, was born at Dordrecht about 1610. His father Abraham de Decker, who had embraced the reformed religion, was, although of good family, in very moderate circumstances, first as a tradesman, afterwards as a public broker. Aided merely by such instruction as his father could give him, and his own natural aptitude for learning, which was seconded by an excellent memory, young De Decker made so great proficiency that while yet a lad he acquired the Latin, Italian, French, and English languages, notwithstanding he was even then obliged to assist his father in his business. At no time of his life in fact can literature be said to have been his occupation, yet that and poetical composition continued to the last to employ the intervals of leisure allowed by his commercial pursuits.

His earliest essays in poetry consisted of paraphrases from Jeremiah, &c., and of translations and imitations from Horace, Prudentius, Buchanan, to which may be added his 'Good Friday,' a collection of pieces breathing the most pure devotional feeling. Indeed a strong vein of unaffected religious sentiment runs through all his compositions. Even his 'Puntliedten' are many of them of a religious, all of a moral tendency, being for the most part so many condensed ethic lessons and reflections rather than epigrams, except as to the ingenious turn and point, which frequently render them highly impressive, although their subjects may be familiar truths. The longest of all his productions is his 'Lof der Geldzucht,' or 'Praise of Avarice,' a poem in which that vice is satirised in a strain of amusing irony. It is replete with learning, felicity of illustration, and a playfulness of tone which only serves to render it all the more caustic; no wonder therefore that it has been greatly admired, and has earned for itself a place beside Erasmus's celebrated 'Moris Encomium.' This was almost the very last piece he ever wrote, nor did he live to enjoy its reputation, for he died while it was in the press, in November 1666.

DECKER, SIR MATTHEW, BART., was born at Amsterdam in the latter part of the 17th century, of a Protestant family originally from Flanders, where his ancestors had been engaged in commerce till they were driven out in the Spanish persecution under the Duke of Alva, leaving their estates to their Catholic relations, some of whom long continued to occupy eminent positions in the municipal government at Brussels. Such was the account given by Sir Matthew himself to Collins, the genealogist, in 1727, as recorded by the latter in his 'English Baronetage,' iv. 185 (published in 1741). Decker came over to England in 1702; and he was naturalised the following year by the 28th private Act of the 2nd of Anne. Having settled as a merchant in London, he rose to great commercial eminence, was made a baronet in 1716, and in 1719 was returned to Parliament for Bishop's Castle. He only sat however in the House of Commons for four sessions, and his name does not occur in the reported debates. He married Henrietta, daughter of the Rev. Dr. Richard Watkins, rector of Wickford, in Warwickshire; and he died March 18th, 1749, when the baronetcy became extinct, and his estates devolved upon his three daughters. It is said to have been in the gardens of Sir Matthew Decker's country-seat at Richmond, in Surrey, that the pine-apple was first brought to maturity in England.

Decker is believed to be the author of a little work first published in 8vo at London, in 1743, and entitled in the fourth edition, which appeared in the course of the following year, 'Serious Considerations on the several high duties which the nation in general (as well as its trade in particular) labours under; with a proposal for preventing the running of goods; discharging the trade from any search, and raising all the public supplies by one single tax. By a well-wisher to the good people of Great Britain.' In the seventh edition, which appeared in the same form in 1756, the tract is stated on the title-page to be 'By the late Sir Matthew Decker, Bart.' It consists in both these editions of only 32 pages. The author explains his object in p. 15: "My proposal," he says, "in short, is this: that there be but one single excise duty over all Great Britain, and that upon houses." He would in this way raise an annual revenue of 6,000,000*l.*, being as much as the ordinary expenses of the government then amounted to; with 1,000,000*l.* over to form a sinking-fund for the discharge of the debt. He calculates that in England, exclusive of Wales, there were then 1,200,000 houses; but of these he would tax only 600,000, counting off 500,000 as inhabited by the working and poorer classes, and 100,000 as uninhabited.

We do not know whether this scheme attracted much notice when it was first proposed, but, from the frequency with which it was reprinted, we may infer that it did. It was at any rate elaborately answered, soon after its republication in 1756, in a thick pamphlet of 120 pp., entitled 'The proposal commonly called Sir Matthew Decker's scheme, for one general tax upon houses, laid open, and showed to be a deep concerted project to traduce the wisdom of the Legislature, disquiet the minds of the people, and ruin the trade and manufactures [sic] of Great Britain; most humbly submitted to the consideration of Parliament,' 8vo, London, 1757. The author of this attack is understood to be Mr. Joseph Massie, a fertile mercantile writer of that day. It is, as might be expected from the title, very angry, and even somewhat abusive.

Decker has also been commonly supposed to be the author of another more considerable work, first published in 4to at London, in 1744, and reprinted in 12mo at Edinburgh, in 1756, both editions without a name, under the title of 'An Essay on the Causes of the Decline of the Foreign Trade, consequently of the Value of the Lands of Britain, and on the means to restore both.' Adam Smith notices and comments upon this work as written by Decker, and designates the scheme of taxation advocated in it as "the well-known proposal of Sir Matthew Decker," in the fifth book of his 'Wealth of Nations.' It is very evident however that it cannot be by the author of the 'Serious Considerations,' for various reasons. As Mr. McCulloch has remarked in his 'Literature of Political Economy,' p. 328, "the 'impôt unique,' or single tax, proposed by the author of the 'Essay' is quite different from that proposed in the 'Considerations'; it is, in his own words, 'one tax on the consumers of luxuries,' or, as Smith has put it, 'that all commodities, even those of which the consumption is either immediate or very speedy, should be taxed in this manner, the dealer advancing nothing, but the consumer paying a certain annual sum for the licence to consume certain goods.'" It may be added, that the edition of the 'Essay' published in 1756 is ushered in by a preface, evidently by the author, in which he speaks of this as a second edition, which he had been induced to prepare by the public demand, and in which he had taken an opportunity of correcting some things in the preceding impression. Decker, as we have seen, died in 1749. Mr. McCulloch states, that in a work by Francis Fauquier, entitled 'An Essay on Ways and Means for raising Money for the support of the present War without increasing the Public Debts,' third edition, 8vo, 1757, it is affirmed that the 'Essay on the Decline of Foreign Trade' was written by a Mr. Richardson.

This 'Essay' is rather a remarkable work. Besides his main project for a single tax, which occupies above 200 of the 228 pages of which the volume (in the 12mo edition) consists, he advances the four following proposals:—1, to abolish all our monopolies, unite Ireland, and put all our fellow-subjects on the same footing in trade; 2, to

withdraw the bounties on exported corn, and to erect public magazines of corn in every county; 3, to discourage idleness by well regulating our poor (he adopts Sir Josiah Child's plan for the management of the poor, and would transport all able-bodied persons who cannot find employment); and 4, to pay off our debts by public bonds, bearing interest, and liquidating part of our debts yearly. The balance of trade theory is assumed, but many of the remarks are both just and ingenious.

DECKER, or DEKKER, THOMAS, flourished as a dramatic author in the reign of James I., though the precise time of his birth and death, like that of many of his contemporaries, is uncertain. He is celebrated for a quarrel with Ben Jonson, who satirised him under the name of Crispinus in his 'Poetaster'; Decker returned the compliment by writing his 'Satyromastix,' wherein Jonson is attacked under the name of 'Young Horaces.' The author of the 'Biographia Dramatica' says that he became more famous from this quarrel than from any merit of his own. Later critics have however been more favourable to Decker, and Mr. Hazlitt pronounced the character of Friscoaldo in the 'Honest Whore' to be perfect in its way, as a picture of a broken-hearted father with a sneer on his lips and a tear-drop in his eye. This comedy is written with great power and with a high moral feeling. Decker composed many plays in union with other dramatists; and his name often occurs in connection with Chettle and others in Henalowe's 'Diary' as receiving small sums for plays written or promised. The collected works of Webster, Massinger, and Ford exhibit specimens of Decker's partnership-writing, though it is hard to assign the respective portions of productions of this sort to their right authors. Mr. Gifford has attributed all the gross indecencies of Massinger's 'Virgin Martyr' to the hand of Decker; but this is merely a guess, and is hardly a reasonable one. Of the plays written solely by Decker the 'Honest Whore' is the most celebrated, and is printed in Dodsley's Collection. Besides his dramatic works, his 'Gull's Hornbook' has become better known by an edition published a few years ago; it contains much valuable information illustrative of the manners of Decker's time.

DEE, JOHN, a distinguished astrologer and mathematician, was the son of a wealthy vintner, and born in London in 1527. Lilly says he was a Cambro-Briton, but this is not in accordance with better authorities. At the age of fifteen he was entered of St. John's College, Cambridge, where his attention seems to have been chiefly directed to mathematical, astronomical, and chemical studies; and his assiduity was there, as through life, even to extreme old age, truly remarkable. At twenty he made a twelvemonth's tour on the continent, chiefly in Holland, for the purpose of scientific intercourse; and returning to Cambridge, he was appointed one of the fellows of Trinity College, upon its foundation by Henry VIII. in 1543. In 1548 the suspicions entertained of his being addicted to the 'black art' induced him again to go abroad, having first taken his degree of A.M. Whether this prejudice really arose from his having already begun the astrological career for which he was in subsequent life so celebrated, or simply from his astronomical pursuits and his mechanical inventions, there is no distinct proof.

Dee's first residence on this second continental visit was the University of Louvain, at that period in high repute as a place of education; and he was there much esteemed for his mechanical skill and his intellectual resources, which, combined with his manly character, caused him to be visited by persons of the highest rank. Two years afterwards he went to France, where he read lectures on the 'Elements of Euclid' at Rheims. The character of the 'lectures' on Euclid was in those days extremely different from that of our own time. A series of speculations in all the sciences, whether physical, moral, or mental, were usually given under this title, the propositions of Euclid being taken as so many "pegs to hang a speech upon." The more visionary and romantic of the lecturers generally contrived to render a course on Euclid a discourse on all the dogmas of the schoolmen of the middle ages, whilst the more reasonable and sober of them confined their discourses to natural phenomena and the practical applications of geometry. It is almost unnecessary to say that a proof that "spirits would be in earth and heaven at the same time" (founded on Euclid I. 37), would be more attractive in an academical course than any 'vulgar mechanical' application of the same proposition could be. Of Dee's lectures we may form a tolerably good estimate from his preliminary discourse in Billingsley's 'English Euclid,' and a few other occasional paragraphs of his in that work. It places Dee's acquirements in a very favourable light; and his judgment, considering his time and circumstances, in one still more favourable. The dissertation of Dee is however to be found in works subsequently printed, and much more easily obtained; as in Leake and Serle's 'Euclid,' two or three editions, &c. To read that dissertation is sufficient to convince us that his lectures would be received at Rheims "with great applause," as indeed from direct testimony we otherwise know they were.

In 1551 Dee returned to England, and was presented to King Edward VI. by Cecil, and a pension of a hundred crowns was assigned to him. This he however relinquished for the rectory of Upton-on-Severn.

Shortly after the accession of Mary he was accused of "practising against the queen's life by enchantment;" so that his fame as a dealer

in the black art still clung to him. This charge was founded on some correspondence which was discovered between him and the "servants of the Lady Elizabeth;" and it led to a long and tedious imprisonment, with frequent examinations; but as nothing could be established against him, he was ultimately (1555) set at liberty by an order of the council.

On the accession of Elizabeth, Dee was consulted by Lord Dudley respecting "a propitious day" for the coronation. The queen, to whom he was presented, made him great promises. In 1564 he again visited the continent to present a book which he had written and dedicated to the Emperor Maximilian, under the title of 'Monas Hieroglyphica,' and which he printed at Antwerp in that year; and within the year he returned to England.

There is reason however to doubt whether the charge of neglecting Dee, brought against Elizabeth and her ministers, is well made out, however strongly and confidently it has been assumed and repeated. Even this visit to the court of Maximilian might have had an object very different from the ostensible one. There is much probability in Lilly's statement, who says:—"To be serious, he was Queen Elizabeth's intelligencer, and had a salary for his maintenance from the secretaries of state. He was a ready-witted man, quick of apprehension, and of great judgment in the Latin and Greek tongues. He was a very great investigator of the more secret hermetical learning, a perfect astronomer, a curious astrologer, a serious geometrician; to speak truth, he was excellent in all kinds of learning." (Lilly, 'Memoirs,' p. 224.) Where could a man better adapted to the purpose of 'secret intelligence' than such a one be found? This view too is borne out by many striking circumstances. Being in 1571 seized with a dangerous illness in Lorraine, the queen sent two physicians to his relief. This is an act the significance of which cannot be doubted.

He afterwards returned to England and settled at Mortlake in Surrey, where he led a life of privacy for some years, devoting himself to study with great ardour, and to the collecting of astronomical and philosophical instruments, not omitting of course a sufficient number of beryls, talismans, and the like. He seems also to have been consulted by persons respecting their horoscopes, &c. His reputation as one who dealt with the devil seems to have strongly manifested itself during this time in his own vicinity, as the mob in 1576 assembled, and destroyed all his collection, or nearly so; and it was with difficulty that he and his family escaped the fury of the rabble.

In 1578, the queen being much indisposed, Mr. Dee was sent abroad to consult with the German physicians and philosophers (or rather astrologers) relative to the means to be employed for her recovery. This was at least the ostensible object; but as no account of the result of this mission exists, except that we know that the queen recovered, we may perhaps infer that it was a secret political mission. After his return to England he was employed by the queen to draw up a condensed account of those countries which belonged to her crown, on the ground of being discovered by British subjects, both as to geographical description and the recorded and other evidence upon which her claim rested. With his usual activity he speedily accomplished his task, and in an incredibly short time he presented her majesty with two large rolls in which the discovered countries are geographically described and historically illustrated. These two curious manuscripts still exist in the Cottonian Collection in the British Museum. About this time, too, he paid much attention to the reformation of the Calendar, a treatise on which subject by him, and which is considered both "learned and rational," is still in manuscript in the Ashmolean Library at Oxford.

Most of the proceedings and writings upon which his fame with posterity as an astrologer rests, were written subsequent to this period, and he was now upwards of fifty years of age. This is not the general period at which men of activity both of mind and occupation sink into dotage; and it is impossible, taking into account several of the succeeding circumstances of the life of Dee, to imagine that this hypothesis can be applied to his case, in explanation of the extravagances which he perpetrated about this time, and soon after. The belief in supernatural agency was general at that period, and the belief in the power of controlling that agency was equally general—we may say universal. That Dee, admitting this in common with all the orthodox, whether of the Roman Catholic or reformed religion, was liable to be the dupe of crafty men, older than himself, is evident, and that with a strong and active imagination he should be led to interpret any sensible phenomena in accordance with it, is extremely probable. Whether he intended to be understood literally, or merely to express under those disguises information and memoranda of a very different nature, it is difficult now to determine. We incline to the latter opinion, and we think this view is borne out by circumstances; we shall however annex the usual account, which does indeed contain the ostensible view of his later life.

In the year 1581 he took into his service an apothecary of Worcester, named Edward Kelly, as an assistant. The "conversations with spirits" were held by Dee, in common with this person; and indeed Kelly was in general Dee's amanuensis during the time they were together. They had a speculum, which is generally said to have been "a polished piece of canal coal," but which was doubtless glass—one of the very 'stones' which Dee used being now in the British

Museum. In this glass the angels Gabriel and Raphael appeared at their invocation. Hence Butler says

"Kelly did all his feats upon
The devil's looking-glass—a stone."

The 'Book of Spirits' is not however to be considered a fair sample of Dee's absurdity, if taken literally; and we are not sure that Dee was himself the author of it. It was published in 1659, more than half a century after Dee's death, and hence its authenticity is questionable; but admitting its authenticity, it might have been a mere cipher, in which special passages that were worked into the general discourse were to be taken in a secretly specified order, so as to express other facts of a political nature. This was a favourite method of cipher at that period.

In 1583 a Polish noble, named Albert Laski, palatine of Siradia, being in England, Dee and Kelly were introduced to him, whether with a political object or not no direct evidence exists to inform us, but they accompanied him to Poland. It is said that the attachment arose from the similarity of their pursuits, that he soon became weary of them by finding himself abused by their idle pretensions, and that to get rid of them he persuaded them to pay a visit to Rodolph, king of Bohemia; that moreover, though a weak and credulous man, Rodolph was soon disgusted with their nonsense; and that they had no better success with the King of Poland; but that they were soon after invited by a rich Bohemian noble to his castle of Trebona, where they continued for some time in great affluence, owing, as they asserted, to their power of transforming the baser metals into gold.

It was very probably from the circumstance of Laski's being addicted to astrology and alchemy, as well as the King of Poland, that Dee was employed by the queen's crafty ministers as a fitting person for a political mission to that country, in the real character of a 'secret intelligencer.' It was in keeping with the unvarying policy of Elizabeth's government, and with the habits and previous occupation of Dee. The ridiculous pretensions which he and Kelly set up were well calculated to lull all suspicions of their real purpose. No other hypothesis seems capable of affording a key to Dee's conduct during this singular excursion; and all the circumstances admit of tolerably complete explanation by it. It is only fair to add however that Dee, in his private 'Diary,' which includes all the period of this Polish journey, gives no indication of any such secret object; but then he gives no indication of any purpose whatever for undertaking the journey, or for returning home when he did.

Kelly appears to have been one of those sordid and servile characters that look only at the immediate gain to be made of each single transaction, without having either principle or honour in his composition. Dee, on the contrary, was, as Lilly in his gossiping memoirs tells us, "the most ambitious man living, and most desirous of fame and renown, and was never so well pleased as when he heard himself styled Most Excellent." Lilly also gives a curious narrative of the means by which the servant Kelly obtained the art of transmutation from a poor friar, with whom Dee would have no intercourse; and that when the secret was obtained, the friar was made away with; and one reason given by this arch-knave of the Protectorate, Butler's 'Sidrophel,' why "many weaknesses in the manage of that way of Mosical learning ('conference with spirits,' in the book ascribed to Dee), was because Kelly was very vicious, unto whom the angels were not obedient, or willingly did declare the questions propounded."

Dee and Kelly separated in Bohemia, the former returning to England, the latter remaining at Prague. Of the circumstances attending this rupture nothing is certainly known; though the narrative given by Sidrophel is characteristic enough of Kelly's character. See William Lilly's History of his Life and Times from 1602 to 1681, p. 224, Baldwin's edition.

In 1595 the queen appointed Dee warden of Manchester College, he being then sixty-eight years of age. He resided there nine years; but from some cause not exactly known he left it in 1604, and returned to his house at Mortlake, where he spent the remainder of his days. He died in 1608, aged eighty-one, leaving a numerous family and a great number of works behind him. "He died," says Lilly, "very poor, enforced many times to sell some book or other to buy his dinner with, as Dr. Napier of Linford in Buckinghamshire oft related, who knew him very well:" but Dee was very extravagant in his style of living, and he had for many years been in pecuniary difficulties. Long before and during the period of his wardenship of Manchester College he appears from his 'Diary' to have been in the constant habit of borrowing money from his friends, and of raising small sums by pawning articles of plate, &c.

Dee's writings are very numerous, several of which still remain in manuscript. A catalogue of his printed writings may be seen in his 'Compendious Rehearsal,' or his letter to Whitgift; and from these it appears that he then had by him more than forty unpublished writings, the titles of which he gives. His 'Diary,' a curious record of his daily life during some important portion of his later life, was printed in 1842 by the Camden Society, and along with it the Catalogue of his library of Manuscripts, made by himself before his house was plundered by the populace: it is curious, as containing the titles of several works of mediæval date, not now known to be in existence. His library is said to have cost him 3000*l.*, a large sum for those days.

DEFFA'ND, MARIE DE VICHY, MARQUISE DU, daughter of Gaspard de Vichy, count of Champ Rond, was born in 1696. She had natural parts, wit, playfulness, and taste, which her education, expressly designed to fit her to shine in the saloons of the capital, tended to stimulate. In 1718 she married the Marquis du Defand, a colonel, and afterwards general in the French service. Having some time after separated from her husband, she had her own establishment, her parties, her admirers, and her petits soupers. She lived like many other ladies of rank and fashion of the times of the Regency and of Louis XV., and her correspondence throws much light on the manners of that age. She numbered among her friends and correspondents some of the most distinguished men of France, such as President Hénault, Montesquieu, Marmontel, D'Alembert, Voltaire, &c. After the death of her husband, in 1750, in order to accommodate herself to her reduced income, she gave up her establishment, and took apartments in the external or extra-claustral part of the Convent of St. Joseph, in the Rue St. Dominique, where she spent the remaining thirty years of her life. She continued however her evening parties, which were in great repute for wit, pleasantries, and bon ton, and to which most foreigners of distinction who resorted to Paris were introduced. Being afflicted with blindness, she took as a companion and reader an unprotected young person, Mlle. de l'Éspinasse; but she afterwards became jealous of her, and they parted; on which occasion Madame du Defand quarrelled with D'Alembert also. She continued, though blind, to correspond with her friends, and especially with Voltaire and Horace Walpole, to a very advanced age. She died at St. Joseph, in September 1780, in her eighty-fourth year. Madame du Defand possessed some very valuable qualities: she had real wit and taste without affectation, and much tact and sound judgment whenever caprice or prejudice did not lead her astray. She had a quick perception of merit of every kind, and her house was always open to it: she had a horror of dogmatism, exaggeration, and pedantry: although a free-thinker, she never partook of that absurd fanaticism against religion which characterised some of the philosophic writers of the 18th century. Her judgment was too calm and sober not to perceive the inconsistency of philosophical intolerance; she even gave some good advice to Voltaire on this subject, and was one of the very few who spoke frankly to him. Her 'Correspondance de Madame du Defand avec M. Walpole de 1766 à 1780, suivie de ses Lettres à M. de Voltaire de 1759 à 1775,' appeared in 4 vols. 8vo, 1810; and also 'Correspondance inédite de Madame du Defand avec D'Alembert, Montesquieu, le Président Hénault, &c., suivie des Lettres de M. de Voltaire à Madame du Defand,' 2 vols. 8vo, Paris, 1809, with a biographical notice.

DE FOE, DANIEL, the son of James Foe, a butcher in the parish of St. Giles, Cripplegate, was born in London in 1661. Of his youthful years we have nothing particular to relate. His father, who was a Dissenter, sent him to a Dissenting academy at Newington Green, conducted by Charles Morton, a man of learning, and a judicious teacher, where he remained till about 1680. As the only education he received was at this time, we may conclude that he applied with considerable advantage. In 1705 he challenged one of his adversaries "to translate with me any Latin, French, or Italian author, and after that to re-translate them crossways." He himself states that he had been educated for the ministry, but we have no information as to why his destination was altered. Different reasons have been assigned for his prefixing 'De' to the family name of Foe: the cause of his doing so has not been ascertained, but it was not adopted until after he had attained manhood. De Foe first appeared as an author in 1682, when he published a pamphlet against the prevalent high-church notions, under the title of 'Speculum Crape Gownorum; or, a Looking-Glass for the young Academics, new foilyd, with Reflections on some of the late high-flown Sermons; to which is added a Sermon of the Newest Fashion.' In 1738 he issued another pamphlet on the war that was then carried on between the Austrians and the Turks. Two years afterwards, his aversion to James II. and his government, and his zeal for the maintenance of Protestantism, induced him to enlist under the Duke of Monmouth, whose rash and ill-concerted conspiracy was the cause of so many executions. Our author had the good fortune to escape the fate that numbers of his companions suffered. After this he engaged in business; he calls himself a trader, and denies that he was "a hosier or an apprentice." He was probably a hose-factor and wool-dealer (in the prosecution of which latter branch of his business he is said by Wilson, in his 'Life and Times of De Foe,' to have made more than one voyage to Spain). His circumstances however became involved, and a commission of bankruptcy was taken out against him in 1692, but it was immediately superseded, his creditors accepting a composition, taking his own bonds for the payment.

In January 1687-88 he was admitted a freeman of the city of London; and in 1695 was appointed accountant to the commissioners for managing the duties on glass—a short-lived occupation, which he lost in 1699, when the tax was suppressed. During this period he published several pamphlets, chiefly on the 'Occasional Conformity of Dissenters,' which brought him into controversy with John Howe. He had devised many projects for the benefit of the country; and, when this commissionership was at an end, he determined to try one for his own advantage. This was for the manufacture of pantiles,

heretofore brought from Holland. The works were at Tilbury Fort, but they were not very successful as far as regarded profit, and his arrest in 1703 put a complete stop to the undertaking. De Foe's lively imagination, ardent temper, his eager interest in politics, and fondness for literature, disqualified him for commercial matters. He discovered this, and he never again ventured into business.

In the beginning of 1701 he published the 'True-born Englishman,' a pamphlet in answer to a libel on King William, which had been written by Tutchin. The sale of this work was quite unexampled. De Foe says had he enjoyed the profit of his own labour he would have gained 1000*l.*; but it was pirated, and 80,000 copies, published at a penny or twopence, were sold in the streets. The work however pleased the king, who not only admitted the author to an audience, but bestowed on him the more substantial reward of a present of money. In May 1701 the famous Petition of the Freeholders of Kent was presented; the House of Commons voted it to be "scandalous, insolent, and seditious," and committed the deputation who brought it up to prison. In a few days afterwards a packet was delivered to the speaker, as he entered the House of Commons, containing the 'Legion Memorial,' as it was called, sent by 200,000 Englishmen, declaring that the House had acted illegally in committing any one to prison for presenting any petition whatever, as the subject had a right to present any such in a peaceable way. The paper created a terrible commotion; a committee was appointed to inquire into the terrible conspiracy, and the king was prayed to stop these threatening petitions. The memorial was no doubt De Foe's, and it is most probable that it was delivered by himself. From the good-will that the king appeared to bear him, De Foe had hopes of again obtaining some public employment; but these expectations were soon destroyed by the death of the king and the accession of Queen Anne. In the new reign he could expect no favours from the government; he had always been obnoxious to the house of Stuart and its adherents. This source of profit then being dried up, without much chance of its re-opening, he betook himself diligently to his pen, to which alone he could safely trust for his subsistence. He wrote with unwearied assiduity; but the loss of his patron, the king, was soon severely felt. By an ironical pamphlet, called 'The Shortest Way with the Dissenters,' he gave bitter offence to many powerful bodies in the state. The High Church party resented it as a libel, and offered a reward for the apprehension of the author. The House of Commons (February 25, 1702-3) angrily resolved that this scandalous book should be burnt by the common hangman; and the secretary of state issued the following proclamation:—"Whereas Daniel De Foe, alias De Fooe, is charged with writing a scandalous and seditious pamphlet, entitled 'The Shortest Way with the Dissenters.' He is a middle-sized spare man, about forty years old, of a brown complexion, and dark-brown coloured hair, but wears a wig: a hooked nose, a sharp chin, gray eyes, and a large mole near his mouth; was born in London, and for many years was a hosiery factor in Freeman's Yard in Cornhill, and now is owner of the brick and pantile work near Tilbury Fort in Essex. Whoever shall discover the said Daniel De Foe to one of her Majesty's principal secretaries of state, or any of her Majesty's justices of peace, so as he may be apprehended, shall have a reward of 50*l.*: to be paid upon such discovery." He was shortly after caught, fined, pilloried, and imprisoned. "Thus," says he, "was I a second time ruined; for by this affair I lost above 3500*l.*" (Ballantyne's 'Mem. of De Foe,' in Sir W. Scott's 'Prose Works,' vol. iv.) During the time that he was confined in Newgate, he wrote a 'Hymn to the Pillory,' published pamphlets and poems, and matured a scheme for 'The Review,' a paper exclusively written by himself, which for more than nine years he continued to publish twice or three times a week. After he had been a prisoner for more than a year, Harley, who was then secretary of state, interceded with the queen for his release, who at once sent money to his wife, who was in great distress, and, after some delay, paid his fine and set him at liberty. De Foe, once more free, took a house at Bury St. Edmunds, whither he removed with his wife and children, and recommenced his literary labours. He did not continue there very long; and he states that both Harley and Godolphin employed him in the service of the queen, commissions attended "oftentimes with difficulty and danger," and once in a "foreign country." He also continued to pour forth pamphlets in verse and prose, on "religious and political subjects;" one of them was the 'True Relation of the Apparition of one Mrs. Veal,' affixed to a translation of 'Drelincourt on Death,' which carried off an edition of that work which had been for a long time lumbering the publisher's shelves, and caused many other editions to be subsequently issued.

In 1706 De Foe was recommended by Lord Godolphin to the queen as a fit and proper person to send to Scotland to promote the Union. This business being entrusted to him, he resided in Edinburgh until the end of 1707, when, returning to London, he wrote an account of the subject with which he had been engaged, which was published in 1709. For his services during this mission the queen granted him a pension, which political changes not long permitting him to enjoy, he was again compelled to gain his livelihood by writing. The attacks in his political pamphlets now a second time got him into difficulties; for two papers, one entitled 'What if the Queen should die?' the other called 'What if the Pretender should come?' (the works were

palpably ironical, but he was again misunderstood), he was fined 800*l.*, and in default of payment was committed to Newgate. His second was not so long as his first imprisonment; he was liberated by the queen in November 1713.

After the death of Anne, in 1714, his enemies so assailed him from every quarter, that he was compelled in self-defence to draw up an account of his political conduct, and of the sufferings he had endured. The continual attacks of his opponents so weighed upon his mind and depressed his spirits, that his health gave way, and an illness was brought on which terminated in an apoplectic fit. When he recovered, he continued to write, but thought it prudent to desert his old field of political satire and invective, and to enter upon new ones. His first production was of a religious character, the 'Family Instructor,' published anonymously in 1716, which became so popular that in 1722 he wrote 'Religious Courtship,' which was equally successful. To afford entertainment by tales of fiction was his next task, and he put forth, in 1719, when he was fifty-eight years old, the first part of his inimitable 'Adventures of Robinson Crusoe,' which no story has ever exceeded in popularity. The merits of this work have been disparaged on account of its want of originality; "but really the story of Selkirk, which had been published a few years before, appears to have furnished our author with so little beyond the bare idea of a man living on an uninhabited island, that it seems quite immaterial whether he took his hint from that or any other similar story." (Sir Walter Scott, 'Prose Works.') The great success and profits arising from the first induced him to write a second and third part, each of which had less merit than its predecessor, the last being a mere book-making job. We have not space to enumerate the multitude of pamphlets and books which our author published. 'The Adventures of Captain Singleton,' 'The Fortunes of Moll Flanders,' 'The History of Colonel Jack,' 'The Fortunate Mistress,' 'The Memoirs of a Cavalier,' and 'The History of the Plague,' which were among the most popular of his works that succeeded 'Robinson Crusoe,' form only a small portion of his writings. His biographers, Chalmers and Wilson, have published catalogues of the writings of De Foe, and one was also published as a pamphlet by Thomas Rodd, but it is very probable that they are incomplete, and that many of his works which were only of a temporary interest have been lost.

De Foe died at the age of seventy, on the 24th of April 1731, in the parish of St. Giles's, Cripplegate. He left a widow and several children, among whom was Norton De Foe, the author of 'Memoirs of the Princes of the House of Orange,' who is thus satirised in Pope's Dunciad:—

"Norton from Daniel and Ostraea sprung,
Bless'd with his father's front and mother's tongue."

A great-grandson is yet (1856) living, reduced at the age of seventy-eight from the position of a master tradesman to poverty, for whom in 1854 and 1855 a fund was raised to prevent a descendant of so great an ornament to his country becoming like his ancestor a sufferer and a sacrifice to extreme want.

De Foe's powers as a writer are of no ordinary stamp. He was not a poet, but he could write vigorous verse, and his satire is bold and trenchant. If he had been in affluent circumstances he might have written less and with more care, but his necessities often drove him to the printing-press. The disputes of the time afforded an inexhaustible fund of topics, and the violence of party spirit was displayed by all factions in pamphlets, which were the weapons of political warfare. To this style of writing De Foe had two reasons for applying himself; first, because it was the surest to meet with a ready sale, and to bring him in a pecuniary return; and secondly, because he was himself an eager politician. As a Whig, he opposed the House of Stuart; as a Protestant, he wrote against Catholicism; and as a Dissenter, against the church. His attention however was not confined to the hackneyed topics of the succession and the church: he treated of finance, trade, and bankruptcy, as well as of the union with Scotland; and all this, independently of his Review, which contained articles on foreign and domestic intelligence, politics, and commerce. "The fertility of De Foe," says Sir Walter Scott, "was astonishing. He wrote on all occasions, and on all subjects, and seemingly had little time for preparation on the subject in hand, but treated it from the stores which his memory retained of early reading, and such hints as he had caught up in society, not one of which seems to have been lost upon him." ('Prose Works.') Of his Review, we believe no complete copy is in existence: however great was the interest that it excited during the time of its publication, which continued for nine years. But it is not for the class of writings that we have been speaking of, although they were of undoubted ability, that De Foe chiefly is and will continue to be celebrated; it is by his popular narratives that his great fame has been obtained. Of these we may reckon three kinds:—1st, The account of remarkable occurrences, as the 'Journal of the Plague Year,' and the 'Memoirs of a Cavalier'; 2nd, The account of mariners, privateers, thieves, swindlers, and robbers, as 'Robinson Crusoe,' the piracies of 'Captain Singleton,' the histories of 'Colonel Jack,' 'Moll Flanders,' and 'Roxana'; 3rd, The descriptions of supernatural appearances, as the 'Life of Duncan Campbell,' a 'Treatise on Spirits and Apparitions,' the very degenerate third part of 'Robinson Crusoe,' and the 'Appa-

rition of Mrs. Veal.' De Foe's minute and accurate knowledge of the lower walks of human life was no doubt acquired in the various positions in which he was himself placed, joined to an acute observation, and long treasured and matured in his mind. His style has a colloquial ease, but also a colloquial negligence; it is genuine English; thoroughly idiomatic, but by no means faultless. The remarkable quality of his writings is, the appearance of reality that is given to fiction. By a particularity and minuteness of description which his skill prevents from being tedious, he increases the probability of his story, adds to its interest, and carries forward his reader. No author of imaginary tales has impressed so many persons with the belief that they have been reading a true rather than a fictitious narrative.

(Sir Walter Scott, *Biog. prefixed to the edition of De Foe's Works*; Wilson, *Life of De Foe*; Forster, *Essay on De Foe*.)

DEIOTARUS, a tetrarch or prince of Galatia, or Gallo-Grecia, was the ally of Rome in the wars against Mithridates, for which he was rewarded by the grant of part of Pontus and Little Armenia, with the title of king given to him by the Roman senate. Cicero, during his government of Cilicia, became acquainted with him, and received assistance from him against the Parthians. In the civil war between Cæsar and Pompey, Deiotarus took part with Pompey, and was in consequence deprived by Cæsar of part of his dominions. After Cæsar's return from Spain, Deiotarus was accused by his own grandson, Castor, of having attempted to assassinate Cæsar, while the latter was in Asia. Cicero pleaded before Cæsar in favour of his old friend ('*Oratio pro Rege Deiotaro*.) After Cæsar's death, Deiotarus recovered possession of his territories; he at first took part with Brutus, but afterwards made his peace with the triumvirs, and subsequently favoured Octavius against Antony in his final struggle for the empire. Deiotarus was then very old, but the precise time of his death is not known.

Coin of Deiotarus.

British Museum. Actual size. Copper. Weight 170 grains.

DEKKER, THOMAS. [DEKKER, THOMAS.]

DE LA BECHE, SIR HENRY THOMAS, an eminent geologist. He was the only son of Colonel Thomas de la Beche of Halse Hall, Jamaica, and represented the old family of De la Beche, who lived at Aldworth, near Reading, in the 13th and 14th centuries. Sir Henry was born near London in 1796. He went to Jamaica when young, where his father died, and whilst returning to Europe his mother and her young son suffered shipwreck. On reaching England they lived at Charmouth and Lyme Regis, where the young De la Beche seems to have acquired his first taste for geology. He was educated at the military school at Great Marlow, which was afterwards removed to Sandhurst. He entered the army in 1814. In 1817 he became a Fellow of the Geological Society; he afterwards became Secretary and Foreign Secretary of this society, and eventually, in 1847, President. In 1818 he married. Before this event he had begun to investigate the geology of Devon, Dorset, and Pembrokeshire; he now travelled on the continent, and dwelt for some time in Switzerland. Here in 1820 he produced one of his earliest scientific papers, 'On the temperature and depth of the Lake of Geneva.' This was first published in the '*Bibliothèque Universelle*,' and afterwards in the '*Edinburgh Philosophical Journal*.' The researches which led to the publication of this paper exercised an important influence on all his subsequent career. He subsequently returned to England, and renewed his labours on the geology of Wales and Devonshire. In conjunction with the Rev. Mr. Conybeare, now the Dean of Llandaff, he first made known the singular form of the *Plesiosaurus*. This was done in a paper published in 1823 in the '*Transactions of the Geological Society*,' and entitled 'On the Discovery of a new fossil animal, forming a link between the Ichthyosaurus and Crocodile.'

In 1824 Mr. de la Beche visited his paternal estates in Jamaica. Here he made himself remarkable for attempting to introduce ameliorations in the condition of the slave. He suffered considerably from the Act of Emancipation. Whilst in Jamaica he lost no opportunity of pursuing his favourite science, and a paper published in 1826 in the '*Transactions of the Geological Society*,' on the 'Geology of Jamaica,' was the result. Having returned to England, his papers on the geology of Dorset, Devon, and Wales became very numerous, besides others on the general principles of geological enquiry. Such were his papers on the 'Classification of European Rocks,' 'On the Excavation of Valleys,' 'On the Geographical Distribution of Organic Remains,' 'On the Formation of Extensive Conglomerate and Gravel Deposits,' and many others. In 1831 he published his '*Geological Manual*,'

which went through several editions and was translated into French and German soon after its appearance in England. In this year he also projected a plan of forming a geological map of England, in which all the details of the various formations should be accurately laid down. He began this gigantic undertaking on his own responsibility, and commenced a map of Cornwall. This resulted in the government instituting the Geological Survey, at the head of which he was placed. Whilst working out his plans, he became possessed of a large collection of specimens of rocks and mineral substances used in the arts. This collection served as the nucleus of the Museum of Practical Geology, which was at first deposited in a house in Craig's Court. In 1834 he published '*Researches in Theoretical Geology*,' and in 1835, '*How to Observe Geology*.' In 1845 the Geological Survey and Museum of Practical Geology were united, and the building in Jermyn Street, Westminster, erected for the reception of the rapidly increasing collection of the latter. Sir Henry succeeded in attracting to this institution a number of ardent young men of science, amongst whom we may mention the late Professor E. Forbes, and through their labours this institution rapidly became one of the most important scientific bodies in the country. In 1851 courses of lectures were given by the various members of the corps, and under the name of the Government School of Mines, they are carried on with increasing vigour and usefulness under the presidency of Sir Henry's successor, Sir Roderick Murchison.

For several years previous to his death Sir Henry had suffered from a gradually increasing paralytic disorder, which, although it prevented him using his limbs, left his fine intellect almost unimpaired. Day after day it was evident that his frame became feebler, but his attention to the interests of the school he had founded did not diminish, and till within two days of his death he performed the active duties of his responsible position. He died on the 11th of April 1856.

The distinguishing feature of Sir Henry's mind was its eminently practical character. The establishment of the Geological Survey and the School of Mines was a proof of this. Wherever his knowledge could be made available for practical purposes, his services were at the command of the public. Thus we find him becoming a member of the Health of Towns Commission and also of the Commission of Sewers. He was chairman of one of the juries of the Great Exhibition in 1851. With Sir Charles Barry he formed one of a committee to select building-stones for the New Houses of Parliament. He was associated with Dr. Lyon Playfair in reporting to the government on the coals suited to the steam-navy, also with Dr. Playfair and Mr. Smyth in reporting on the gases and explosions in collieries. He was elected a Fellow of the Royal Society in 1819, in 1848 he had conferred on him the honour of knighthood, and in 1853 he was elected a corresponding member of the Academy of Sciences of Paris.

* DELACROIX, FERDINAND-VICTOR-EUGENE, a celebrated French painter, was born at Charenton-Saint-Maurice, near Paris, on the 26th of April 1799. His father, Charles Delacroix de Constant, was a somewhat prominent member of the convention from the trial of Louis XVI. down to the death of Robespierre, when he was a member of the most violent section of the Thermidorians; he then held the offices of secretary of the 'Conseil des Anciens,' and minister for foreign affairs till July 1797, when he went to Holland as ambassador; and finally, on the triumph of Bonaparte he abandoned republicanism and became prefect of the Bouches-du-Rhône, and of the Gironde; he died in 1805.

The young Delacroix received a good education, but left college early. At the age of eighteen he entered the Academy of Art, then presided over by Guérin, but from the first he rebelled against the classic tastes of his teacher. Delacroix exhibited his first picture, 'Dante and Virgil making their passage round the Infernal City,' at the Salon in 1822. It was a bold and uncompromising departure from the cold correctness of manner then in vogue, and, as its great ability was undeniable, it excited no little critical controversy. Among its most ardent defenders was M. Thiers, then a newspaper critic, who pronounced it the work of one for whom was evidently destined a great future. 'The Massacre of Scio,' another large work which was exhibited the following year, strengthened the opinions both of admirers and opponents; and the young artist at once became the acknowledged chief of what was designated the Romantic school, by the adherents of the hitherto prevalent classic school. Both the pictures just named have been purchased for the national collection, and now adorn the walls of the Luxembourg.

From this time, although M. Delacroix had to bear much rough criticism, his position was assured; and the numerous important works he continued to produce were received with enthusiasm by a constantly increasing body of disciples and admirers. Among the more important of his earlier works may be named the 'Doge Marino Fialero decapité,' 'Christ in the Garden,' 'Mephistopheles appearing to Faust,' 'Justinian,' for the Salon of the Council of State; 'Sardanapale mourant, au milieu de ses femmes, qu'on égorge,' 'Milton dictating Paradise Lost to his Daughters,' 'Cardinal Richelieu, surrounded by his Guards, officiating in the chapel of the Palais Royal,' 'Combat du Giaour et du Pacha,' purchased by the Museum of Nantes. The revolution of 1830 supplied him with new subjects; he produced in that year 'La Liberté guidant le Peuple sur les Barricades,' now in the Louvre. Some other revolutionary pictures followed; but his

artistic powers received a new direction by the offer of a passage as attaché to a government mission to Morocco. One of the first works suggested by his eastern travels was 'Les Femmes d'Alger,' exhibited in 1834, and now in the gallery of the Luxembourg,—a work which it was the general opinion of the Parisian world of art placed M. Delacroix at least on a level with Rubens as a colourist. M. Thiers was now minister of the interior, and he gave the painter, whose eminence he had foretold, an opportunity of displaying his genius in a higher walk of art than he had yet essayed, by confiding to him the task of painting the walls of the Salon du Roi, at the Palais Bourbon. On this work M. Delacroix was engaged from 1834 to 1837. The paintings are symbolical, and represent justice, law, war, agriculture, industry, peace, &c., and they are regarded as very fine examples of the artist's more elevated style. He has adorned also the library of the same palace with paintings of the 'Golden Age' and the 'Invasion of Attila.' The admiration excited by these works led to his being called upon to paint portions of the interior of various other public buildings in Paris, including the Hôtel de Ville, the Luxembourg, and the Louvre, as well as several churches: indeed M. Delacroix has probably executed more great works of this high class than any other contemporary French artist. But his public commissions have been so far from absorbing his time that, during their execution he has produced a succession of important gallery and cabinet paintings, among which may be named his famous 'Medea,' now in the gallery of the Luxembourg, a 'Cleopatra,' the 'Battle of Taillebourg,' for the gallery at Versailles, 'Hamlet with the skull of Yorick,' the 'Taking of Constantinople by the Latins,' 'Christ at the Tomb,' 'Resurrection of Lazarus,' 'Une Odalisque,' 'Femmes d'Alger dans leurs intérieurs,' and numerous other scriptural and eastern subjects, as well as several from the works of Shakspeare, Scott, &c., and a few portraits, among which is a well known one of Madame Dudevant in male attire.

M. Eugène Delacroix will not assuredly take ultimately anything like the rank his more enthusiastic admirers claim for him; but he is a man of great mental power, and that he always impresses on his works: and his influence on contemporary French art has unquestionably been very great. What most characterises his paintings is a certain impetuous energy of style, evident alike in the full though often inaccurate drawing—as though his fiery temperament would not permit him to stay to correct—the freedom of composition often producing very striking but not seldom harsh and ungainly effects; the vivid but frequently inharmonious colouring; the crude though decided light and shade; and the rough rapid mode of execution. He paints in a free bold manner, with a firm touch, occasionally loading his canvas with colour; and he shows a daring neglect of minute detail singularly at variance with the mincing stroke and elaborate finish affected by our rising historical and genre painters. His admirers compare him with Paolo Veronese. He himself is an ardent admirer of that great master, but he turns with more affection to Rubens and our own Constable—whose influence on the present race of French painters is more considerable than is supposed—and we should be disposed to say, if we were required to indicate his models, that whilst he retains a very decided originality of conception, he may be regarded as far as the mere technicalities of art are concerned, as a French compound of the colour of Rubens with the impasto of Constable: but he falls far short of the voluptuous richness of the one and the freshness of the other.

M. Delacroix has made several lithographic drawings, and written a few characteristic papers on painting in the 'Revue des Deux Mondes.' (*Planche, Portraits des Artistes Contemporains; Dict. Biog. Gen.; Art-Journal*, Nov. 1848; &c.)

DELABRE, JEAN-BAPTISTE-JOSEPH, was born at Amiens, September 10, 1749. His course of study was at the gymnasium of his native town. His excellent disposition, great perseverance, and extraordinary memory, early attracted the notice of his teacher in the college, the poet l'Abbé Delisle; and the friendship commenced between Delisle and Delambre, while they stood in the relation of preceptor and pupil, was continued unabated during the remaining part of Delisle's life; and Delambre used to express his obligations to that eminent man with great feeling to the latest period of his life.

Delambre was desirous of pursuing his studies in Paris, but his pecuniary means were inadequate to the expenses in which he would be necessarily involved by such a course. The influence of Delisle however procured for him an exhibition to one of the colleges which was in the gift of his native town, and which it has been commonly said was first founded by one of Delambre's own family. The time during which he was entitled to hold it having expired, and his family being unable to furnish him the requisite assistance to prolong the period of his studies, he was compelled to adopt some means of supporting himself. After more than a year of disappointment, indecision, and privation, he undertook the occupation of translating foreign works into French; and many such translations from the Latin, Greek, Italian, and English writers were executed by him during the first fifteen years after he left college. In addition to this employment he gave lessons in languages to private pupils; and by the combined emoluments of these labours he was not only able to supply his small personal wants, but to make an excellent collection of the best authors in the several languages which he studied.

The parsimonious views of parents on the subject of education have been witnessed by every one whose life has been devoted to instruction, under circumstances similar to those of Delambre. Their continual importunity to men eminent in some one pursuit, whom they have employed, to undertake others with which they have little or no acquaintance, and this for the sake of diminishing the expense of education, is proverbial. It was this continual application to Delambre, who was distinguished both in the philological and philosophical departments of language, to teach mathematics, which induced him at the age of twenty-five to enter upon the study of the exact sciences. Most men would have been soon wearied of a pursuit so undertaken; and this would have been the case with Delambre, had his mental discipline been merely that of exercising the memory, which is unfortunately too much the tendency of the exclusive study of languages. Order and perseverance were distinguishing characters of Delambre's mind; and having from professional motives entered on the study of mathematics, and thereby become attached to their pursuit, he determined to pursue a regular course of study in these sciences. He entered the astronomical class of the College of France under Lalande, but not till he had carefully read the works of his master, and made many notes upon them, amounting almost to a commentary.

On one occasion, shortly after he joined the class, a passage from Aratus was required, which Delambre instantly supplied from memory. Lalande, ever alive to the importance of astronomical history, was immediately interested in Delambre; and it is probable that to this circumstance much of the future fame and labours of Delambre are to be attributed, as Lalande became immediately his friend, and henceforth considered Delambre as his fellow-labourer. Many of the most complicated calculations of Lalande were actually performed by Delambre; but though our author probably entered upon much of this drudgery for pecuniary considerations, he has given ample proof that the labour was far from a disagreeable one to him, by the tables which he himself subsequently published in later life.

During a short residence at Compiègne, which he made while he was a professed teacher of languages, he appears to have paid some attention to plane-astronomy; and when he formed a friendship with Lalande, M. Dassy, in whose family Delambre was domiciled as tutor to his sons, was prevailed on by the astronomer to fit up a small observatory for his use. In this Delambre acquired some skill in the manipulation of his instruments, and also in the management of the formulae which are used in the particular classes of data that the structure of instruments enables us to obtain. He then determined to devote his life to astronomy and its history. The learning requisite for the history of astronomy he had already obtained, though he had probably at this time read comparatively few of the books, and none of the manuscripts, which so arduous a task entailed upon him; whilst of the incessant labour required by the study of astronomy as a science he had possibly little idea, and of the skill which his future practice gave him his share was also very small. His ardour and perseverance however surmounted all the obstacles that opposed his progress; and never did any man more completely illustrate the trite proverb, 'labor omnia vincit,' than Delambre.

When in 1781 the discovery of the planet Herschel was exciting the deep attention of astronomers, Delambre undertook the formation of tables of its motion, being probably urged to this by the Academy of Sciences having proposed the determination of its orbit as the prize of the year. That prize was awarded to Delambre. He then undertook the construction of his solar tables, as well as tables of the motions of Jupiter and Saturn. Shortly afterwards he commenced his tables of the eclipses of Jupiter, which occupied him some years. When at a sitting of the Academy Laplace communicated to that body the results of his researches on the inequalities of Jupiter and Saturn, Delambre determined on constructing complete tables of the motions of those two planets, founded on those results, but more especially of those of Jupiter. The utility of such tables to the navigator was a strong inducement to this undertaking, which he entered upon with great ardour, and completed in an almost incredibly short period, when we consider the great labour which they involved. His ecliptical tables were presented to the Academy in 1792, as a competing paper for the prize on that subject which had been offered the preceding year; but he had been for several years engaged in their calculation. It is indeed very probable that the prize was offered to induce him to complete them, as it was well known that he was engaged in the preparation of such tables. Such indeed is well known to be the general practice of that body; and though it has occasionally done good, in bringing to a completion researches that might not so soon have been completed, it does this mischief—that it almost cuts off all competition, and inevitably gives the prize to a single candidate, by allowing him the advantage of a long previous preparation for it. We cannot disapprove of the adjudication on this occasion, as Delambre's labours well merited the distinction; but we do not think the general practice calculated on the whole to do other than give solat to the members of the Institute themselves or their immediate friends.

When the project of fixing a standard of length was acceded to by the governments of France and England, Delambre and Méchain were appointed to carry it into execution on the part of the former government, by measuring the arc from Dunkirk to Barcelona. This laborious undertaking was carried on during the horrors of the French revolution,

amidst almost every variety of difficulty and personal danger that can be conceived. Méchain dying during the progress of the work, the completion of it devolved wholly on Delambre. His perseverance, prudence, and zeal however eventually overcame all obstacles; and after eight years of unceasing labour and anxiety he obtained the measurements which constitute the data of the three volumes (1806-10) of his elaborate and invaluable work, 'Base du Système Métrique Décimal.' The Institute of France, which had watched over its progress, decreed him the prize for the most valuable work on physical science which had appeared within the preceding ten years; and it is difficult to conceive that a single objection could possibly arise to the propriety of that decision.

Of the continuation of Delambre's arc by Biot and Arago from Barcelona to Formentera, this is not the place to speak at length; but it may be necessary to state that discrepancies which had long been observed in this latter arc were found by Puissant to arise out of actual errors committed by these observers.

Delambre was chosen an associate of almost every learned body in Europe, and was appointed by the French government a member of the Bureau des Longitudes, and Secrétaire Perpetuel de l'Institut de France, and one of the directors of the University of France. During the twenty years that he filled this latter important and responsible post, his attention to its duties was unwavering, and his decisions remarkable for their justice and impartiality. His eulogies of the deceased savans were indeed at the time considered somewhat strained as to praise; but they were at least kindly meant to the friends of the deceased, and were gratifying to the vanity of the nation. They were remarkable for purity of style and for the researches into the history of the subjects to which the eulogised member had devoted himself.

In 1814 Delambre was appointed a member of the Council of Public Instruction, but was deprived of it in the following year. He was in Paris when it was taken by the allied armies; and shortly afterwards, writing to one of his friends, he says he worked with perfect tranquillity from eight in the morning till midnight in the continued hearing of the cannonade. Such self-possession for study under that tremendous attack, and such absence of interest in the result of the great struggle, to say nothing of indifference to personal danger, is what we confess ourselves unable to understand. In the midst of active exertion we may be fearless of personal danger; but Delambre was in his study, and professes to have felt not only perfectly calm but to have been able to pursue his scientific labours for sixteen hours in the very midst of the cannonade. He escaped uninjured.

On the creation of the Legion of Honour, Delambre was constituted a member of that body, and soon after an hereditary chevalier, with a pension, as a reward for his scientific services; and finally, in 1821 he was created an officer of that body. In 1817 he was created a chevalier of the order of St. Michael.

The death of Delambre occurred on the 19th of August 1822, at the age of seventy-two. It was preceded by a total loss of strength and frequent and long-continued fainting-fits, with the other symptoms of a constitution worn out by hard mental and bodily labour. He died as he had lived, calmly, and though not without great suffering, yet without a single complaint.

The writings of Delambre are exceedingly numerous. The following is a list of his separate works in the order of their publication:—1, 'Tables de Jupiter et de Saturne,' 1789; 2, 'Tables du Soleil, de Jupiter, de Saturne, d'Uranus, et des Satellites de Jupiter, pour servir à la 3me édition de l'Astronomie de Lalande,' 1792; 3, 'Méthodes Analytiques pour la détermination d'un Arc du Méridien,' 1799; 4, 'Tables Trigonométriques Décimales,' par Borda, revues, augmentées, publiées par M. Delambre,' 1801; 5, 'Tables du Soleil,' publiées par le Bureau des Longitudes, 1806; 6, 'Base du Système Métrique Décimal,' 3 vols., 1806-10; 7, 'Rapport Historique sur les Progrès des Sciences Mathématiques depuis 1780,' 1810; 8, 'Abrégé d'Astronomie, ou Leçons Élémentaires d'Astronomie Théorique et Pratique'; 9, 'Astronomie Théorique et Pratique,' 4to, 3 vols., 1814; 10, 'Tables Écliptiques des Satellites de Jupiter,' 1817; 11, 'Histoire de l'Astronomie Ancienne,' 2 vols. 4to, 1817; 12, 'Histoire de l'Astronomie du Moyen Âge,' 1 vol. 4to, 1819; 13, 'Histoire de l'Astronomie Moderne,' 2 vols. 4to, 1821; 14, 'Histoire de l'Astronomie au Dix-huitième Siècle,' 4to, 1827, published under the care of Matthieu.

Besides these separate works, Delambre published a considerable number of memoirs in the collections of Petersburg, Turin, Stockholm, and Berlin, independently of those which appeared in the 'Mémoires de l'Institut de France'; also twenty-eight memoirs on different subjects (astronomy, geodesy, and astronomical history) in the 'Connaissance des Temps,' from 1783 to 1820. A list of these may be seen in Coste's indexes to that work for 1807 and 1822.

Any attempt to analyse the writings of Delambre would far exceed the limits which can be allowed in this Cyclopædia. It is sufficient to say they are well worthy of the praise which has been bestowed upon them, as they are not only all excellent in their kind, but throughout marked with an original mind, indicate the most devoted enthusiasm to their several subjects, and prove that their author combined the spirit of scientific inquiry with the feelings and habits of literature in a degree that the history of a single individual has hardly ever before or since exhibited.

* DELAROCHE, PAUL, an eminent French painter, was born at

Paris in 1797. Early intending to follow art as a profession, he at first studied landscape, and was in 1817 an unsuccessful candidate for the Academy prize in landscape-painting. Convinced that landscape-painting was not his vocation, he entered the atelier of Baron Gros, under whose guidance he made rapid progress in the study of the figure. Gros had himself in a great measure thrown off the classic trammels which his master David had fixed on French art [GROS, BARON, A. J.], and Delaroche entirely emancipated himself from their thralldom. But he did not, like Delacroix, go to the opposite extreme. He still adhered to the old laws, and many of the conventionalities of art. Choosing his subjects to a great extent from modern history, and painting without much regard to academic attitudes and arrangements, he yet sought to maintain something of the old sobriety and dignity of the historic style, and hence when his superiority in his chosen line came to be generally recognised, and Delaroche was the acknowledged chief of a school, that school received the name of the 'Eclectics,' in contradistinction to the Romantic school of Delacroix and the Classic school of David and his followers.

Paul Delaroche in 1819 and the following years exhibited some paintings of scriptural subjects, but it was not till 1824 that the earliest of that class of works by which he achieved his fame appeared; these were, 'St. Vincent de Paul preaching in the presence of Louis XIII.,' and 'Jeanne d'Arc interrogated in prison by Cardinal Beaufort,' which produced a considerable impression. In 1826 M. Delaroche exhibited the first of his very remarkable paintings from English history—'The Death of Queen Elizabeth.' This picture was purchased for the gallery of the Luxembourg, and is thought by French critics to display a wonderful knowledge of English history and English character. It is really the worst of his English pictures, and renders with abundant exaggeration the coarse notion of Elizabeth which alone continental artists and poets seem capable of conceiving: some of the draperies are however very well painted, as indeed his draperies mostly are. When M. Delaroche a few years later (1831) again trod on English ground he was a good deal more successful; his 'Children of Edward IV. in the Tower,' being of its class a very excellent picture: it is well known in this country by engravings. But of a far higher order was his next great English picture, 'Cromwell contemplating the corpse of Charles I.' He has here imagined a circumstance in itself sufficiently probable, and he has treated it with a calm dignity worthy of the theme. M. Delaroche has been often charged with sacrificing his principal subject to the accessories by his excessive care in the rendering of them, but here the attention is at once arrested by the thoughtful head of the Protector, directed to the lifeless form he is brooding over, and it never wanders from the victim and the victor. The sombre colour and gloomy shades are entirely in unison with the prevalent impression. Simple as is the idea of the picture, it would perhaps be difficult to name another modern painting which so thoroughly succeeds in carrying the mind of the spectator into the very presence of the man represented. This fine picture is now in the possession of the Earl of Ellesmere, but M. Delaroche has painted, we believe, more than one repetition of it; it has been very popular also as an engraving.

His other more important pictures from English history are the 'Execution of Lady Jane Grey' (1834); 'Charles I. in the Guard-room, insulted by the Parliamentary Soldiers' (1837), now in the collection of the Earl of Ellesmere, and well engraved by A. Martinel; 'Lord Strafford on his way to the Scaffold receiving the Blessing of Archbishop Laud' (1837), a companion picture to that of 'Cromwell contemplating the Corpse of Charles,' and equally well known by the engravings, but certainly far less impressive as a work of mind, and inferior in its technical qualities: the original is in the collection of the Duke of Sutherland. M. Delaroche has also painted some illustrations of Scott's novels.

Among the subjects from French history may be named 'Une Scène de la St. Barthélemy' (1826); 'Le Cardinal de Richelieu sur le Rhône, conduisant au supplice Cinq Mars et de Thou,' and a companion, 'Le Cardinal Mazarin mourant' (1831), both of which, as pictures, and in the engravings by F. Giraud, were very popular; 'La Mort du Duc de Guise' (1835), one of his best pictures; 'La Reine Marie-Antoinette après sa Condamnation à Mort,' and finally his universally popular pictures of 'Napoleon at Fontainebleau,' and 'Napoleon Crossing the Alps,' of which he has been required to paint several repetitions and smaller copies. His other pictures and portraits are very numerous.

Perhaps the most remarkable of Delaroche's productions however is his painting of the hemicycle of the Palais des Beaux Arts, in which he has represented the great painters, sculptors, and architects from the earliest time down to the present. From the centre, where Apelles, Phidias, and Ictinus are enthroned as the representatives of the arts in ancient Greece, and marshalled under figures which symbolise the principal eras in the history of art, the great sculptors and architects are ranged in groups, the painters occupying the extremities. The artists in some instances chosen, and those in more instances omitted, from this artistic Wall-hall, will probably raise a smile on the lips of the student of the history of art; but the work itself cannot fail to excite admiration, it is so elevated in style, treated with so much sobriety and refinement, and is so simple and effective in arrangement and execution. This great work employed the painter

during the years 1837-41. A very beautiful version of it (in which M. Delaroche had introduced some alterations) on canvas, of considerable size, but of course small in comparison with the original, formed the chief attraction at the French Exhibition, London, in 1854.

M. Delaroche is justly regarded by the French as one of their greatest painters. His pictures never reach the highest order of art. They are rather melodramatic than epic or tragic. They are suggestive always of a certain kind of stage effect. You see that the painter is aiming at the actor's trick—that he is seeking to 'make a point.' But allowing for this, it must be granted that M. Delaroche is almost all his countrymen pronounce him to be. He has undoubted genius, if it be not of the highest order; he is a master of his art; and he is always truthful, conscientious, correct in drawing, on the whole satisfactory as a colourist, and tells his story with admirable perspicuity.

M. Delaroche was named member of the Institute in 1832, and subsequently professor at the École des Beaux Arts, in which capacity he has educated a large number of pupils, several of whom have already obtained eminence. He was created an officer of the Legion of Honour in 1834.

DELAUVIGNE, JEAN-FRANÇOIS-CASIMIR, was the son of a merchant, and was born at Havre on the 4th of April 1793. He was educated at the Lyceum-Napoleon at Paris, and as early as his fourteenth year gave proofs of his addiction to poetry, confiding his attempts however only to his brother, and a fellow-student, Eugène Scribe, with whom his friendship continued to the close of his life. In 1811 he composed a poem on the birth of the son of Napoleon I. (the king of Rome as he was styled), which gained the approval of his tutor, and was presented to Napoleon on his visiting the Lyceum. It also procured him the patronage of the Count de Nantes, who gave him a situation in the excise-office, at which he attended only once a month, his patron advising him to pursue his poetical labours, and not waste his time at the office. While thus situated he published a poem on the death of Delille in 1813. In 1814 he tried for the prize given by the Académie Française with his 'Charles XII. at Narva,' an episode of a contemplated epic. He failed, but his poem received honourable mention. The next year he again competed for the prize with a poem upon the discovery of vaccination; he was not successful, but he was second. On the restoration of the Bourbons in 1815, he expressed his feelings in two poems, called 'Méséniennes,' in which he laments the misfortunes and flatters the vanity of his countrymen. They were at first circulated in manuscript, but they deserved and obtained popularity, for they contain many striking thoughts in poetical language, and when printed in 1824 they had an immense sale. There was in them considerable bitterness against the Bourbons, but Baron Pasquier, then minister of Louis XVIII., sent for the young poet, and appointed him librarian of the chancery, where there was no library. The appointment was very acceptable, as by the change of dynasty he had lost his place in the excise. He did not however change his political opinions, but, choosing for his next subject Joan of Arc, he made constant allusions in the two elegies on her life and death to the evils of a country being subjected to strangers, and to the glory of expelling them. He next turned his thoughts to the stage, and produced his 'Vêpres Siciliennes,' which, owing in a great degree to similar allusions to the recent events in France, had a great success when produced on the stage in 1819, though its dramatic merit is small, a florid diction scarcely supplying a weakness of characterisation and a paucity of poetic ideas. In 1820 he produced the comedy of 'Les Comédiens,' but with less success. These were followed by many others. As a dramatist he takes no high rank either in tragedy or comedy: of the first class perhaps his best work is the 'Louis XI.;' of the second, 'L'École des Vieillards;' but there is the like want of dramatic power and of capability of fixing character in all of them. Many of them however had much temporary popularity. In 1825 he was elected a member of the Academy, and notwithstanding his avowed political opinions, Charles X. offered him a pension of 1200 francs, which was firmly but courteously declined. On the occurrence of the revolution of July 1830, he wrote and published his song of 'La Parisienne,' which for a time rivalled the famous 'La Marseillaise.' He refused offers of employment however under Louis Philippe, but continued industriously, and, as far as profit was concerned, successfully his literary labours. At length his health began to decline, and on the 11th of December 1843 he died at Lyon, whither he had gone for change of air. After his death there was published a collection of poems, some new and some that had appeared at different times, under the title of 'Dernier Chants,' with a memoir by his brother. The poems are not of a character to increase his poetic reputation greatly; his best production continues to be the 'Méséniennes,' notwithstanding their faults, though some of the shorter pieces occasionally contain a happy thought happily expressed. Various editions of his complete works have been published, the first in 1845, in 8 vols. 8vo. A statue in bronze by David d'Angers has been placed in his native town of Havre.

DELFICO, MELCHIORRE, born of a noble family at Teramo, in the Abruzzo, August 1, 1744, studied at Naples under Genovesi, Mazzocchi, and other learned teachers, and applied himself particularly to the study of the law and of political economy. After his return to his native country he published his first work, an essay in defence

of matrimony, against some loose opinions of the time—'Saggio Filosofico nel Matrimonio,' 1774. In 1782 he published a treatise on the advantages of a provincial militia—'Discorso sul Ristabilimento della Milizia Provinciale.' He next wrote a 'Memoria nella Coltivazione del Riso Comune in Provincia di Teramo,' in which he recommended the removal of the unhealthy rice grounds from the neighbourhood of towns and villages, a suggestion which was approved of and acted upon by King Ferdinand. He also wrote several memoirs against the laws restrictive of the trade in provisions—'Memorie sul Tribunale della Grascia e sulle Leggi Economiche nelle Provincie confinanti del Regno.' These memoirs being addressed to the king, had also the effect of removing the obnoxious restrictions on the sale and exportation of rural produce. The government of Naples was at that time disposed to useful reforms, and much was done to improve the condition of the people, until the French revolution broke out, when the Italian governments became suspicious and averse to change. Previous to that however Delfico continued to assist by his suggestions the progress of social improvement. He wrote in 1787 a memoir against the abuse of the winter transmigration of sheep from the highlands to the maritime districts of the Abruzzo, by which a large tract of fertile land was kept out of cultivation, 'Memoranda i Regii Stucchi, ossia sulla Servitù dei Pascoli Invernali nelle Provincie Marittime degli Abruzzi,' and soon after he published another treatise on the like practice in the plain of Apulia—'Discorso sul Travoliere di Puglia,' 8vo, 1788. About the same time he wrote a 'Memoria su i pesi e le misure del Regno,' recommending a uniform system of weights and measures throughout the various provinces of the kingdom of Naples. His next work was in favour of the free sale of fiefs which reverted to the crown at the extinction of baronial families—'Riflessioni sulla Vendita dei Feudi,' 1790, and 'Lettera al Duca di Cantalupo su i feudi devoluti,' 1795. Here again his recommendation prevailed, and a law was issued for the sale of feudal estates reverted to the crown as allodial property.

Delfico also addressed to the king a 'Rimostranza,' or 'Memorial,' by which he obtained the establishment of a 'Regia Udienza,' or royal court of justice for the province of Teramo, which till then was dependent on the court of Chieti. King Ferdinand made Delfico a Knight of the Order of Constantine. In 1799 the French invaded the kingdom of Naples, and a few months after they were obliged to evacuate it. In the midst of those blood-stained vicissitudes, Delfico thought it prudent to emigrate, and he repaired to San Marino, where he was inscribed among the citizens of that republic, and where he waited for more peaceful times. In gratitude for the hospitality which he there met with, he wrote the history of that little state from the documents which he found in its archives—'Memorie storiche della repubblica di San Marino raccolte dal Cavaliere Melchiorre Delfico cittadino della medesima,' 4to, Milan, 1804. When Joseph Bonaparte became King of Naples in 1806, Delfico was made councillor of state, and was also for a time intrusted with the management of the home department. He contributed to the new judiciary organisation of the kingdom and other useful measures, among others to the establishment of the house for the insane at Aversa. On the restoration of King Ferdinand in 1815, Delfico was made President of the Commission of the Archives. In 1823 he tendered his resignation on account of his great age, and the king allowed him a handsome pension for life. He left Naples, and returned to his native Teramo, where he continued till his death, which occurred on the 21st of June 1835, at the age of ninety-one. A few years before his death, as the new king, the present Ferdinand II., being on a tour through the provinces, repaired to Teramo, in 1832, Delfico, who in his youth had known his great grandfather King Charles Bourbon, the founder of the Neapolitan dynasty, caused himself to be carried to the presence of his youthful king, who received him with marks of respect, had him seated by his side, and conversed long with him.

Besides the works mentioned in the course of this article, Delfico wrote the following:—1, 'Ricerche sul vero Carattere della Giurisprudenza Romana, e de suoi Cultori,' 8vo, 1791, a work that has been reprinted several times. 2, 'Pensieri su la Storia e su la Incertezza ed Inutilità della medesima,' 8vo, Forlì, 1806, also reprinted several times. These two works are worthy of notice for a certain boldness and originality of thought which sometimes assumes the form of paradox. The author speaks of the ancient Romans and their institutions and manners with great severity; he anticipates Niebuhr in his scepticism concerning the legend of the early ages of Rome, and he repeats the sentence of his countryman Vico, who said that the Roman people, until the second Punic war, knew no other arts but those of digging the ground and cutting the throats of their neighbours. It is worthy of remark, that Neapolitan philosophers and critics have shown less classical veneration for Rome than those of other parts of Italy, and have exhibited more of a Samnite than a Roman feeling in their historical investigations. 3, 'Dell' Antica Numismatica della Città di Atri nel Piceno con alcuni Opuscoli sulle Origini Italiane,' fol., Naples, 1826, a work of much antiquarian and historical erudition. 4, 'Memoria sulla Libertà del Commercio, diretta a risolvere il Problema proposto dall' Accademia di Padova sullo stesso Argomento,' inserted in the thirty-ninth volume of Custodi's great collection of the Italian economists. Delfico was an advocate of free trade. 5, 'Sugli Antichi Confini del Regno,' written for the

minister of the interior, but as yet inedited, like many other of his treatises and memoirs. 6, 'Espressioni della particolare Riconoscenza della Città e Provincia di Teramo dovuta alla Memoria di Ferdinando I.,' inserted in the second volume of the 'Annali Civili del Regno,' and being a recapitulation of all the improvements effected in that province under the reign of the elder Ferdinand, chiefly at the suggestion of Delile.

(Tipaldo, *Biografia degli Italiani Illustri*; Mozetti, *Degli Studii, delle Opere, e delle Virtù di Melchiorre Delile*, Teramo, 1835.)

DELILLE, JACQUES, was born at Aignes-Perse, in Auvergne, June 22, 1738, and educated at Paris at the Collège de Lisieux. Poverty compelled him to accept the office of subordinate teacher at the Collège de Beauvais; but he was soon raised to the rank of professor of humanity in the college of Amiens. While holding this office he commenced a translation of Virgil's Georgics. On his return to Paris he was appointed professor at the Collège de la Marche. He now began to be known as a poet, and several of his pieces attained celebrity, particularly an epistle to M. Laurent. But it was the publication of his Georgics, a work to which he was urged by Racine, that raised him to distinction. The public read this translation with enthusiasm, and thought that the French language was capable of representing all the beauties of antiquity. Envy notwithstanding appeared here and there; and old forgotten poets were dragged from oblivion, that their works might be lauded at the expense of M. Delille's reputation. In 1774 the author was elected a member of the Academy, and soon after published his celebrated poem, 'Les Jardins.' The popularity of this work does not seem to have been equal to that of the Georgics.

Delille accompanied M. de Choiseul Gouffier on his embassy to Constantinople, and took the opportunity of visiting Athens. It was on this tour that he composed his poem, 'L'Imagination.' On his return to Paris he became professor of Belles-lettres at the university and of Latin poetry at the Collège de France. By the Comte d'Artois he had been presented with the abbacy of A. Séverin, and thus placed in affluent circumstances. He was unfortunate enough to lose all his property by the Revolution. At the celebration of the Fête de l'Être Suprême, which took place during the Reign of Terror, Robespierre demanded of Delille an ode for the occasion. The poet, finding refusal was of no use, astonished Robespierre by writing a dithyrambic poem on the immortality of the soul, wherein he warmly supported that doctrine. The troubles of the capital induced him, in 1794, to leave Paris for St. Diez, and subsequently to retire to Switzerland, where the government of Berne made him a citizen. Here he finished his 'Homme des Champs' and 'Les Trois Règnes de la Nature.' He afterwards visited London, where he translated Milton's 'Paradise Lost.' In 1801 he returned to Paris, was treated with marked attention by Bonaparte, but he declined to re-enter the great world, and lived in modest retirement at the Collège de France. The last two years of his life were spent at Nanterre. He died at Paris, universally regretted, on the 1st of May 1813.

Delille is one of those poets who will always be honoured by posterity; he is regarded as a reformer of the language; and he wrote verse with an ease and elegance before unknown. Those who feel pleasure in hearing the Alexandrine verse must be pleased (as far as structure goes) with the didactic poems of Delille. Nothing can be conceived more smooth and easy than the flowing of his lines; and even when he writes in a measure more irregular, as in 'La Conversation,' the same correctness is so carefully attended to, that a person of the slightest ear may read him aloud without once hesitating as to the place where the caesura lies. To say he was a poet of great imagination would be going too far; but he is entitled to higher praise than that of a mere verse-maker. His images, as well as his lines, are often exceedingly elegant. His 'Conversation' is an amusing poem; it is a Theophrastus in verse, portraying the different sorts of persons who figure in conversation. It has however the fault of most works that treat of characteristics—the persons who appear in it are personified abstractions, instead of individuals as they appear in nature.

DELISLE, WILLIAM, a French geographer of great celebrity in his own day, was born at Paris in 1675. His inclination for the pursuit in which he afterwards became so eminent, was displayed at an early age, and he made considerable proficiency in the art of constructing maps before he was nine years old. This taste was induced and carefully cultivated by his father, who appears to have been also much devoted to geographical and astronomical pursuits. In 1699 he published a map of the world, which, with other maps and dissertations on geography, led to his election as a member of the Academy of Sciences in 1702; and soon afterwards he was appointed geographer to the king, with a pension. Indeed several of his works were written for the use of his royal pupil, in the course of instruction which he condescended to receive from Delisle.

Delisle's celebrity was not only so great in his own country that no work of history or travel was considered complete without his maps, but it extended all over Europe. He had several flattering invitations from the monarchs of other countries to remove to their capitals; and Peter the Great paid him a personal visit at Paris, to attempt to induce him to go to Russia. All these offers he rejected, but he gave Peter an excellent series of maps of his immense dominions. Fonte-

nelle, in his 'Eloge,' says that the geographer knew their limits better than their owner did himself; and it was probably the respect entertained for him by the Czar that led to his brother Joseph being appointed to take charge of the observatory at St. Petersburg, with a very considerable salary.

In 1726, Delisle died of apoplexy, aged fifty-one. The most valuable of his writings may be seen in the Memoirs of the French Academy; but any list of them is unnecessary here.

DELISLE, JOSEPH NICOLAS, a younger brother of the preceding geographer, was trained in the same school, and became very eminent in the same pursuits. He was born in 1688.

His published labours commenced with an excellent observation of the great total eclipse of the sun in 1706, when he was only eighteen years of age; and in 1714 he was admitted a member of the Academy, in the section of astronomy. In 1724 he visited England, and at the recommendation of Newton and Halley, by both of whom he was greatly esteemed, he was elected a Fellow of the Royal Society, on the foreign list. In 1726, the year in which his brother died, he was appointed astronomer to the Czar Peter, a situation which he retained twenty-one years, when he returned to Paris on account of his health. He was then appointed professor of astronomy in the Royal College of France, which he held many years. Amongst his pupils were Lalande and Messier.

He died in 1768, at the age of eighty; having published, besides his 'History of Astronomy' (2 vols. 4to, 1738), no less than 44 papers in the 'Memoirs of the Academy,' and several other dissertations elsewhere.

DELORME, JOHN LOUIS, was born at Geneva in 1740. He was an advocate in his native town, when the political dissension which occurred there, and in which he took a part by the publication of his 'Examen de Trois Parts des Droits,' forced him to leave his country, and take refuge in England. Here, notwithstanding his literary activity, he passed some years in great indigence; so that at length, though his pride long withheld him from seeking or receiving any such assistance, he was forced to accept pecuniary aid about 1775 from a society for the relief of distressed authors. This however was only taken to enable him to return to his native land, and he died at a village in Switzerland in 1806.

Delorme's principal work was that on the 'Constitution of England,' which was originally written in French, and published at Amsterdam in 1771, but afterwards translated by himself into English, and published in London in 1772. It was subsequently enlarged, and has been frequently reprinted. It is a shallow book, of little authority now, but it was popular for awhile as being one of the first written by a foreigner on the subject, explaining some of the peculiarities and excellences of the British constitution as compared with other countries, and as accounting for the prosperity of the people and the strength of the country. His other works were—'Parallel between the English Government and the former Government of Sweden,' London, 1772; 'History of the Flagellants, or Memorials of Human Superstition,' 1782; and 'Essays, containing Strictures on the Union of Scotland with England.'

DELORME, PHILIBERT, was born in 1518 at Lyon, where his father was a builder or undertaker of public works, in extensive practice. As he himself boasts, he was hardly fifteen when he had upwards of three hundred workmen to receive their directions from him; which probably means that such directions were only transmitted through him. In 1533 he was sent to Rome, where in a short time he secured a protector in the Cardinal Santa Croce, who took him into his household. The devoutness which he now affected far exceeded his application to study, which did not extend to more than making ordinary sketches. Yet if he did not profit much by diligence, he made what was then considered an important discovery, namely, that of the mode practised by the ancients for tracing the Ionic volute, as described on a capital in Santa Maria Traastevere—a discovery subsequently claimed for Palladio, although Delorme's prior right to it is neither to be disputed nor suspected, because the other did not visit Rome till 1549, nor begin to publish any of his writings till 1570, whereas the first edition of Delorme's works appeared in 1567.

On his return to his native city in 1536, Delorme, who brought back with him a high character for religious strictness, was employed to erect the portal of the church of St. Nizier, which, as far as it was ever finished, gives no very favourable idea of his architectural talent. The alterations of the Hôtel Billau, in the same city, obtained for him much more credit; but nearly the whole of it was due to his brother Jean. That work completed, he was soon afterwards summoned to Paris by Catherine de' Medici, to whom he had been recommended by the Cardinal du Bellay, who had himself been charged by Santa Croce (raised to the papal see in 1555 by the title of Marcellus II., but who wore the tiara only three-and-twenty days) to promote the advancement of his protégé. Catherine perceived in him other merits than those of a mere artist, and rewarded them accordingly. Although he was not in orders, having only received the tonsure when at Rome, several church benefices were conferred upon him, and he was appointed Amônier du Roi. No wonder therefore, when rewards of that kind were showered upon him so unscrupulously, that he should have obtained much of the most important and lucrative employment in his own profession, without his qualifications being narrowly

inquired into. Delorme was associated with Primaticcio in the erection of the monument of Francis I., and that of the Valois princes at St. Denys (taken down in 1719), but the designs were made by Primaticcio. Among works of a more strictly architectural nature, he built the Château de Meudon for the Cardinal de Lorraine, and completed the Château de Madrid in the Bois de Boulogne at Paris; but his work at the latter building was inferior to that of his predecessors. To these may be added—the Court (en fer de cheval) at Fontainebleau; the royal seats of Villers-Cotterêts, de la Muette, and St. Germain-en-Laye; and the celebrated Château d'Anet, built for the Duchess de Valentinois, better known as Diane de Poitiers. Of these buildings, such as remain at all have been so altered at different times that their original character is nearly effaced; but of the Château d'Anet the portal, or lofty centre compartment, is preserved by having been taken down and re-erected as a restoration in the court of the École des Beaux Arts at Paris. The reputation however obtained by that monument for Philibert is, Callet assures us, in reality due to Jean Delorme, his brother. On the death of Henri II. (1559) he not only lost his appointment of Royal Architect, but fell into disgrace with the new king Francis II. Nevertheless the queen-mother continued her protection, and he was accordingly intrusted by her with the works of her new palace of the Tuileries (1564); but it is far from certain whether Delorme or Bullant, who was also engaged upon the Tuileries, had the greater share in the original structure. According to Callet, it was Bullant who was the author of the general design of the palace; for Delorme, in the dedication of his works to Catherine (1567), takes credit to himself only for the 'Ionic order' and some other minor parts, but carefully avoids mentioning the name of the other architect. What Delorme's talent and taste really were, may perhaps be pretty well judged of by a specimen which no one will envy him the credit of, namely, the house which he erected for himself in the Rue de la Cirisaie, and of which Callet exhibits two elevations and a ground-plan; for it is of studied inconsequence as a dwelling, and very far from handsome as a design. It was there that Philibert died, May 30, 1577, at the age of fifty-nine. He wrote a work entitled '*Nouvelles Inventions pour bien bâtir à petit frais*', Paris, 1551, which contains much useful practical information in regard to the carpentry of roofs and domes.

Of his brother, JEAN DELORME, no particulars have come down to us—a circumstance that is accounted for by the fact that Philibert took care that he should be considered as a mere subordinate. The probability is, that Jean died some time before his brother.

(Callet, *Notice Historique sur quelques Architectes Français du seizième Siècle*, Paris, 1843.)

DELUO, JEAN ANDRÉ, was born at Geneva in 1727. His father, François Deluc, was a watch manufacturer, not only skilful in his trade, but conversant with other branches of knowledge, and a writer upon religious and political matters. His son also took part in the disputes between the négatifs and the représentans, or aristocratic and democratic parties, of his native republic, to the latter of which he belonged; and he was sent, in 1768, by his fellow-representatives to Paris to plead their cause with the Duke of Choiseul, the prime minister in France. On his return in 1770 he was made a member of the legislative council; but not long afterwards he left Geneva and its politics for England, to devote himself entirely to scientific pursuits. He had from an early age applied himself to the study of geology, and had made excursions into the Alps, while his brother investigated the mountains of Italy for the same object. His own words best explain his purpose: "My brother and I entered together upon our geological career while I yet lived at Geneva, and after a certain period we came to a first conclusion, which from that time has been our guide, namely, that an essential distinction was to be made among the various phenomena which the surface of the earth exhibits, with respect to their causes, by determining as to each of them whether the causes which have produced it are still in action, or have, at some epoch, ceased to act. . . . Continuing our observations, we came at length to a conviction that the formation of our continents, with regard both to their composition and general form, as well as their existence above the level of the sea, should be ascribed to causes no longer in action on our globe, and that the whole of the effects of the still-existing causes have been limited to a modification of that original state. After having quitted Geneva, I continued my observations in various countries, and more particularly on the sea coast; my brother likewise pursued his, and we communicated our remarks to each other. I saw the possibility of determining, by the action of actual causes, what had been the state of our continents at their birth, and also the possibility of determining the time elapsed since that period. I then wrote my first geological work, '*Lettres Physiques et Morales sur l'Histoire de la Terre et de l'Homme*,' 8vo, La Haye, 1778." These letters were addressed to Queen Charlotte, consort of George III., who appointed Deluc her reader. They relate only to the Alps of Switzerland; but in the following year appeared a continuation of the work, under the same title, including Deluc's travels through Rhenish Germany, Hanover, Friesland, Holland, Belgium, &c., in 5 thick vols. 8vo. These letters are not merely scientific treatises; they are also descriptive of scenery, of the inhabitants, and their manners; they contain statistical and moral observations, and many of them are full of interest even to the general reader. One great

conclusion which Deluc came to from all his observations was, that the present continents were left dry by a great and sudden revolution of comparatively recent occurrence, not more than four or five thousand years since, which revolution buried under the sea the countries previously inhabited. This opinion has been also maintained by Saussure, Dolomieu, and for awhile by Cuvier. Deluc agreed with Saussure in considering that the materials which form our mountains were first deposited in horizontal and continuous strata, and that their present broken and dislocated state is the effect of subsequent catastrophes, which however were previous to that which left them dry. Deluc's whole system concerning the various epochs of the creation corresponding to the six days, or rather periods, of Genesis, appears in several of his numerous works, and especially in his '*Lettres Géologiques sur l'Histoire de la Terre*,' addressed to Blumenbach, 1798; in his '*Traité Élémentaire de Géologie*,' 1808, which was also published in English; and in his '*Geological Travels in the North of Europe and in England*,' 3 vols. 8vo, London, 1810. Deluc made also many observations on the atmosphere, and the phenomena of air, heat, and light. He wrote '*Recherches sur les Modifications de l'Atmosphère, contenant l'Histoire critique du Baromètre et du Thermomètre, un traité sur la construction de ces instruments, des expériences relatives à leurs usages, et principalement à la mesure des hauteurs, et à la correction des réfractions moyennes; avec figures*,' 2 vols. 4to, Geneva, 1772. It is perhaps in this branch of experimental philosophy that Deluc rendered the most positive services to science. He made great improvements in the barometer, especially as applied to the measurement of heights. He also wrote '*Mémoire sur un Hygromètre comparable présenté à la Société Royale de Londres*.' Among his other works may be mentioned, '*Idées sur la Météorologie*,' 1786; '*Introduction à la Physique Terrestre par les Fluides expansibles*,' 1803; '*Traité Élémentaire sur le Fluide Electro-Galvanique*,' 1804.

Deluc's earnestness in availing himself of his geological observations to prove the veracity of the Mosaic narrative involved him in controversial correspondence with several of his contemporaries, and particularly with Dr. Teller of Berlin: '*Lettres sur le Christianisme*, adressées au Dr. Teller,' 1801; '*Correspondance particulière entre le Docteur Teller et J. A. Deluc*,' in French and German, 1803-4; and also with Professor Reimarus of Hamburg, '*Annonces d'un Ouvrage de M. J. A. Reimarus sur la Formation du Globe*, par J. A. Deluc,' Hanover, 1803. But though Deluc was earnest in his religious conviction, and in supporting it by arguments, his spirit was far from being intolerant, as he shows in numerous passages of his works, and especially in his '*Discours sur la Tolérance*,' in the first volume of the '*Histoire de la Terre et de l'Homme*.' He was a great admirer of Bacon, and wrote '*Précis de la Philosophie de Bacon, et des Progrès qu'ont fait les Sciences Naturelles par ses Préceptes et son Exemple*,' 2 vols. 8vo, Paris, 1802. He wrote also on education: '*Lettres sur l'Éducation Religieuse de l'Enfance, précédées et suivies de détails historiques*,' 8vo, 1799; besides many other memoirs, treatises, &c., which appeared in the '*Journal des Savans*,' '*Transactions Philosophiques*, and other scientific journals, French, English, and German. He was a member of the Royal Societies of London, Dublin, and Göttingen, and correspondent of the academies of Paris, Montpellier, &c. He was appointed in 1798 professor of philosophy and geology in the University of Göttingen. He passed several years in Germany, at Berlin, Hanover, Brunswick, &c. After the battle of Jena he returned to England, where he passed the remainder of his life, chiefly at Windsor, where his situation of reader to the queen gave him a free access to the royal family, by the members of which he was much respected. He died at Windsor, November 1817, in his ninety-first year. His brother and fellow-observer, Guillaume Antoine Deluc, died at Geneva in 1812, and left a rich collection of mineralogy, which was increased by his son André Deluc, who wrote an '*Histoire du Passage des Alpes par Annibal*,' Geneva, 1818.

DEMADES, an Athenian orator and demagogue, contemporary with Demosthenes. According to Suidas he was originally a sailor; according to Proclus a fishmonger. He took the part of Philip in the Olynthian affair, and was liberally rewarded by that prince, who received him well when he fell into his hands after the battle of Cheronea. He was mainly instrumental in bringing about the peace between Macedon and Athens, which followed that victory. (Demosth., 'de Corona,' p. 320.) When Alexander, in B.C. 335, demanded that the Athenian orators who were opposed to him should be delivered into his hands, Demades induced him to relinquish his claim. (Diod., xvii. 15; Plut., 'Dem.' c. xxiii.) Demades seems to have yielded to the bribery of Harpalus. (Dinarch., c.; Demosth., p. 101.) It appears that he was concerned with Phocion in delivering up Athens to Antipater. (Corn. Nepos. 'Phoc. II.'). In B.C. 318 he went on an embassy to Antipater to induce him to remove the garrison from Munychia, and took his son Demeas with him. Unfortunately, a letter which he had written to Perdicas fell into the hands of Cassander, and in revenge for the offensive terms in which Antipater was alluded to in it, that prince put to death the orator and his son. Cicero ('Brut.' 9) and Quintilian (ii. 17, § 18; xii. 10, § 49) assert that he did not write anything; but a fragment of his speech in defence of his twelve years' administration (*ὁμιλία τῆς δεκαετίας*) is still extant, and Suidas attributes to him a history of Delos, and of the birth of the children

of Latona. Pytheas ('in Athen.,' p. 44 F) describes him as a profligate drunken fellow. He was a great wit, and many of his sallies are recorded.

DEMETRIUS PHALEREUS, an Athenian, the son of Phanostratus, and a scholar of Theophrastus. His earlier years were devoted to the study of philosophy: he first began to take a part in public affairs about B.C. 320. (Diog. Laert., v. 5-75.) He was condemned to death at the same time with Phocion (B.C. 317) for espousing the Macedonian party, but had the good fortune to escape by flight (Plut., 'Phoc.' cxxxv.), and was shortly after made governor of Athens by Cassander. He maintained his authority for ten years, and, according to Strabo (p. 398), Athens was never more happy than under his government. In his administration of affairs he was so popular that 360 statues were erected in his honour; but when Demetrius Poliorcetes came to Athens (B.C. 307) and proclaimed the old democracy, he was obliged to fly a second time, and would hardly have escaped had not his enemy ensured him a safe retreat to Thebes. (Diodor. Sic. xx., 45, 46.) After the death of Cassander (B.C. 296) Demetrius retired to the court of Ptolemy Soter, king of Egypt, where he was received with great distinction, and where he probably wrote most of the numerous works attributed to him by Diogenes. (v. 5-80.) Unfortunately however he made an unsuccessful attempt to dissuade his patron from altering the succession to his crown in favour of his children by Berenice. When Ptolemy Philadelphus came to the throne in B.C. 283 he had not forgotten the counsel which would, had it been listened to, have deprived him of his father's preference, and banished the author of it to Busiris, where he soon after died from the bite of an asp. A treatise on rhetoric, ascribed to him, has come down to us, and has been edited separately by Schneider, Altenburg, 1779.

DEMETRIUS POLIORCETES (the city-taker) was the son of Antigonus (one of the successors of Alexander the Great) and Stratonice. He appears to have been born about the year B.C. 334, for Plutarch tells us ('Dem.,' v.) he was twenty-two when he was defeated by Ptolemy and Seleucus at Gaza (B.C. 312). Demetrius soon obliterated the disgrace which had attended his first feat of arms by a brilliant victory which he gained over Cillex, one of the generals of Ptolemy. (Plut., 'Dem.,' vi.) In the division of Alexander's empire, which shortly followed, it was determined that Greece should be freed from the dominion of Cassander, and this duty Demetrius willingly took upon himself. Demetrius Phalereus then governed Athens as

Cassander's deputy, and had obtained great popularity; but when Demetrius Poliorcetes took Munychia and offered a democratical form of government to the Athenians (B.C. 307), the disciple of Theophrastus was glad to owe a safe retreat to Thebes to the generosity of his namesake. In the following year Demetrius gained a great naval victory over Ptolemy, and conquered the isle of Cyprus, in consequence of which his father Antigonus assumed the title of king. (Plut., 'Dem.,' xvii., xviii.) In B.C. 304 Demetrius laid siege to Rhodes, but, although he showed all the resources of his genius in inventing new and extraordinary machines for taking the city, he was unable to make himself master of it, and, after a year's siege, he formed an alliance with the Rhodians against all persons, with the exception of Ptolemy. (Plut., 'Dem.,' xxi.) Demetrius then returned to Greece, forced Cassander to raise the siege of Athens, and pursued him to Thermopylae: after this he took Sicyon by surprise, and then Corinth and Argos, where he married Deidamia, sister of Pyrrhus, king of Epirus. Cassander was willing to make peace, but Antigonus showed so little moderation that the other successors of Alexander were induced, through fear of the consequences of his ambition, to form a coalition against him. Antigonus met his enemies at Ipsus, in Phrygia, and fell in the battle. (Diod. xxi.; Plut., 'Dem.,' xxviii.—xxx.) Demetrius escaped from the defeat with 9000 men to Ephesus, whence he passed over to the Cyclades, and, being excluded from Athens, sailed for the Chersonese. While he was there engaged in laying waste the lands of Lysimachus, Seleucus sent to him to demand his daughter Stratonice in marriage, a proposal to which he readily agreed. Having made himself master of the surrounding country, he laid siege to Athens, which was under the dominion of the tyrant Lachares. The city soon surrendered (B.C. 295), and was treated with great kindness by the conqueror. (Plut., 'Dem.,' xxxiv.) The quarrel of Alexander and Antipater, the two sons of Cassander, gave him an opportunity of getting possession of Macedon, which he easily accomplished after having put to death Alexander, who had called him in to

assist him against his brother. (B.C. 294.) Although master of the greater part of Greece, he was eager to get possession of the whole, and attacked and took Thebes. But his popularity was now on the wane, and he was easily driven from the throne of Macedon by Pyrrhus the Epirote, in B.C. 287, whose good qualities had become known to the subjects of Demetrius. (Plut., 'Dem.,' xlv.) Shortly afterwards he fell into the hands of Seleucus, whose kingdom he had invaded, and was detained by him in honourable confinement till his death in B.C. 283. This celebrated man was so eminently handsome in his person that sculptors and painters always fell short of his beauty. He was much given to debauchery, and is said to have shortened his life by his excesses.

DEMETRIUS SOTER, king of Syria, the son of Seleucus Philopater, passed his youth at Rome as a hostage. He effected his escape, partly through the assistance afforded him by the historian Polybius, and mounted the throne of his ancestors about B.C. 161. He contended in vain with the Maccabees, who then ruled over Judaea, and died valiantly fighting against Alexander Balas about B.C. 150.

Coin of Demetrius Soter.

DEMETRIUS NICA'TOR was the son of Soter. Having been sent to Cnidos, towards the end of his father's reign, he did not fall into the hands of the successful usurper Bala, and with the assistance of the king of Egypt, whose daughter Cleopatra he had married, soon possessed himself of his father's throne. As however he gave himself up, after awhile, to profligacy, luxury, and indolence, and did not attend to the duties of his station, his numerous enemies contrived to expel him from his kingdom, and he remained for some time in the hands of the Parthians, upon whom he had ventured to make war. While still in captivity he married a daughter of Mithridates, the Parthian king; and his former wife Cleopatra formed a union with his brother Antiochus, who became king of Syria in his absence, and fell in battle with the Parthians. Phraates, before this event happened, had released Demetrius, in order that he might divide his brother's party, and he consequently regained his kingdom after the death of Antiochus. But Demetrius governed Syria no better than before his captivity. He was again expelled by another usurper, and was assassinated by the orders of his wife Cleopatra in a temple at Tyre, where he had taken refuge, B.C. 126.

DEMETRIUS, Tsar (Czar) of Russia, the title assumed by a succession of claimants at the commencement of the 17th century, the first of whom is generally spoken of in history as the 'False Demetrius.' Ivan the Fourth of Russia, known as 'the Terrible,' in the year 1584 killed, in one of his customary fits of fury, his eldest son, and died in the same year, partly, it is said, from remorse. Though he had had seven wives he left but two sons, Theodore, or Feodor, who succeeded him, and a child named Demetrius, only three years old; and these were the sole descendants of the race of Rurik, which had occupied the Russian throne for centuries. Feodor, who was a weak sovereign, was entirely governed by his brother-in-law, Boris Godunov, who sent the young prince Demetrius, with his mother, away from the court of Moscow to the town of Uglich. In the year 1591, when Demetrius was ten years old, he was seized with an epileptic fit (to which he was subject), when playing in the courtyard with his knife, fell so that the knife entered his throat, and died immediately; his mother, who ran to the spot, alarmed by the cries of the spectators, called out, in the first anguish of her despair, that he was murdered, and the populace of Uglich, incited by her brothers, the uncles of Demetrius, seized on some of the household and put them

to death as accomplices in his assassination. These are the statements which appear on the evidence of numerous witnesses in an inquiry instituted at the time, nominally under the authority of the Tsar, but in reality under that of Godunov, which terminated in the banishment of the uncles of Demetrius, in his mother being compelled to take the veil, and in the ruin of the town of Uglich, the inhabitants of which were sent in a body to Siberia, then a newly-acquired possession of the Russian crown. For seven years afterwards the reign of Feodor continued, and in 1598, when the dynasty of the line of Rurik closed with his death, Boris Godunov, who had long been regent, assumed the title of Tsar. By some harsh and singular measures, in particular by that of making drunkenness a capital crime, Boris rendered his name unpopular, and was generally looked on as a tyrant. In 1603 the public mind was suddenly stirred by the rumour that Demetrius was alive, and had shown himself in Poland. Several versions are to be found in the historians of the time of the way in which the revelation was first made: that adopted by Kavaulin, the modern historian of Russia, is that a stranger who fell seriously ill in a Polish town, sent for a confessor and imparted to him that he was the heir of the Russian throne, and the confessor communicated the event to Prince Adam Wisniowiecki, and that on the stranger's recovery the prince made known his claims, and espoused his cause. It is certain that, in 1603, the Prince Constantine Wisniowiecki, brother of Adam, introduced to his father-in-law Mniszek, the Palatine of Sandomir, a young man who asserted himself to be Demetrius, who gave out that, when in his tenth year, assassins had been sent by Godunov to dispatch him, in order to clear the usurper's way to the throne; that another boy had been substituted in his place, killed and buried as the son of Ivan, and that he, the real Demetrius, had been secretly brought up in a convent till he had grown to the age of a man, and was capable of asserting his rights. A Russian, named Petrovski, who saw him when with Wisniowiecki, declared that he had known the young Prince Demetrius well, and that he recognised the stranger as the same person by two warts—one on his forehead, the other under his right eye, and by one of the arms being a little longer than the other. The Palatine of Sandomir received the stranger as Demetrius, and presented him to the king of Poland, Sigismund the Third, who, at a solemn audience, after hearing a statement of his birth and his misfortunes, replied: "God preserve thee, Demetrius, prince of Muscovy, thy birth is known to us, and attested by satisfactory evidence; we assign thee a pension of forty thousand florins, and, as our friend and our guest, we permit thee to accept the counsels and services of our subjects."

In May 1604 Demetrius signed a promise of marriage to Marina Mniszek, the daughter of the Palatine, in which he engaged to confer on her the towns of Novgorod and Pakov as a wedding-gift, and to pay her father a million of Polish florins (about 160,000*l.*) as soon as he should have ascended his throne. In June he signed another document, by which he engaged to cede the province of Severia to the Palatine and the king of Poland, and in the same month he privately abjured the Greek faith, and was admitted as a Roman Catholic in the palace of the nuncio. By these acts he secured the services of a little Polish army, with which he invaded Russia towards the close of 1604. Boris, who was of course by this time well aware of the proceedings of his opponent, stigmatised him as an impostor, affirming that he was a renegade monk of the name of Otrepiev, whom an accidental personal resemblance to Demetrius had led into the idea of counterfeiting the deceased prince. Modern historians who have had the advantage of being able to compare all the circumstances (many of them too minute to be mentioned here), are generally of opinion that the alleged Demetrius was neither what he pretended to be, nor what Boris asserted, leaving it still a matter of mystery who he was and whence he sprung. His campaign in Russia was a mixture of successes and reverses. He won a battle before Novgorod which was bravely defended by Basmanov, the best captain in Boris's service, and lost a battle at Dobruinicki, after which he retreated to Putivl, where the face of affairs was changed by the sudden death of Boris in April 1605. The Russian populace ascribed the unexpected event to the remorse of the Tsar, which it was believed had induced him to take poison, and Basmanov, the most formidable opponent of the invader, suddenly declared for Demetrius. The commander of the Russian army threw himself at his feet at Putivl and conducted him in triumph to Moscow, which he entered early in June, and was received with shouts of welcome by the people, now thoroughly convinced that he was the real Demetrius. A great test however was now approaching. The mother of Demetrius who had been sent by Boris to a convent after the massacre of Uglich was of course released by the triumph of her supposed son, and took her way towards Moscow. The Tsar met her at the village of Toininsk before she entered the capital, and it was so arranged that the first interview took place in a tent with no one to witness their emotions. In a few minutes they emerged from the tent and embraced with signs of warm affection, and at the signs the multitude burst into acclamations of joy, the last faint suspicions of doubters being now dissolved. A few days after Demetrius was crowned with great pomp at the cathedral, and he now, with Basmanov for his chief councillor, managed with a firm hand the reins of government. His subjects soon began to perceive with uneasiness that their new master

was infected with foreign notions, that he surrounded himself with foreign guards, that he laughed at many of their customs, and gave the preference on all occasions to the now triumphant and insolent Poles. Active, vigorous, and courageous, he was also generous to an imprudent degree, which he showed by pardoning the Prince Shuisky, who had been detected in a conspiracy against him. Meanwhile his engagements to the Poles weighed heavily upon him, not however that which pledged him to his Tsarina, Marina Mniszek, to whom he appears to have had a real attachment. The nuptial journey of Marina from Kracow to Moscow was magnificent; it lasted three months, and on the 12th of May 1606 she made her entry into the Russian capital. That marriage was Demetrius's destruction. The insolence of the Poles who accompanied her, the disregard which Demetrius on various occasions, and on that of his marriage in particular, showed for the rites of the Russian church, roused the indignation of the Russians whose discontent was exasperated by Shuisky, who was convinced of the falsehood of Demetrius's story and of his antagonism to the Russian church. Shuisky told a body of Russians assembled at his palace on May 28th, that their hostility to the impostor was discovered, and that either they or the Tsar must perish, and gave the signal for revolt. Once begun it spread like wildfire, the pent-up enmity of the populace against the foreigners swept all before it, amid cries of "Death to the heretic." The great bell of Moscow was tolled, and 3000 bells answered to the sound. Demetrius, who heard the alarm bell, sent to Shuisky's brother who was on duty at the Kremlin to inquire the cause, and was told it was a fire, but Basmanov soon appeared with the information that it was a revolt. Basmanov fell in his defence. Demetrius, pursued from room to room by the infuriated populace, leaped from a window thirty feet high, broke his leg, and was put to death by the mob, protesting at the last moment that he was "the Tsar—the son of Ivan." A frightful massacre followed.

The vacant throne was ascended by Prince Shuisky, who afterwards found an unexpected opponent. In spite of a declaration which he caused to be issued by the widow of Ivan, to the effect that the slain Tsar was an impostor, that he was really the monk Otrepiev, and that she had only acknowledged him for her son from fear of his vengeance if she had denied him, a notion gained ground not only that he was the genuine Demetrius, but that he was still alive. A person who is known to the Russian historians as 'the second False Demetrius,' or 'the Robber of Tushino' (the latter appellation derived from his having established his camp at Tushino, a village near Moscow), asserted that he was the Tsar Demetrius, and that another had been slain for him in the massacre at Moscow, as formerly in the assassination at Uglich. One of his bands took prisoner Marina Mniszek and her father the Palatine, as they were being escorted homeward by a troop of Polish cavaliers; and Marina was required to declare if the pretender was not her husband, as the Tsarina had been required to declare if the pretender was not her son. Marina also gave an answer in the affirmative, and the anarchy into which Russia had fallen was for years prolonged by this bandit, who on one occasion besieged Moscow for seventeen months, and seemed on the point of making himself master. He was killed in 1610 by a Tartar chieftain, whom he had offended; and Marina ended her days in prison. Meanwhile the Poles and Swedes had invaded Russia. Shuisky, defeated by the Poles at the battle of Kluchino, was compelled by his nobles to resign the crown; and an arrangement was made that Ladislaus, the son of Sigismund III., should ascend the throne of the Tsars. The Poles were driven out in 1612 by the insurrection of Minin and Pozharski, and the long period of confusion was terminated by the election to the throne of a boy of sixteen, Michael, the founder of the present reigning house of Romanov.

Even the second false Demetrius was not the last of the pretenders; and there was a false son of the Tsar Feodor who set up claims to the throne; but none of them obtained the success of the earlier claimants. The story of the false Demetriuses has been a favourite one with dramatists and novelists; the best novel on the subject is that by Bulgarin, and the best plays are the 'Boris Godunov' of Pushkin, and the unfinished 'False Demetrius' of Schiller. The best historical monograph on the subject is that by Prosper Mérimée, 'Demetrius the Impostor,' translated into English by A. R. Scoble, London, 1853; but, unfortunately, M. Mérimée had never seen the most vivid narrative of the termination of the first Demetrius's career, 'The Report of a blonde and terrible massacre in the city of Mosco' (London, 1607, 4to), which was reprinted a few years ago by Mr. Asher of Berlin, from the copy in the British Museum. Ustrilov, the Russian historian, published in 1837 a collection of translations of the contemporary accounts of Demetrius, which extended to 5 vols. 8vo.

* DEMIDOV, or DEMIDOFF, ANATOL, a Russian author of some eminence, is the most conspicuous living member of a family of capitalists which occupies a position in Russia similar to that of the Barings and Rothschilds elsewhere, and which is also celebrated for the useful and benevolent purposes to which its vast wealth has been applied. The founder of the family was Niteita, a serf of the government of Tula in the time of Peter the Great, who left his native village to avoid being taken as a recruit, and afterwards became noted for his skill in the manufacture of arms, who originally

bound himself to a blacksmith at Tula to work at a rate equal to about three halfpence a week; and who, before the close of his career, when presents were made to the empress on the birth of Prince Peter, made her a present of a hundred thousand rubles. He was a favourite with Peter the Great, under whose auspices he established the first iron-foundry in Siberia. His son Akinfi, and his grandson Nikita, discovered the silver- and gold-mines in the Ural Mountains, which they kept concealed till they had ascertained that the government would allow the proprietors of the land to work them to their own profit. For some time the family has been fruitful in members who have distinguished themselves by their liberality in the interests of literature. Paul Demidov, who died at St. Petersburg in 1826, made a gift to the University of Moscow of a valuable museum of natural history, and founded the Demidov Lyceum at Yaroslavl. Nikolay Nikitich Demidov, who had raised a regiment at his own expense in 1812, and led it in person against the French, afterwards spent some years in France, and died at Florence in 1828, leaving two sons, Paul and Anatol. Paul, who died not long after, leaving the bulk of his immense property to his brother, founded a prize of 5000 rubles a year, to be given to the author who, in the judgment of the Academy of Sciences, had enriched Russian literature with the most important and useful work. His brother Anatol has taken the French language as the medium of his contributions to literature. His most important work is that which bears the title of 'Travels in Southern Russia and the Crimea, through Hungary, Wallachia, and Moldavia, during the year 1837,' which was printed at Paris in 1839, and of which an English translation appeared at London in 2 vols. 8vo in 1853. In these volumes, which appear to be partly the production of other writers, who travelled in M. Demidov's company at his expense, may be found the best account that has yet appeared of Sebastopol, Kertch, and Eupatoria. In 1840, Anatol Demidov was married at Florence to the Princess Matilda de Montfort, daughter of Prince Jerome Bonaparte and of Princess Catharine of Würtemberg. Much indignation was excited in Russia by the discovery that in the contract of marriage it had been agreed, in accordance with the present claims of the Roman Catholic Church, that all the children should be educated in the Roman Catholic faith, and Demidov had to repair to St. Petersburg to justify himself to the Emperor Nicholas, who in the first movement of indignation had struck him off the list of his chamberlains. The marriage produced no children, and after five years it was dissolved by mutual consent, the Emperor Nicholas, who happened at the time to be in Italy, fixing, it is said, the allowance for the princess at 200,000 rubles a year. M. Demidov is still for the most part resident in Italy; but he also frequently resides at Spa, where, we observe, that on the 19th of June 1856, there was a festival to celebrate the inauguration of a bust of Peter the Great, which he presented to the town. The princess takes a conspicuous part at the court of Louis Napoleon at Paris.

DEMOCRITUS was born at Abdera in Thrace, or, according to some, as we learn from Diogenes Laertius (ix. 34), at Miletus, in the year B.C. 460. He was thus forty years younger than Anaxagoras, and eight years younger than Socrates. He received his first lessons in astrology and theology from some Magi, who had been left with his father by Xerxes when passing through Abdera to the invasion of Greece; and he is said to have been afterwards a hearer of Leucippus and Anaxagoras. That he heard Anaxagoras is doubtful, but, if he did, it must have been while Anaxagoras was at Lampsacus; for when this philosopher was banished from Athens (B.C. 450) Democritus was only ten years old. Democritus appears to have been a great traveller. He is said to have visited Egypt, that he might learn geometry from the Egyptian priests; to have been in Persia, and with the Gymnosophists in India, and to have penetrated into Ethiopia. He sojourned for some time at Athens; but from contempt of notoriety, as it is said, was known to nobody in that city. It is for this reason that Demetrius Phalereus, as cited by Diogenes Laertius (ix. 37), contended that Democritus had never visited Athens. One result of his extensive travels was, that he expended all his patrimony, which is said to have exceeded 100 talents. Now, it was a law of his country, that any one who spent his whole patrimony should be refused burial in his native land; but Democritus, having read his chief work aloud to his fellow-citizens, so impressed them with an admiration of his learning, that he not merely obtained a special exemption from the above law, but was presented with 500 talents, and was, on his death, buried at the public expense. (Diog. Laert. ix. 39.) A story substantially the same, though varying somewhat in detail, is given in Athenæus (iv. p. 198.) He is said to have continued travelling till he was eighty years old. He died in the year B.C. 357 at the age of 104. There is a story of his having protracted his life for three days after death seemed inevitable, by means of the smell of either bread or honey, and in order to gratify his sister, who, had he died when first he seemed likely to die, would have been prevented from attending a festival of Ceres. (Diog. Laert. ix. 43; Athen. ii. 7.)

Democritus loved solitude, and was wholly wrapt up in study. There are several anecdotes illustrative of his devotion to knowledge, and his disregard of everything else. They conflict somewhat with one another in their details; but accuracy of detail is not to be looked for, and, tending all to the same point, they prove, which is all that we can expect to know, what character was traditionally assigned to

Democritus. Cicero ('De Fin.' v. 29) speaks of him as, like Anaxagoras, leaving his lands uncultivated, in his undivided care for learning; while, as an instance how these stories conflict, Diogenes Laertius represents him as having, on the division of the paternal estate with his two brothers, taken his own share entirely in money, as being more convenient than land for a traveller. Valerius Maximus (viii. 7) makes him show his contempt for worldly things by giving almost the whole of his patrimony to his country. He is said too to have put out his eyes, that he might not be diverted from thought; but Plutarch ('De Curiositate,' p. 521, C) rejects this story, and explains how it might have arisen. It was Democritus who, struck with the ingenuity displayed by Protagoras in the tying up of a bundle, raised him from the humble condition of a porter, and gained him for philosophy.

Democritus followed Leucippus at a very short distance of time, and preceded Epicurus by somewhat less than a century, as an expounder of the atomic or corpuscular philosophy. He viewed all matter as reducible to particles, which are themselves indivisible (hence called 'atoms'), and which are similar in form. He included mind under the head of matter, recognising only matter and empty space as composing the universe, and viewed mind as consisting of round atoms of fire. (Aristot. 'De Anim.' 1, 2.) Arguing that nothing could arise out of nothing, and also that nothing could utterly perish and become nothing, he contended for the eternity of the universe, and thus dispensed with a creator. He further explained the difference in material substances (mind, as has been said, being one of them) by a difference in the nature and arrangement of their component atoms, and all material (including mental) phenomena by different motions, progressive or regressive, straight or circular, taking place among these atoms and taking place of necessity. Thus the cosmology of Democritus was essentially atheistic.

In psychology he explained sensation, as did Epicurus after him, by supposing particles, *εἰδωλα*, as he called them, or sensible images, to issue from bodies. He also thought to explain men's belief in gods by the supposed existence of large images of human form in the air. In moral philosophy he announced nothing more than that a cheerful state of mind (*εὐεστρά, εὐθυμία*) was the only thing to be sought after. The manner in which the follies of men affected him, and from which he derived his name of the 'laughing philosopher,' is well known. (Juv. x. 33-55.)

A list of the very numerous writings of Democritus is contained in Diogenes Laertius (ix. 46-49.) They are arranged under the five principal heads of ethics, physics, mathematics, general literature, and arts; and there are besides a few of miscellaneous character. The list, classified in the same manner, and enriched with critical remarks, is given in Fabricius ('Bibliotheca Græca,' ed. Harles. vol. ii. p. 634-641.) The reader will see in this work a list of the writings wrongly attributed to Democritus, and statements of the grounds on which they are severally pronounced spurious; among them are the writings on magic which are spoken of by Pliny ('Hist. Nat.' xxx. 1), and considered by him as genuine.

For an account of the philosophy of Democritus the reader is referred to Hill, 'De Philosophia Epicurea, Democritea et Theophrastea,' Geneva, 1669; Ploucquet, 'De Placitis Democriti Abderitæ,' Tübing., 1767; Cudworth, 'Intellectual System,' chap. i.; and to the common histories of philosophy; and for general information concerning his life to Bayle's 'Dictionary,' and Fabricius' 'Bibliotheca Græca,' ed. Harles., vol. ii. p. 628.

DEMOIVRE, ABRAHAM, was born at Vitry in Champagne, on the 26th of May 1667, and was descended of an ancient and honourable family of the French Protestant church. The revocation of the Edict of Nantes in 1685 compelled him to leave his native country, and, like a great number of the refugees created by that revocation, he settled in England, choosing for the field of his efforts the metropolis. He appears at the earliest period to which any account of him reaches to have devoted himself to teaching mathematics, as the surest means of obtaining a subsistence. He also, though he was not the first who adopted that plan, read lectures on natural philosophy: but it does not appear that his attempts in this way were very successful, he being neither fluent in the use of the English language, nor a good experimental manipulator.

The popularity, as a book to be talked about, of Newton's great work, compelled Demoivre to enter upon the study of it; and there is no doubt that he was one of the few who at that time were able to follow the illustrious Newton in the course of his investigations. Demoivre's power however lay in pure mathematics of the kind now called analytical; for in all his writings there is scarcely a trace either of physical or geometrical investigation to be discerned. His writings on analysis abound with consummate contrivance and skill; and one at least of his investigations has had the effect of completely changing the whole character of trigonometrical science in its higher departments.

At a comparatively early period of his residence in London, Demoivre was admitted to the society of Newton and his immediate circle of personal friends; and many instances of the regard with which he was treated are current amongst the traditions which have reached our own time. This of course led to an intimacy with the leading mathematicians of that period; and his great talents soon obtained

his election into the Royal Society, as well as, ultimately, the corresponding societies of Paris and Berlin. The estimate formed of his abilities, acquirements, and impartiality, is proved by his being nominated as a fit person to decide on the rival claims of Leibnitz and Newton to the invention of the method of fluxions.

Demoivre lived to the advanced age of more than eighty-seven; but as he outlived most of his early associates and friends, his circumstances became greatly reduced. He is said to have sunk into a state of almost total lethargy, the attacks of which often lasted for several days; and his subsistence was latterly dependent on the solution of questions relative to games of chance and other matters connected with the value of probabilities, which he was in the habit of giving at a tavern or coffee-house in St. Martin's Lane. He died on the 27th of November 1754.

Demoivre's writings, we have already remarked, are distinguished by considerable originality of character. His separate publications are as follows:—

1. 'Miscellanea Analytica, de Seriebus et Quadraturis,' 1730, 4to. This work contains several very elegant improvements in the then known methods of termination of series, as well as some new methods.

2. 'The Doctrine of Chances, or the Method of Calculating the Probabilities of Events at Play,' 1718, 4to. This work was dedicated to Sir Isaac Newton: it was reprinted in 1738, with considerable alterations and additions. A third edition was afterwards published, differing little in anything of consequence from the second.

3. 'Annuities on Lives,' 1724, 8vo. A work on the same subject, published by the distinguished Thomas Simpson, in 1742, in which some well-deserved compliments to Demoivre were introduced, led our author to publish a second edition of his work; and it is to be regretted that he was induced to insert some harsh reflections on Simpson's work, which were as unfounded as they were uncalled for by the manner in which Simpson had treated his predecessor's first edition. Simpson however replied to it in an appendix to his work in the following year, "containing some remarks on a late book on the subject, with answers to some personal and malignant representations in the preface thereof." The only excuse that can be urged for Demoivre in this matter is, that he was an old man, that he considered the domain his own, and Simpson as a mere poacher on it, and that he was under the influence of men who wished to crush the rising genius and talents of a man like Simpson, who had not been born to the advantages which enabled him to obtain a regular academical education. Demoivre, notwithstanding his age, had the good sense to see that he had attacked a man with whom he could not cope; but still pride prevented his making any apology to his younger competitor. In 1750 he published a third edition of his work, in which he merely omitted the offensive reflections of his former preface; and here the dispute seems to have terminated. Demoivre also published a considerable number of papers in the 'Philosophical Transactions.' There is not one of these which is not of sterling value on the subjects of which they treat.

*DE MORGAN, AUGUSTUS, was born in 1806 in the small East Indian island of Madura, situated on the north-east coast of Java. His father was an officer in the British army. He can trace his descent also from the mathematician James Dodson, author of the 'Anti-Logarithmic Canon.' Educated at Trinity College, Cambridge, Mr. De Morgan was Fourth Wrangler in 1827, when he took the degree of B.A. Owing to an objection to the subscription test he did not proceed to the M.A. degree. He had entered at Lincoln's Inn and begun his studies with a view to the English bar, when the foundation of the University of London (1828) opened up to him a more congenial career. [What is now known as "University College, London," bore at the time of its foundation the name of "The University of London," and retained this name till 1837. Then, on the proposal of the government to constitute a distinct degree-granting body under the designation of the "University of London," to which a number of colleges might be affiliated on the principle of the non-subscription of tests, the original institution agreed to give up the more general name and, as one of the affiliated colleges, to assume the name of "University College."] Appointed to the Professorship of Mathematics in the new institution, Mr. De Morgan retained it till 1831, when he resigned. On the death of his successor in 1836 however he returned to the post, which ever since that time he has continued to fill to the great distinction of the college. Besides his professorship, Mr. De Morgan has had ample occupation as a consulting actuary, advising insurance offices, and as one of the secretaries and a member of the council of the Royal Astronomical Society. He is also a member of the Cambridge Philosophical Society. But to the world at large he is best known as the author of many mathematical and miscellaneous works. Of the chief of these, published in his own name, the following is a list:—'Elements of Arithmetic,' 1830; 'Elements of Algebra, preliminary to the Differential Calculus,' 1835; 'The Connexion of Number and Magnitude: an Attempt to Explain the Fifth Book of Euclid,' 1836; 'Elements of Trigonometry and Trigonometrical Analysis, preliminary to the Differential Calculus,' 1837; 'Essay on Probabilities, and on their Application to Life-Contingencies and Insurance Offices,' 1838; 'First Notions of Logic, preparatory to the study of Geometry,' 1839; 'The Globes, Celestial and Terrestrial,' 1845; 'Formal Logic; or the Calculus of Inference

necessary and probable,' 1847; 'Arithmetical Books, from the Invention of Printing to the Present Time; being brief notices of a large number of works drawn up from actual inspection,' 1847; 'Trigonometry and Double Algebra,' 1849; 'The Book of Almanacs, with an Index of Reference by which the Almanac may be found for every year up to A.D. 2000; with Means of finding the Day of any New or Full Moon from B.C. 2000 to A.D. 2000,' 1851. Besides these works Professor De Morgan is the author of the treatises on 'The Differential and Integral Calculus,' and 'Spherical Trigonometry,' published by the Society for the Diffusion of Useful Knowledge. He contributed largely to other publications of this Society, of the managing committee of which he was for some time a member. He was one of the most extensive contributors to the original edition of the 'Penny Cyclopædia;' most of the mathematical and astronomical articles, as well as many of the articles of scientific biography were written by him. Among other periodicals to which he has contributed are, 'The Companion to the Almanac,' 'The Transactions of the Cambridge Philosophical Society,' 'The Philosophical Magazine,' the 'North British Review,' the 'Athenæum,' &c., &c. Besides being a profound mathematician and astronomer, he has a great affection for and an extensive and minute erudition in all kinds of literary history, biography, and antiquities. He is also versed in metaphysical and logical studies; and his 'Formal Logic' mentioned in the above list is one of the most remarkable of recent works in logical sciences. In connection with this work is still remembered, as one of the most interesting of the learned controversies of the day, a controversy which took place in the year 1847 between Mr. De Morgan and Sir William Hamilton of Edinburgh, relative to Mr. De Morgan's title to an independent discovery of a new principle in the theory of syllogism expounded by Sir William Hamilton. A pamphlet on the subject was published by Sir William; to which Professor De Morgan replied. In the recent agitation for a decimal coinage Professor De Morgan has taken an active part, throwing much light on the subject by numerous letters and articles.

DEMOSTHENES was born probably in B.C. 384 or 385. He was the son of Demosthenes, an Athenian citizen of the demus Pæania, who carried on the trades of cutler and cabinet-maker, and of Cleobule, the daughter of Gylon. This Gylon, who had been governor of Nymphæum, an Athenian settlement in the Tauric Chersonesus, betrayed it to the Scythians, and afterwards taking refuge with their chief, married a Scythian woman, who was the maternal grandmother of Demosthenes. This impurity of blood, and the misconduct of Gylon, his maternal grandfather, formed a theme for the taunts of Eschines. ('Oration against Ctesiphon.') There is a well-known allusion in Juvenal to the trade of Demosthenes the elder (x. 130). The point of the satirist is however somewhat lost, when we remember that Plutarch applies to the father a term which expresses all that can be said to the advantage of a man, and that he had two manufactories containing on the whole more than fifty slaves. (Creuzer, 'View of Slavery in Rome,' note 40, and the 'Orations of Demosthenes against Aphobus.')

Demosthenes the elder died when his son was seven years old, leaving him and a sister, younger than himself, to the care of three guardians—Aphobus and Demophon, his first cousins, and Therippides, a friend. The property left by him amounted to fifteen talents (above 3000*l.* in specie, taking silver as the standard). The guardians however, as we learn from Demosthenes himself, disregarded all his father's injunctions, and, while they neglected to improve the property of which they were trustees, embarrassed nearly the whole of it. ('Orations against Aphobus.') Plutarch states that they also deprived Demosthenes of proper masters. He himself however, in a passage where it is his object to magnify all that concerns his own history, boasts of the fitting education which he had received. ('Orations on the Crown,' p. 312.) He is said to have studied philosophy under Plato, and to have been a pupil of Eubulides of Miletus.

Having heard Callistratus plead on one occasion, he was fired by that orator's success with ambition to become an orator himself, and he accordingly received instructions in the rhetorical art from Isæus. Cicero ('De Oratore,' ii. 94) mentions Demosthenes as one of those who came forth from the school of Isocrates; Plutarch, on the other hand, expressly states that he was not a pupil of Isocrates, and goes out of his way to invent reasons why Demosthenes should have preferred the instructions of Isæus. We assume however that Isæus was his principal instructor, in accordance with the testimony of the various biographers. (Libanius, Zosimus.) We are told that many suspected the speeches against his guardians to have been written, while others said that they were corrected, by Isæus, partly because Demosthenes was so young when they were delivered, and partly because they bore marks of the style of Isæus. He is said to have taken lessons in action from Aristoniceus, a player.

The physical disadvantages under which Demosthenes laboured are well known, and the manner in which he surmounted them is often quoted as an example to encourage others to persevere. It should be observed however that the authority for some of these stories is but small, and that they rest on the assertions of writers of late date. He was naturally of a weak constitution; he had a feeble voice, an indistinct articulation, and a shortness of breath. Finding that these defects impaired the effect of his speeches, he set resolutely to work

to overcome them. The means which he is said to have taken to remedy these defects look very like the inventions of some writer of the rhetorical school, though Plutarch ('Demosth.,' x.) quotes Demetrius the Phalerian as saying that he had from the orator's own mouth what Plutarch has stated in the chapter just referred to. Among these means we hear of climbing up hills with pebbles in his mouth, declaiming on the sea-shore, or with a sword hung so as to strike his shoulder when he made an uncouth gesture. He is also said to have shut himself up at times in a cave under ground for study's sake, and this for months together.

Having been emancipated from his guardians, after a minority of ten years, he commenced a prosecution against them to recover his property. Estimating his losses at thirty talents (inclusive of ten years' interest), he sued Aphobus for one-third part, and gained his cause, without however succeeding in obtaining more than a small part of his money. This took place B.C. 364, when he was in his twentieth year, or, as he says himself ('Mid.' 539, § 23), when he was quite a boy; but the extant orations against his guardians are evidently not the work of a youth of that age, as a careful perusal of these orations will clearly show. He subsequently adopted the profession of writing and delivering, as a hired advocate, speeches for persons engaged in private and public causes—a practice which was now generally adopted by the Greek orators, and was attended with considerable profit. His first speech on a public occasion was made in B.C. 355, in which year he wrote the speech against Androton, and wrote and delivered that against Leptines.

Of his speeches relating to public concerns, there are three which have a direct bearing on his personal history: the speech against Midias; that concerning Malversation in the Embassy; and that in behalf of Ctesiphon, or, as it is commonly called, the 'Oration on the Crown.' The two last are briefly noticed under the article *Æschines*. [*ÆSCHINES*.] With reference to the first, it should be premised that, in the year B.C. 351, Demosthenes voluntarily undertook the expensive office of Chorus, and that, during the performances at the Dionysia, when discharging his duties, he was insulted and struck by Midias. Demosthenes brought an action against Midias for assaulting him in the performance of what was regarded as a religious duty, and thus Midias was involved in a prosecution for sacrilege. Demosthenes obtained a verdict. The extant oration against Midias was written three years afterwards.

The first speech on a public affair that remains, and probably the first which Demosthenes published, is that on the Symmories, which was delivered B.C. 354. A few words will be necessary to explain the state of parties at the time.

About ten years previous to this oration the power of Sparta had been broken by Thebes, who in her turn sank into inactivity after the death of her great general Epaminondas in the battle of Mantinea, B.C. 362: three years after this time Philip of Macedon began his reign. His first step, after defeating two other claimants to the throne and compelling the Pæonians and Illyrians to submission, was to possess himself of several Greek colonies to the south of Macedonia, and to interfere in a war of succession then going on in Thessaly. Athens, not yet recovered from the effects of the Peloponnesian war, had been engaged from B.C. 357 to B.C. 355 in a war with her allies, Rhodes, Chios, Cos, and Byzantium, which ended in their throwing off the yoke under which she had held them, about a year before the delivery of the oration on the Symmories. There were, as usual, two parties in Athens. With one of these, which was headed by Phocion, Philip had an intimate connection, and this party was not unfavourable to his designs, either through want of energy or from believing that they would do Greece no injury. The other party, called by Mitford the 'War Party,' was headed by a profligate general named Chares, and was that to which Demosthenes was afterwards attached.

Perhaps the most important event of the time was the war occasioned by the seizure of the temple of Apollo at Delphi by the Phocians. There had been a dispute as to the sacred land, which had long belonged to Phocis, and the Amphictyonic council asserting their claim, Philomelus the Phocian seized the temple, and its treasures were freely used in the war, which continued till B.C. 346. It was through this war that Philip contrived to identify his interests with that of the Amphictyons at large, and at last to be elected their leader; and hence we must generally consider the leading parties in the struggle between Philip and Demosthenes to have been the Amphictyonic states and Macedon on the one side, against Athens and occasionally Persia on the other; while we must remember that in Thebes, the principal Amphictyonic state, there was a strong party against Philip, as in Athens there was one equally strong for him.

Under these circumstances, Demosthenes made his oration on the Symmories, which in part relates to a question of finance, but more particularly to a scheme then on foot for sending Chares with an armament into Asia against the Persians; a project utterly preposterous, as Athens had enough to do to hold her ground against the refractory colonies and subject states, without engaging in other undertakings. Against this measure Demosthenes directed his eloquence with success, and this may be considered the beginning of his struggle with Philip, for the Macedonian cause would have gained by any loss which Athens might sustain. About a year after, Philip began to take an active part in the affairs of the Sacred War, as that in Phocis is usually

called. He defeated the Phocian alliance, and only retired, as it should seem, to avoid any rupture with Athens, such as might preclude all hope of adding her to the number of his auxiliaries. At this juncture Demosthenes, who had been opposed to the former war, joined Chares, and delivered his first Philippic.

The motive of this apparent change of opinion is evident: on the former occasion he saw that war would have been the dispersion of strength which was needful for a nearer struggle; now, he saw that the time for that struggle was come, and knew that, to be effectual, Athens must direct it. ('Oration on the Crown,' p. 249.) But Athens, however powerful when roused, had lost much of that spirit of individual bravery which characterised her in the best times of her history. The exhortations of Demosthenes failed in producing the desired effect; nor was it till Philip had defeated Kersobleptes the Thracian, whom it was the interest of the Athenians to support as his rival, that they considered themselves compelled to commence military operations against him.

This was at last done by sending successive expeditions to Olynthus, a maritime town near the isthmus of Pallene; and by an inroad into Eubœa, under the direction of Phocion, by means of which the Macedonian influence was lessened in that island. The former step was however the more important, as Olynthus was a place of strength, and was looked on with great jealousy by Philip.

Olynthus had made alliance with Athens contrary to a compact with Philip, and although well enough supplied with arms and men, it required the assistance of Athenian soldiers. To provide for these expeditions, Demosthenes, in his Olynthiac orations, advised the application of the money appropriated to the public festivals, and in so doing was opposed by Phocion. In spite however of the exertions of Demosthenes, Olynthus was taken by Philip in the spring of B.C. 347. Early in the succeeding year Demosthenes, with Æschines and eight or nine others, went on an embassy to Philip, to treat of peace. According to Æschines, he exhibited great want of self-possession on this occasion. If this were the case, it is surely not too much to attribute it to a consciousness that he had departed through fear of present danger from his one great object of opposition to Philip, who, even during the settlement of preliminaries, seized on several Thracian towns. The motive which urged Demosthenes to agree to a peace is probably that assigned by Schaumann (see also Demosthenes, 'Oration on the Peace'), that the means of resistance were too small to allow any hope that Athens alone could use them effectually. Be that as it may, Demosthenes never slackened his efforts; and in B.C. 343 we find him accusing Æschines of malversation in the former embassy, and acting as one in a second embassy to counteract Philip's influence in Ambracia and Peloponnesus. Since the cessation of the Phocian war in B.C. 346 this influence appears to have increased, as well by the weakening of Sparta and Thebes as by his acquisition of two votes in the Amphictyonic council; hence the renewed energy of Demosthenes and the expedition of Diopithes to the Hellespont, for the purpose of protecting the Athenian corn-trade. ('Oration on the Crown,' p. 254.)

About this time too Demosthenes became in a more decided sense the leader of his party in the room of Chares, and for the next two years employed himself in supporting and strengthening the anti-Macedonian party in Greece. His principal measures were an embassy to the Persians; the strengthening of the alliance with Byzantium and Perinthus for the purpose of forming alliances; and the relinquishment by Athens of all claim on Eubœa, in which Phocion concurred.

The struggle now began. Philip laid siege to Perinthus, to Selymbria, and afterwards to Byzantium, and fitted out a fleet. At this juncture Demosthenes delivered his fourth Philippic, in which, among other things, he recommended the restoration of the festival-money to its original use, alleging the scruples felt by some concerning its application to military purposes, and the increase in revenue which rendered that application no longer necessary. In B.C. 339 the siege of Byzantium and Perinthus was raised, and a short peace ensued; but in the succeeding spring Philip was chosen Amphictyonic general. The object of Demosthenes was now somewhat changed. Before, he had to oppose a foreign influence which sought to insinuate itself into the affairs of the Grecian States; now that wish had been gained, and his business became that of arranging party against party in the different sections of the same nation.

From this time till the battle of Chæronea he was engaged in negotiations to detach different states from the Amphictyonic alliance. At Thebes he was completely successful: a strict alliance was concluded between Thebes and Athens, and Demosthenes became almost as much the minister of the one state as of the other. He defeated all the counter-efforts of Python, Philip's agent, and procured the preparation of an army and fleet to act against Philip, who had seized and fortified Elateæ, a principal town in Phocis. But his hopes were again destroyed at the battle of Chæronea in the summer of B.C. 338, and Philip remained apparently master of the destinies of Greece—perhaps not unaided in the conflict by a superstition which considered his cause as in some sort identified with that of Apollo, the Delphian god. Under these circumstances, the party of Phocion made some faint attempts at action; but Philip, with his usual remarkable policy, forestalled them by releasing his Athenian prisoners, and using his victory with the greatest moderation.

Demosthenes joined in the flight from Chæronea, not, as his enemies

have affirmed, without some disgrace; but at the funeral ceremony for those who fell he was called upon to pronounce the customary oration (which however has been decided not to be that which goes under this name), and he resumed his place at the head of the government. He became virtual-provider for the city, superintended the repairs of the fortifications, and was proceeding with his usual vigour in prosecuting his political schemes, when news came that Philip had been assassinated, July B.C. 336. The conduct of Demosthenes on this occasion, as reported by Plutarch and Æschines, has sometimes furnished a subject for strong animadversion. He is said to have appeared in a white robe, although his daughter was just dead, and he or his friends proposed honours to the memory of the assassin of Philip. As to the first of these charges, it may be said in his defence that it only indicates how completely devoted he was to the cause of his country, even to the exclusion in a great degree of private affections.

On the accession of Alexander, Demosthenes persevered in his decided opposition to Macedon. Alexander's first employment, after his election as stateholder by the Amphictyonic league, was to quell an insurrection in the northern and western provinces of Macedonia. While he was absent a report of his death was spread at Thebes, which revolted from the confederacy. Demosthenes (Plutarch) fanned the flame of this insurrection, and, on Alexander's sudden appearance before Thebes, Demosthenes was appointed to confer with him; but he went only to the borders of Attica. As Alexander demanded his person immediately after the destruction of Thebes, together with nine other Athenians, on the pretext of trying them as traitors, it is most probable that, when he was sent on the mission to Thebes, he had reason to fear some act of violence if he put himself in the power of Macedon. Demades, a man as high in point of intellect as he was debased in morals, was the negotiator in his place, and by some means or other contrived to save Demosthenes. Plutarch relates ('Life of Phocion') that a bribe was given to Demades to persuade him to exertion in behalf of Demosthenes, but it is hardly probable.

During Alexander's Persian expedition Demosthenes had to sustain an attack from his old rival Æschines. He defended himself from the charges brought against him [ÆSCHINES in the oration called that 'On the Crown.' But we hear little of him as a public man. He probably considered that, at a time when the chief enemy of the liberties of Greece was employed in schemes most likely to conduce to her welfare, from the ruinous effect they promised to produce on the strength of Macedonia, any measures likely to recall Alexander from Asia would only be the means of binding still faster those chains which it had been his own constant aim to loosen.

The only affair of moment in which Demosthenes was at this time engaged was occasioned by the treachery of Harpalus, one of Alexander's generals, who had been left governor of Babylon when Alexander proceeded on his Indian expedition. Harpalus, having grossly abused his trust, fled to Europe on the return of Alexander, accompanied by 6000 Greek soldiers. He came to Athens as a suppliant, and engaged the orators to support him. All but Demosthenes espoused his cause with readiness, and he at last concurred, not without suspicion of bribery. (Plutarch.) The Athenians however refused to listen to his proposal of organising a movement against Alexander, and prosecuted Demosthenes for recommending measures not for the good of the state. He was fined fifty talents by the Areopagus, and being unable or unwilling to pay this sum, retired to Ægina and Troezen, where he remained from B.C. 324 till the death of Alexander, which occurred in the following year. Immediately on the news of that event he renewed his opposition to Macedon, even before his recall, which Plutarch says was owing to this conduct. He was recalled by a decree of the people; and a trireme was sent to Ægina to carry him back to Athens, his progress from the port to the city being a continuous triumph.

During the Lamiæ war he presided at Athens, and when Antipater defeated the confederate Greeks, and marched upon the city, Demosthenes, as the prime mover of the confederacy, judged it prudent to withdraw to Calauria, a little island opposite Troezen, where he took refuge in a temple of Poseidon. Macedonian messengers were sent to persuade him to accompany them to Antipater, but he resisted all their entreaties. Plutarch, from whom this account is taken, says that he retired into the inner part of the temple under pretence of writing a letter, and while there took poison, which he had for some time carried about his person, and died before he could get out of the temple. Another account, which Plutarch also gives as coming from one of Demosthenes' friends, is, that "by the singular favour and providence of the gods he was thus rescued from the barbarous cruelty of the Macedonians;" in other words, that he died of some sudden attack brought on by the anxiety and disappointments of the last few weeks of his life.

Demosthenes seems to have been actuated all through his political life by the strongest passion to promote the interests of his native state; and if he only delayed the fate of his country he did what no one else seems to have attempted. It is the highest praise of his prudence and foresight that all his political predictions were verified; as he distinctly foretold, it was the influence of Macedon, and not internal dissension, which destroyed the sovereign and independent political communities of Greece. Those who expect to find in his style of oratory the fervid and impassioned language of a man carried

away by his feelings to the prejudice of his judgment, will be disappointed. He is said not to have been a ready speaker, and to have required preparation. All his orations bear the marks of an effort to convince the understanding rather than to work on the passions of his hearers. And this is the highest praise. Men may be persuaded by splendid imagery, well-chosen words, and appeals to their passions; but to convince by a calm and clear address, when the speaker has no unfair advantages of person or of manner, and calls to his aid none of the tricks of rhetoric,—this is what Cicero calls the oratory of Demosthenes, the ideal model of true eloquence. ('Orations,' c. 7.) Most of the speeches of Demosthenes on political affairs, as we now possess them, are laboured compositions, which have evidently been frequently corrected by the author before he brought them into that state in which they now appear. Notwithstanding the easy flow of the language, the art and industry of the orator are visible in almost every line; and in nothing are they more apparent than in the admirable skill by which he makes almost every period produce its effect, and in the well-judged antithesis which gives such force and precision to his expression, that it seems as if no other words and no other order of words could be so appropriate as those which he has chosen. The style of many of the orations on civil matters which were delivered before the courts of justice, is very different; there is an air of easy negligence about them, and an absence of that laboured accuracy which characterises his other compositions. It is not unusual to find sentences that might be called grammatically incorrect. But these orations are invaluable as specimens of what we now call stating a case, and well worth the attentive study of those who would make themselves acquainted with the social condition of Athens at that time.

The orations of Demosthenes may be divided into two great classes, political and judicial, and this last again into those delivered in public and those in private causes—the distinction between public and private causes being roughly that which in English law exists between criminal and civil cases.

Those of the first class which are extant were delivered in the following order:—The oration on the Symmorion, B.C. 354; for the Megalopolitans, B.C. 353; the 1st Philippic, B.C. 352; for the Rhodians, B.C. 351; the three Olynthiacs, also called the 2nd, 3rd, and 4th Philippics, B.C. 349; the 5th Philippic (which forms part of the 1st in our present copies), B.C. 347; the 6th Philippic, also called the oration on the Peace, B.C. 346; the 7th Philippic, B.C. 344; the 8th Philippic, also called the oration concerning Halonnesus, B.C. 343; the 9th Philippic, also called the oration on the Chersonesus, the 10th and 11th Philippics (also called the 3rd and 4th), all in B.C. 341; the 12th Philippic, also called the oration against the Letter, B.C. 339; the Funeral oration, B.C. 338; and the oration on the treaty with Alexander, after B.C. 334. Of these, that concerning Halonnesus, the 11th Philippic, also called the 4th, and that against the Letter, are decided to be of doubtful authority, as is also the oration on the Contribution (*περὶ συνδράμης*), which is of doubtful date, that on the treaty with Alexander, and the Funeral oration.

Of the first division in the second class, we find those against Androtion and Leptines, B.C. 355; that against Timocrates, B.C. 353; that against Aristocrates, B.C. 352; that against Midias, B.C. 348; that on Malversation in the Embassy, B.C. 348; that against Neaira, about B.C. 340; that against Theocritus, after B.C. 336; the two against Aristogiton, after B.C. 333; that on the Crown, B.C. 330. Those who are curious respecting the date of the last-mentioned orations, may refer to Clinton ('Fasti Hellenicæ,' p. 361), from whom these dates are taken.

Of the second division are the three against Aphobus, the two against Onetor, and that against Callippus, all in B.C. 361; those against Polyceles, and on the Naval Crown, after B.C. 361; that against Timotheus, before B.C. 351; that against Euergus and Mnesibulus, after B.C. 356; that against Zenothemis, after B.C. 355; those against Boeotus and for Phormio, B.C. 350; the two against Stephanus, before B.C. 348; that against Boeotus about the dowry, B.C. 347; that against Pautenetus, after B.C. 347; that against Eubulides, after B.C. 346; that against Conon, after B.C. 343; that against Olympiodorus, after B.C. 343; that in the cause of Phormio, after B.C. 336; that against Dionysodorus, after B.C. 331. To these must be added, that against Apaturius; that in the cause of Laeritus; that against Nausimachus and Xenophanes; those against Spudias, Phænippus, Macartatus, Leochares, Nicostratus, and Callicles. Of these in the second class doubts are entertained regarding the authenticity of those against Neaira, Theocritus, Aristogiton, Onetor, Timotheus, Euergus and Mnesibulus, Stephanus, Eubulides, Phænippus, and Nicostratus; but of these Schaumann decides for those against Timotheus and Eubulides.

The orations of Demosthenes were edited ten times in the 16th century, and twice in the 17th. They have been re-edited by Taylor, Reiske, the Abbé Auger, Schœfer, Bekker, and Dindorf. The text of Bekker, which is now the standard, is founded on a careful collation of the manuscripts. Of separate orations, F. A. Wolf has given an edition of that against Leptines; Rüdiger of that on the Peace, of the 1st Philippic, and the three Olynthiacs; Buttman and Blume of the Midias; and Vömel of the Philippics.

The orations of Demosthenes and Æschines were translated into

German with notes, by J. J. Reiske, Lemgo, 1764; a correct, but tasteless version. The political speeches were translated with notes, by Fr. Jacobs, Leipzig, 1805-8; and the eleven Philippics, by Alb. Gerh. Becker, Halle, 1824-26. There are also other German translations of some of the speeches. There is a French translation of Demosthenes and Æschines by Auger. Leland has translated into English all the orations which refer to Philip, including the Philippics and Olynthiacs, with the oration of Æschines against Ctesiphon, and one by Dinarchus, but with no great success. To express the simplicity, perspicuity, and force of the original, would require the translator to possess powers the same in kind as those which Demosthenes himself possessed, and near them in degree.

(Thirlwall, Grote, and Mitford, *Histories of Greece*; Schaumann, *Prolegomena to Demosthenes*; Plutarch, *Demosthenes*; Life by Zosimus of Acalon; *Lives of the Ten Orators*; Taylor, *Life of Demosthenes*; Becker, *Demosthenes als Staatsmann und Redner*; Westermann, *Questiones Demosthenice*; Clinton, *Fasti Hellenici*, and the *Orations of Demosthenes*.)

Bust of Demosthenes, Townley Gallery, British Museum.
Height, 1 foot 8½ inches.

DEMOUSTIER, CHARLES ALBERT, a French writer, born at Villers-Cotterets, March 11, 1760. He was connected on his father's side with the family of Racine. He was educated at the college of Lisieux; and for some time followed the profession of advocate, but quitted it for literature. The work which chiefly brought him into notice was his 'Lettres à Emilie sur la Mythologie.' These letters are written in a pleasing style, and attained that popularity which is usually awarded to works on learned subjects, when written in an amusing manner. Indeed it appears to have gained more than its just meed of applause, and the consequence was, that when this had subsided, a re-action took place, and the work was censured with too much severity. His other works are chiefly theatrical; of these 'Le Conciliateur,' a comedy in verse, was one of the best and most successful; there is not much humour in it, and scarcely any delineation of character, but the plot is excellently constructed, the incidents are striking and uncommon, and the author has acquitted himself well of the difficult task of expressing moral sentiments, without being mawkish. An anecdote is told of Demoustier which proves his excessive good humour. A young man being present at the representation of one of the author's comedies, felt by no means satisfied, and requested the gentleman beside him to lend him a hollow key (whistling with a key being the French mode of expressing disapprobation); the gentleman complied with his request, and was no other than Demoustier himself. His collected works have been published in 5 vols. 8vo and 12mo. He died at the place of his birth on the 2nd of March 1801.

DEMPSTER, THOMAS, was the son of Thomas Dempster, of Muirkirk, in Aberdeenshire, where he was born, on the 23rd of August 1579. His life is a series of strange adventures, where the literary triumphs of the wandering scholar are mingled with fierce controversy and occasional deeds of armed violence. His wild career seems to have commenced in the centre of his domestic circle, of the morality of which he gives a startling picture, telling how one of his brothers had taken to wife his father's concubine, collected a band of ruffians, with whom he surrounded and attacked that father and his attendants; afterwards fled to Orkney, where he headed a band of freebooters, who, among other violence, burned the bishop's palace, and ended his career as a soldier in the Netherlands, where he was put to death as a criminal by being torn limb from limb by wild horses. Thomas Dempster commenced his classical studies at Pembroke Hall, Cambridge, at the age of ten, and completed his education at Paris, Louvain, and Rome. He took the degree of D.C.L., and was made regent in the college of Navarre, in the University of Paris, at a time when, according to his own account, he must have been but seventeen years

old. The history of his various wanderings from university to university, his literary contests, and his personal quarrels, is too long to be followed out on this occasion. Being at one time left by the principal of the college of Beauvais, in the University of Paris, as his locum tenens, he caused a student of high and powerful connections to be ignominiously flogged. Several relatives took up the student's cause, and made an armed attack upon the college; but Dempster showed that he had resources equal to the occasion: he fortified his college, stood a sort of siege, and concluded the affair by taking some of the belligerent prisoners and confining them in the college belfry. After this affair he fled from France. At the beginning of the year 1616 he was in England, where he married Susanna Waller, a woman whose disposition appears to have been of a no less hardy and reckless character than his own. Some time afterwards, when he was passing through the streets of Paris with this woman, her remarkable beauty and the degree to which she exposed her person, brought on them the dangerous attentions of a mob of followers, and compelled them to seek refuge in an adjoining house. Afterwards, while Dempster was teaching the belles-lettres in the University of Bologna, where he seems to have involved himself in a more than usual number of disputes, he found that his wife had eloped with either one or more of his students. After an ineffectual attempt to overtake the fugitives, he died at Butri, near Bologna, on the 6th of September 1625, the victim apparently of overwrought energies and a broken spirit. Dempster's works are more celebrated for their profuse miscellaneous learning than their critical accuracy. They are very numerous. Dr. Irving, in his 'Lives of Scottish Writers,' gives a list of fifty, stating that the list is as complete as he has been able to make it. His 'Antiquitatum Romanarum Corpus Absolutissimum,' an edition, or rather an enlargement, of the work by Rosinus, bearing that title, published in 1618, is well known. There are many editions of it, and it forms, both in the substance and illustrations, the foundation of Kennet's and other popular books on Roman antiquities. His 'De Etruria Regali,' left in manuscript, was magnificently edited in 1723-4, in two volumes, folio, by Sir Thomas Coke. His 'Historia Ecclesiastica Gentis Scotorum' was published at Bologna in 1627, and was reprinted for the Bannatyne Club in 1829. It is simply a biographical dictionary of Scottish authors, and as such has been often referred to in this work. In many instances its information may be depended on, but whoever consults the work must bring with him some previous critical knowledge of the subject, as the author is very prone to exaggerate the literary achievements of his countrymen. He not only makes out to be Scotsmen persons whose birth-place is the subject of doubt—for example, Joannes de Sacrobosco, Erigena, &c., but also includes such names as Eglesham, Fust, St. Fiacre, St. Novatus, Pelagius, and Rabanus Maurus, who are well known not to have been natives of Scotland.

DENHAM, SIR JOHN, born at Dublin in the year 1615, was son of Sir John Denham, who was some time chief baron of the Court of Exchequer in Ireland. His father being afterwards made a baron of the Exchequer in England, he was brought to London in 1617, where he received his grammatical education. In the year 1631 he became a gentleman commoner of Trinity College, Oxford, where, after studying for three years, he took the degree of Bachelor of Arts. He subsequently entered himself at Lincoln's Inn, studied the law pretty closely, and might have done well, had not an immoderate passion for gaming exhausted his money, and drawn on him the displeasure of his father. He however abandoned the mischievous pursuit, and wrote an essay against gaming, by which he regained his father's favour, though his reformation appears to have been feigned, as immediately after his father's death his fondness for play returned. In 1641 he gained great celebrity by his tragedy of 'The Sophy,' which was acted at Blackfriars with much applause; and his fame was increased by his 'Cooper's Hill,' written in 1643, almost the only one of his poems that is now read. In the year 1647 he performed many secret and important services for Charles I., when prisoner in the hands of the army, which being discovered, he was forced to escape to France. In 1652 he returned to England, and resided at the Earl of Pembroke's; and at the restoration of Charles II. he was appointed surveyor-general of his majesty's buildings, and created knight of the Bath. He died in the year 1688, his understanding having been for some time impaired by domestic grievances.

The admirers of Denham usually limit their praises to 'Cooper's Hill,' and some lines on the Earl of Strafford; while others confine their commendations to two lines in the former poem, wherein he describes the Thames:—

"Though deep, yet clear; though gentle, yet not dull;
Strong without rage, without o'erflowing full."

This is a most happy combination of words; the bringing into contrast expressions which only vary in shades of meaning is highly ingenious. The whole passage relating to the Thames is written with much spirit, and striking lines might be selected from other parts; yet, taken as a whole, the poem is heavy and purposeless, and, though short, tedious.

Readers of the present day, on perusing the poems of Denham, will perhaps wonder what could be the cause of the high commendations bestowed on him by his contemporaries; but to look at him from

a fair point of view, and to assign him his due portion of merit, it will be necessary to consider him as one of the reformers of English verse. At the beginning of the 17th century the art of versification was in a very imperfect state, as may be seen from reading the prologues to our early dramas; and hence a poem of the length of 'Cooper's Hill,' written with tolerable smoothness, was something remarkable.

DENINA, CARLO GIOVANNI MARIA, born in 1731, at Revello in Piedmont, studied at Saluzzo and Turin, took priest's orders, and was made professor at Pinerolo. Having discussed rather freely, in a play which he composed, the various systems of education, he incurred the dislike of the Jesuits, who had at that time the monopoly of education, and he was dismissed from his chair. Repairing to Milan, he wrote a work, 'De Studio Theologicis, et Norma Fidei,' 1758, which was much approved of, and the author was soon after recalled to Piedmont, and appointed professor of humanities and rhetoric in the High College of Turin. He then began his work on the revolutions of Italy, which is a general history of Italy from the Etruscan times to the beginning of the 17th century: 'Istoria delle Rivoluzioni d'Italia,' in 24 books, to which he added afterwards a 25th book, which brings the narrative down to 1792. This was the first general history of Italy, with the exception of the 'Annals' of Muratori, and although it is at times deficient in sound criticism, it is not destitute of merit. The work has been translated into almost all the European languages. In 1777 Denina went to Florence, where he published anonymously his 'Disscorso sull' Impiego delle Persone,' which was intended as a reply to certain charges brought against his historical work by ecclesiastical critics, because Denina had censured the abuses of monastic institutions, and had questioned the propriety of binding a vast number of persons to celibacy. There was a law in Piedmont by which any native of that country was forbidden to publish a book, even in a foreign country, without the previous sanction of the Turin censorship. Denina was in consequence deprived of his chair, and banished to his native town. The Archbishop of Turin however took up his defence, and he was allowed to return to the capital, where some time after he received, through the Prussian envoy, an invitation from Frederic II. to repair to Berlin, for the purpose of writing a work on the revolutions of Germany. Denina accepted the offer, and repaired, in 1782, to Berlin, where he remained many years, and where he composed his 'Rivoluzioni della Germania,' and also 'La Russiade,' being a panegyric history, in poetical prose, of Peter the Great. He also wrote a work in French on Prussian literature, 'La Prusse Littéraire sous Frederic II., ou histoire abrégée de la plupart des auteurs, des académiciens, et des artistes qui sont nés ou qui ont vécu dans les Etats Prussiens depuis 1740 jusqu'en 1786, par ordre alphabétique,' 4 vols. 8vo, Berlin, 1790-91. He also wrote an 'Essai sur la Vie et le Règne de Frederic II.' In 1792 Denina revisited Italy, and after his return to Berlin he wrote 'Considérations d'un Italien sur l'Italie,' in which he gave an account of the contemporary literature of his native country, for the information of the philologists of Germany. Another and a more important work is his 'Vincende della Letteratura,' 4 vols. 8vo, in which he sketches with concise but clever touches the progress and vicissitudes of the literature of the various nations of Europe. The book displays a vast extent of bibliographical erudition.

In 1804 Denina was introduced to Napoleon at Mainz, to whom he dedicated his 'La Clef des Langues, ou observations sur l'origine et la formation des principales langues de l'Europe.' Soon afterwards he was appointed imperial librarian. He then removed to Paris, where he wrote his 'Istoria dell' Italia Occidentale,' being a sort of supplement or continuation of his 'Rivoluzioni d'Italia.' It is a history of Piedmont and Liguria, and contains much information derived from the local chronicles and documents, which Denina had consulted while he lived in his native country. He also wrote 'Tableau historique, statistique, et moral de la Haute Italie,' which was afterwards translated into Italian. Denina died at Paris, at an advanced age, in December 1813. Besides the works above mentioned, he wrote many minor ones, among which the following are deserving of notice:—1. 'Guide Littéraire,' being a sketch of the Prussian monarchy, and of its civil and literary institutions. 2. 'Della Lodi di Carlo Emanuele III., Ré di Sardegna.' 3. 'Elogio storico di Mercurino di Gattinara, Gran Cancelliere dell' Imperatore Carlo V., e Cardinale.' It contains a sketch of the condition of Spain under Charles V. 4. 'Elogio del Cardinale Guala Bicchieri,' who was a papal legate in England about 1222. 5. 'Réponse à la question: que doit on à l'Espagne?' Berlin, 1786, and afterwards translated into Spanish. It is a reply to some harsh judgments upon Spain in the article 'Espagne' in the 'Encyclopédie Méthodique.' Denina shows that Spain has contributed more than is generally supposed to the European stores of sciences, letters, and fine arts. 6. 'Essai sur les traces anciennes du Caractère des Italiens modernes, des Sardes, et des Corses.' Denina was a great supporter of the theory of the influence of climate on the character of nations. 7. 'Bibliopæa, ossia l'Arte di compor Libri.' 8. 'Istoria politica e letteraria della Grecia libera,' which ends at the death of Philip, father of Alexander.

(Ugoni, *Della Letteratura Italiana nella seconda metà del Secolo XVIII.*; Barbier, *Notice sur la Vie et les principaux ouvrages de Denina*, in the *Magasin Encyclopédique* for January 1814.)

DENMAN, LORD. Thomas Denman, first Lord Denman, was the

only son of a London physician, who held a post in the household of George III., and represented a family settled for several generations near Bakewell in Derbyshire. He was born in 1779, and received his early education at Palgrave School in Suffolk, near Diss, under the celebrated Mr. and Mrs. Barbauld, of whom he always spoke with affectionate respect. At the usual age he entered at St. John's College, Cambridge, where he graduated B.A. in 1800, and M.A. in 1803. He was called to the bar at Lincoln's Inn in 1806. Having distinguished himself by his successful advocacy in several causes and trials connected with the liberty of the press, he entered parliament in 1816 as member for Wareham, Dorset. In 1820 he was chosen for Nottingham, which he represented till the dissolution in 1826, and again in the parliaments of 1830 and 1831. In the House of Commons he connected his name with those of Brougham and Burdett in the advocacy of popular freedom, electoral reform, and education. He was particularly active in opposing all the measures of coercion introduced by the existing government for the purpose of suppressing popular meetings.

In 1820 he was appointed solicitor-general to Queen Caroline, and took an active part in conducting her cause before the House of Peers, to the great disadvantage of his own chance of professional advancement. In this position, he so far won the esteem of the citizens of London that they presented him with the freedom of the city, and appointed him their common serjeant. It was not until the year 1828, when the queen's trial was well nigh forgotten, that he obtained his patent of precedence. In 1830 he was appointed attorney-general under the ministry of Earl Grey, and was promoted from that post to the chief justiceship of the King's Bench on the death of Lord Tenterden in November 1832; he was at the same time sworn a privy councillor. In March 1834 he was advanced to the peerage. He presided over the Court of Queen's Bench till March 1850, when he retired on account of ill health. During that period he had made his name more especially known by his memorable decision in the case of 'Stockdale v. Hansard,' in which he ruled, that though parliament is supreme, yet no single branch of parliament is supreme when acting by itself; and that, consequently, the House of Commons could not screen its servants from the legal consequences of their official acts. As a member of the upper house he took a great interest in the abolition of slavery, and in the encouragement of literary and scientific institutions. He was the author of a few small publications, the last of which was a reprint of 'Six Articles from the "Standard," on the Slave Trade, and other subjects.'

As a barrister, he was less distinguished for deep legal knowledge than for tact and address. In him the man triumphed over the advocate, and he won many a doubtful cause by his apparent sincerity and the fervour of his appeal to the sympathies of those whom he addressed. As a judge, he was dignified and impartial; and his judgments were regarded with respect. By his marriage with Theodosia Anne, daughter of the Rev. R. Vevere, rector of Kettering, Northamptonshire, he left a large family. His second son, a captain in the Royal Navy, and captain of the queen's yacht, particularly distinguished himself in the suppression of the slave trade upon the coast of Africa.

DENNER, BALTHASAR, a celebrated German portrait painter, was born in Altona in 1685. Of Denner's early life little is known; he lived some time with a painter at Danzig, and after having distinguished himself at the courts of several German princes, came by the invitation of George I. to London. Here he spent a few years; but he excited more surprise than admiration, and his success not equalling his anticipations he left this country in 1728. After performing various journeys in the north of Europe, and amassing considerable wealth, he died at Rostock, in Mecklenburg, in 1749, or, according to Van Gool, at Hamburg in 1747. Though Denner bestowed more labour upon his pictures than any painter probably ever did, he still contrived to paint a considerable number; some are however more finished than others, but some are finished with a degree of attention to the minutiae incredible to those who have not examined them. In some cases recourse to the magnifying-glass is said to be necessary, to do justice to his laborious execution. Their extraordinary finish is however almost their only, certainly their chief merit. Yet they were in considerable request in their day, and Denner received sums for them at least proportionate to the labour he bestowed upon them. There is the head of an old woman in the gallery of Vienna, for which the Emperor Charles VI. gave him 4700 imperial florins; Denner's own portrait in his forty-second year, in a similar style, is placed near it. There are also two old heads of extraordinarily high finish in the gallery of Munich, said to be the portraits of the artist's father and mother. Denner painted many of the German princes of his day, and three kings, one of whom, Frederic IV. of Denmark, he painted, according to Van Gool, about twenty times; the other two were Peter III. of Russia, and Augustus II. of Poland. (Van Gool, *Nieuwe Schouburg der Nederlantsche Kunstschilders*, &c.)

DENNIS, JOHN, was the son of a saddler of London, where he was born in 1657. Having been put to school at Harrow, he was sent thence in 1675 to Caius College, Cambridge. In 1679 he removed to Trinity Hall, in the same university, and in 1683 took his degree of A.M. There appears to be no foundation for the story told in Baker's 'Biographia Dramatica,' that he was expelled from

college for attempting to stab a person in the dark. On leaving the university he spent some time in travelling through France and Italy. Returning home from the continent, full of dislike to the manners of the people, and especially to the modes of government he had seen there, and finding himself in possession of a small fortune, the bequest of an uncle, he set up for a politician of the Whig school, and formed connexions with several of the leading political and literary characters of that party. As a man of letters however he did not confine his acquaintance within the limits of his political partialities; Dryden and Wycherley, for instance, as well as Halifax and Congreve, are enumerated among his friends. In the idle and expensive life which he now led he soon dissipated what property he had, and for the rest of his life he was obliged to depend for subsistence upon his pen, and the still more precarious resource of private patronage. No experience however seems to have cured his improvidence. In his difficulties the duke of Marlborough procured for him the place of a waiter at the Custom house, a sinecure worth 120*l.* a year; but he was not long in selling this appointment, and it was only the kind interference of Lord Halifax that induced him to reserve out of it a small annuity for a certain term of years. This term he outlived, and, to add to his miseries, he became blind in his last days, so that he was in the end reduced to solicit the charity of the public by having a play acted for his benefit, which some of his old friends, and some also whom he had made his enemies, interested themselves in getting up. Dennis died in 1734. Throughout his life the violence and suspiciousness of his temper were such that he rarely made a friend or an acquaintance in whom his distempered vision did not soon discover an enemy in disguise. Yet Dennis wanted neither talents nor acquirements. Many of his literary productions show much acuteness and good sense, as well as considerable learning. He began to publish occasional pieces in verse, mostly of a satirical cast, about 1690, and from that time till near his death his name was constantly before the public as a small poet, a political and critical pamphleteer, and a writer for the theatres. His poems and plays were sufficiently worthless; but one or two of the latter obtained some notoriety chiefly from the fuel they administered to certain popular prejudices that happened to rage at the time. His 'Liberty Asserted,' in particular, was acted with great applause in the Lincoln's Inn Fields theatre in 1704, in consequence of the violent strain of its Anti-Gallicism, a sentiment with which the audience, in the excitement of the war with France, was then peculiarly disposed to sympathise. Connected with this play are the two well-known stories about Dennis, during the negotiations that preceded the peace of Utrecht, going to the Duke of Marlborough and asking his grace to get an article inserted in the treaty to protect his person from the French king; and about his afterwards running away from the house of a friend with whom he was staying on the Sussex coast, because he thought that a vessel he saw approaching was coming to seize him. Another of his dramatic attempts, his 'Appius and Virginia,' acted and damned at Drury Lane in 1709, is famous for the new kind of thunder introduced in it, and which the author, when a few nights after he found the players making use of the contrivance in Macbeth, rose in the pit and claimed with an oath as his thunder. Dennis's thunder is said to be that still used at the theatres.

Among the ablest of his critical disquisitions were his attacks upon Addison's 'Cato,' and Pope's 'Essay on Man.' Addison had been among the number of his friends, but Dennis supposing that something in the second and third numbers of the 'Spectator' was intended as an offensive allusion to him, took the opportunity of avenging himself when 'Cato' appeared. Much of his criticism nevertheless has generally been deemed by no means the product of mere spite. It was upon this occasion that Pope, in conjunction with Swift, wrote 'The Narrative of Dr. Robert Norris, concerning the strange and deplorable Frenzy of Mr. John Dennis, an Officer in the Custom house.' Pope also stuck Dennis in his 'Essay on Criticism,' and afterwards gibbeted him much more conspicuously in the 'Dunciad.'

DENON, DOMINIQUE VIVANT, BARON, was born of a noble family at Châlons-sur-Saône, on the 4th of January 1747. From his early youth his bias was for the arts of design, but he for some years devoted himself to them as an amateur only, and as such was early distinguished for his taste and judgment in matters of virtue; Louis XV. employed him to make a collection of antique gems for Madame Pompadour. He commenced however his active career in life as a diplomatist, and was first attached to the Russian embassy. Upon the accession of Louis XVI. he found a valuable patron in the minister for foreign affairs, the Comte de Vergennes, who sent Denon on a mission to Switzerland, when he took the opportunity of visiting Voltaire at Ferney, and drew a portrait of him, which was engraved by St. Aubin. He was next sent by his patron to Naples, as secretary to the embassy under the Comte Clermont d'Amboise. He lived seven years at Naples, and devoted much of his time to the study of the arts, especially etching and mezzotint engraving. The death of the Comte de Vergennes (1787) caused his recall to Paris, and put an end to his diplomatical career. He thenceforth adopted the arts of design as his profession; and through the influence of his friend Quatremère de Quincy, he was elected a member of the Royal Academy of the Arts. Returning to Italy, he spent five years at Venice, and some time at Florence; and then visited Switzerland, where he learned that his

property had been sequestered, and his name enrolled in the list of emigrants. Notwithstanding this threatening state of his affairs, he ventured to make his appearance at Paris, where, but for the assistance of the painter David, he would have been destitute. David contrived to have his name erased from the list of emigrants, and procured him an order from the government to design and engrave a set of republican costumes. He was engaged in this occupation during the horrors of the Revolution.

After the more violent features of the Revolution had subsided, the house of Madame Beauharnais was a centre of attraction where the most distinguished men in politics, art, literature, and science frequently met; and here Denon became acquainted with Bonaparte. Denon was a most devoted admirer of the great general, and when Napoleon asked him, in 1798, to accompany him on his expedition to Egypt, Denon, though in his fifty-first year, embraced the opportunity with the utmost enthusiasm. He accompanied General Desaix in his expedition into Upper Egypt; and during the whole stay of Napoleon in the East he was indefatigable in drawing all the most interesting and striking Egyptian monuments. He returned with Napoleon to France, and in the short space of about two years published his great work on Egypt—'Voyage dans la Basse et la Haute Egypt, pendant les Campagnes du Général Bonaparte,' 2 vols. folio, 1802; a second edition in 4to was published in the same year, and a smaller edition in 1804. A very elegant 4to edition was published in London, in 1802, by M. Peltier, with several appendices by various members of the Egyptian Commission, or Institut du Caire, in addition to Denon's journal, the original text. This work, which, as the production of an individual, is a noble monument of zeal, industry, and ability, professes to be simply descriptive of what Denon saw and what happened to him; he designedly abstained from all hypothesis, whether with reference to origin, object, or principle. About the time of the publication of this work, Denon was appointed by Napoleon directeur-général des Musées, a post of great influence, and one for which he was well fitted. Denon accompanied Bonaparte in the campaigns of Austria, Spain and Poland, and is said to have made his sketches from the most exposed place on the field of battle. To Denon was assigned the duty of pointing out to the emperor the principal objects of art which it was desirable to select from the various conquered cities for the imperial collections in the Louvre. At the Restoration Denon was dismissed from his post as directeur-général des musées. In his retirement, he occupied himself in preparing a general history of art, for which he prepared, by the assistance of able artists, many lithographic drawings, but he did not live to complete the text. The incomplete work was published by his nephews, in 1829, in 4 vols. folio, under the title 'Monumens des Arts du Dessin, chez les peuples, tant anciens que modernes, recueillis par le Baron de Denon, pour servir à l'Histoire des Arts,' &c. Denon died at Paris in 1825.

Denon's etchings are numerous, amounting to upwards of 300; they are chiefly in imitation of the style of Rembrandt, and consist of portraits, historical and genre pieces, from Italian and Flemish masters. Besides his Voyage in Egypt, he is author of the following literary productions:—'Julie ou Le Bon Père,' a comedy in three acts, 1769; 'Voyage en Sicile et à Malte,' 1788; 'Discours sur les Monumens d'Antiquités arrivés d'Italie,' 1804; several biographical notices of painters in the 'Galerie des Hommes célèbres,' and 'Point de Lendemain,' a tale, 1812.

He was Membre de l'Institut, of the class of fine arts, officer of the Legion d'Honneur, and knight of the Russian order of St. Anne, and of the Bavarian crown. He was created baron by Napoleon.

(*Kunstblatt*, 1825; *Biographie Universelle*, Suppl.)

DENTATUS, the surname of the Roman consul Curius, who defeated king Pyrrhus near Tarentum. He is said by Pliny to have been born with teeth, and to have received the name Dentatus from this circumstance. He gained several victories over the Samnites, Sabines, and others, and was remarkable for his great frugality. When the ambassadors of the Samnites went with a quantity of gold to attempt to bribe him, they found him cooking some vegetables on his fire, and were dismissed with the reply, that he preferred ruling the rich to being rich, and that he who could not be conquered in battle was not to be corrupted by gold. (Horat. 'Od.' i. 12, 41; Florus, i. 15.)

DENTATUS, LUCIUS SICIPIUS, a Roman tribune, who distinguished himself in battle chiefly against the Æqui and the Sabines. Livy calls him Lucius Sicius (iii. 43). According to Valerius Maximus (iii. 2), he had been in 120 engagements, had forty-five wounds in the breast, and had received an accumulation of honours almost incredible. Through the jealousy and treachery of Appius Claudius he was murdered by the soldiers whom he was appointed to command. He no sooner perceived their design than he stood with his back to a rock, and drawing his sword, killed fifteen of his assailants, and wounded thirty more: at length they ascended the rock, and overwhelmed him with stones from above. On their return to their camp they gave out that they had engaged with the enemy, and that Sicius had fallen in the battle. (Dionys. Halicarnassensis, x.; Livius iii. 43.)

DÉPARCIEUX, ANTOINE (often written, but erroneously, De Parcieux), an able mathematician, was born on the 18th of October 1703, at the village of Cessoux, near Nismes. His father was an humble peasant, and unable to afford him the least education; but

the display of his precocious talents induced an opulent gentleman in his neighbourhood to place him in the College of Lyon, where his progress in his studies was rapid and striking, especially in the mathematical branches of science. After finishing his course in this institution he repaired to Paris, without money and without friends; but he turned his talents to account by drawing sun-dials, and engaging in other employment of this kind, by which he was able to obtain a subsistence. His accuracy in these drawings being remarkable, he at length acquired an attachment to the pursuit, and obtained ample employment to secure him a comfortable livelihood. He afterwards appears to have turned his attention to machinery, and probably his talents were extensively employed in civil engineering and other collateral subjects. He died September 2, 1768, aged 65.

His publications were as follows:—1, 'Tables Astronomiques,' 4to, 1740; 2, 'Traité de Trigonometries Rectiligne et Sphérique, avec Traité de Gnomonique et des Tables de Logarithmes,' 4to, 1741; 3, 'Essai sur les Probabilités de la Durée de la Vie Humaine,' 4to, 1746; 4, 'Réponse aux Objections contre l'Essai' (the last work), 4to, 1746; 5, 'Additions à l'Essai,' &c., 4to, 1760; 6, 'Mémoires sur la Possibilité et la Facilité d'amener auprès d'Estrapade à Paris les Eaux de la Rivière d'Ivette,' 4to, 1765. Besides these separate works he published sixteen memoirs amongst those of the Paris Academy, between the years 1735 and 1768.

Deparcieux was created Royal Censor and member of the Academy of Sciences in Paris. He was also a member of the academies of Berlin, Stockholm, Metz, Lyon, and Montpellier.

DEPPING, GEORGE BERNARD, was born at Münster, May 11, 1784. Having completed his educational course, he visited Paris in 1803, when, forming acquaintances there, and observing the facilities which the city afforded for the prosecution of literary studies, he determined to make it his permanent residence. The rest of his life was spent there in the uneventful career of a busy littérateur. He was naturalised in 1827.

For many years M. Depping mainly occupied himself in preparing juvenile and popular works chiefly on geographical subjects, in translating, and in writing for magazines and encyclopædias. His first important original work was one written for a prize offered by the Institute on the 'Expéditions Maritimes des Normands en France au Dixième Siècle.' It won the prize, was printed in 1826, and revised in 1844: it is a work of sterling value, and contains the fruits of extensive researches in Scandinavian literature. A more important work, for which this had prepared the way, was his 'Histoire de la Normandie,' from the Conqueror to the re-union of Normandy with France (1066 to 1204), 2 vols. 8vo, 1835. Among his other more important works may be named—'Histoire du Commerce entre le Levant et l'Europe, depuis les Croisades jusqu'à la Fondation des Colonies d'Amerique,' 2 vols. 8vo, Paris, 1830; 'Les Juifs dans le Moyen Age, essai historique sur leur État Civil, Commercial, et Littéraire,' 8vo, 1840; 'Règlements sur les Arts et Métiers, rédigés au Treizième Siècle, et connus sous le nom de Livre des Métiers d'Etienne Boileau,' &c., 4to, 1837; 'Geschichte des Kriegs der Münsterer und Kölner . . . 1672-1674,' 8vo, Münster, 1840; 'Correspondance Administrative sous le Règne de Louis XIV.' (forming vols. i. to iii. of the 'Collection des Documents Inédits de l'Histoire de France'), 4to, 1850-53; 'Romancero Castellano,' 1 vol. 12mo, Paris, 1817, and, greatly enlarged, 2 vols. 12mo, Leipzig, 1844. Some of the above works have been translated into German and Dutch, while several of his juvenile works have been translated into most of the European languages. M. Depping wrote many of the more important articles in the 'Biographie Universelle,' 'L'Art de Vérifier les Dates,' &c. He died at Paris, September 5, 1853.

* DE QUINCEY, THOMAS, one of the most remarkable English writers of the 19th century, was born in Manchester in or about the year 1786. He was the fifth child and second son of a family of eight, born to his father, a Manchester merchant in wealthy circumstances, who died while his children were yet young, leaving to his widow for their education a clear fortune of 1600*l.* a year. Although the name De Quincey looks as if it were of French extraction, the family is an old English one—as old as the Conquest. After receiving his first education at his home near Manchester, De Quincey was sent at the age of twelve to the Grammar school of Bath, the head master of which at that time was a Dr. Morgan. Here he remained till his fifteenth year, laying the foundation of his extensive and miscellaneous learning in the studies of the school and in private readings of his own in English and other authors. From 1800 to 1803 the boy spent his time partly at another school, partly in visits to friends in different parts of England and Ireland. From 1803 to 1808 he was at the University of Oxford; and it was during this time that he first contracted the habit of opium-eating, of which, in connection with the peculiarities of his life and genius, he has himself made such proclamation to the world. Of his eccentricities during this period he has given an account in his 'Confessions of an English Opium-Eater.' It was in the year 1807 that he first made the acquaintance of Coleridge, Wordsworth, and Southey; and on quitting college in 1808 he took up his abode at the Lakes, and became one of the intellectual brotherhood there constituted by these men. Wilson was a resident at the Lakes about the same time. The difference between De Quincey and the Lakists was, that his element was exclusively prose. Like Coleridge, but with peculiarities sufficient

to distinguish him from that thinker, he philosophised and analysed, and speculated, in sympathy with the new literary movement, of which the Lake party was a manifestation. He resided ten or eleven years at the Lakes; and during these ten or eleven years we are to suppose him increasing his knowledge of Greek, of German, and of universal history and literature. In point of time De Quincey preceded Carlyle as a literary medium between Germany and this country; and some of his earliest literary efforts were translations from Lessing, Richter, and other German authors. These literary efforts, begun while he was still a student at the Lakes, were continued with growing abundance after he left them (1819). From first to last, to a degree hardly paralleled in any other instance where equal fame has been attained, Mr. De Quincey's literary career has been that of a writer for periodicals. First at the Lakes, then in London, then in other parts of England, then again and again in London, and lastly in Scotland, where he has resided with his family almost continually since 1843 (at Lasswade, a small village near Edinburgh), he has sent forth a succession of papers, in various British periodicals, ranging over an immense variety of subjects, and all so original and subtle, that, being traced to him, they have made his name illustrious. Among the periodicals to which he has contributed may be mentioned the 'London Magazine,' so celebrated about 1822-4, under the editorship of John Scott; 'Blackwood's Magazine,' which began in 1817, and in whose famous 'Noctes Ambrosianæ,' written by Wilson, De Quincey is made occasionally one of the colloquists; the 'Encyclopædia Britannica'; 'Tait's Edinburgh Magazine'; and the 'North British Review.' With the exception of 'The Confessions of an English Opium-Eater,' which, after having appeared in parts in the 'London Magazine,' were published separately in the year 1822; and a work, entitled 'The Logic of Political Economy,' published at Edinburgh in 1844, Mr. De Quincey had until recently issued nothing openly in his own name. He was, in fact, buried and scattered in the British periodical literature of his generation; and though his admirers kept a register of his principal articles, they had to rummage for them in old numbers of reviews and magazines. As has happened in other cases, it was in America that the idea of a republication of Mr. De Quincey's writings in a collected form, was first carried into effect. Between 1851 and 1855 a Boston house (co-operating we believe with the author) gathered together his papers from all sorts of periodicals, and gave them to the trans-Atlantic public in their aggregate. This edition consists of no fewer than eighteen volumes; and it is impossible for any one who has not glanced over the contents of these eighteen volumes to form an idea of Mr. De Quincey's versatility, or of the total amount of matter that has proceeded from his pen.

Mr. De Quincey has begun an issue of his complete works in this country; but of this issue, only four or five volumes have as yet (1856) been published. In the preface to this edition, however, Mr. De Quincey makes a classification of his writings, which it is useful to remember. The immense medley, which, in the American edition, is arranged on the loosest possible principle, may be distributed, he says, in the main, into three classes of papers:—first, papers whose chief purpose is to interest and amuse (autobiographical sketches, reminiscences of distinguished contemporaries, biographical memoirs, whimsical narratives, and such like); secondly, essays of a speculative, critical, or philosophical character, addressing the understanding as an insulated faculty (of these there are many); and thirdly, papers belonging to the order of what may be called 'prose-poetry'; that is, phantasies or imaginations in prose (of which class Mr. De Quincey cites the 'Suspensio Profundis,' originally published in Blackwood, as the most characteristic specimen). Under any one of the three aspects here indicated Mr. De Quincey must rank high in the entire list of British prose-writers. His papers of fact and reminiscence, though somewhat discursive, are among the most delightful in the language; and his essays have the merit of extraordinary subtlety of thought and of invariable originality. Undoubtedly, however, his papers of prose-phantasy are the most splendid manifestations of his genius. Mr. De Quincey himself speaks of them as "modes of impassioned prose, ranging under no precedents that I am aware of in any literature;" and, as such, claims for them more "in right of their conception" than he will venture to do in right of their "execution." Whether one agrees with him or not as to the "utter sterility of universal literature in this one department of impassioned prose," one must admit that his own contributions to this department, or rather to the department of subtle-imaginative prose, are, as far as our literature is concerned, almost unique in their kind. They are often of such a weirdly and visionary character as to give an additional significance to the circumstance of his being universally known as "the English Opium-eater."

* DERBY, EDWARD-GEOFFREY SMITH STANLEY, 14TH EARL OF, born March 20, 1793, was the eldest son of Edward Smith, Lord Stanley, afterwards 13th Earl Derby, but then only heir-apparent to his father, the 12th Earl. After quitting Christ Church, Oxford, where, as well as at Eton, he was greatly distinguished, Mr. Stanley entered the House of Commons in 1820 as member for Stockbridge. It was not till 1824 however that he began to take an active part in the business of the House. From the moment that he did so his pre-eminent powers as a parliamentary debater gave him an acknowledged right to lead; and these powers, together with his high

connections, have enabled him ever since to be, whether in or out of office, one of our foremost political men. From 1826 to 1830 he sat as member for Preston. In this latter year, having been nominated to the post of Under-Secretary for the Colonies under the short Goderich administration, he was thrown out by the constituency of Preston, who elected the democratic favourite Henry Hunt in his stead. He found a seat however in Windsor, which was vacated by Sir Hussey Vivian in his favour. He sat for Windsor till 1832, when he was elected for North Lancashire; which county he continued to represent during the remainder of his stay in the Lower House. The death of his grandfather in 1834, by raising his father to the earldom, devolved on him the courtesy-title of Lord Stanley. This same year brought about a change in his political relations. Since 1830 he had been officially attached to the Reform ministry of Lord Grey—first as Chief Secretary for Ireland (1830-33), and then as Secretary of State for the Colonies (1833-34); and in both capacities he signalled himself by his energy and his eloquence. During the Reform Bill debates, in particular, his services as a speaker on the reform side were of the first order. In 1834 however he, along with Sir James Graham, the Duke of Richmond, and Lord Ripon, separated from Earl Grey, on the question of the farther reduction of the Irish Ecclesiastical Establishment. Since that time accordingly he has taken part in British politics uniformly as a Conservative. In 1841 he took office in Sir Robert Peel's Conservative ministry, in his old post of Colonial Secretary; and of this ministry he was an active member till 1845. In order that the ministry might have the advantage of his services in the Upper House, he was in 1844 raised to that House by the change of his courtesy-title of Lord Stanley into the real title of Baron Stanley of Bickerstaffs. Shortly after this elevation, Sir Robert Peel's growing determination towards a free trade policy effected a separation between him and Lord Stanley. No sooner had Sir Robert carried the repeal of the Corn-Laws, than his colleague placed himself at the head of what has since that time been known as the Protectionist party. The efforts of this party, with such men as Lord Stanley, Lord George Bentinck, and Mr. Disraeli to lead them, were directed to the disorganisation both of the Whigs and of the Peelite Conservative party; and with such success that, at length, on the dissolution of the Whig Cabinet of Lord John Russell in February 1852, the Protectionist Conservatives were called into office. Of this ministry the Earl of Derby (raised to that rank by the death of his father, June 30, 1851), was the First Lord, with Mr. Disraeli for Chancellor of the Exchequer and leader in the Commons. The ministry lasted till December 1852; but during its ten months of office did not carry any measures of a peculiarly Protectionist character. Defeated on the financial policy of Mr. Disraeli in December 1852, Lord Derby resigned, and Lord Aberdeen and the Coalition ministry came into office. On the fall of this ministry in 1855 Lord Derby had another opportunity of constructing a Protectionist ministry, but he declined the task, on the ground that, in the existing state of parties, no ministry that he could form could stand its ground. Accordingly, at the present moment (1856), Lord Derby's position in the politics of his country is that of leader of a general, rather than a strictly Protectionist, opposition to the policy of Lord Palmerston. The conduct of the war with Russia and the management of the negotiations for peace (March 1856), have afforded the most recent materials for debate to Lord Derby and his associates. Among other honours held by Lord Derby is that of Chancellor of the University of Oxford: he has also been Lord Rector of Glasgow University. He married in 1825 Emma Caroline, daughter of the first Lord Skelmerdale, and has three children; of whom the eldest, Lord Stanley, M.P. (born 1826), is heir-apparent.

DERHAM, REV. WILLIAM, D.D., an eminent English divine and philosopher, was born at Stowton, near Worcester, in November 1657, and received his early education at Blockley in the same county. He was admitted of Trinity College, Oxford, in 1675. Having completed his academic studies, he was ordained, and in 1685 was instituted in the vicarage of Wargrave in Berkshire; and four years afterwards to the valuable rectory of Upminster in Essex, where he spent the remainder of his life. To this residence he was much attached; mainly because it gave him, by its contiguity to London, ample opportunities of associating with the scientific men of the metropolis. He was made canon of Windsor in 1716, and in 1730 he received from his university the diploma of D.D. He devoted his attention, with great earnestness, to natural and experimental philosophy. He was enrolled a member of the Royal Society; and he contributed a considerable number of memoirs to its Transactions. These papers prove him to have been a man of indefatigable research and careful observation.

His first publication was the 'Artificial Clock-Maker,' which has gone through three or four editions, and is considered a useful manual even now. In 1711, 1712, and 1714, he preached those sermons at Boyle's Lecture which he afterwards expanded into the well-known works 'Physico-Theology' and 'Astro-Theology,' or a demonstration of the being and attributes of God from the works of creation and a survey of the heavens, enriched with valuable notes, and good engravings after drawings of his own. His next separate work was 'Christo-Theology,' or a demonstration of the divine authority of the Christian religion, being the substance of a sermon preached in the Abbey

Church of Bath, in 1729. His last published work of his own was entitled 'A Defence of the Church's Right in Leasehold Estates,' written in answer to a work entitled 'An Inquiry into the Customary Estates and Tenant-rights of those who hold lands of the Church and other Foundations.' It was published in the name of Everard Fleetwood.

Dr. Derham also published some of the works of the naturalist Ray, of which he had procured the manuscripts; and to him the world is indebted for the publication of the philosophical experiments of Dr. Hook. He also gave new editions of other of Ray's works, with valuable editions, original, and from the author's manuscripts; besides editing other works of value, amongst which was the 'Miscellanea Curiosa,' in 3 vols. small 8vo.

A considerable number of his papers were printed in the 'Philosophical Transactions,' from the 20th to the 39th volume inclusive, the principal of which are: 1, 'Experiments on Pendulums in Vacuo.' 2, 'Of an Instrument for finding the Meridian.' 3, 'Experiments and Observations on the Motion of Sound.' 4, 'On the Migration of Birds.' 5, 'On the Spots on the Sun from 1703 to 1711.' 6, 'Observations on the Northern Lights, 8th October 1726, and 13th October 1728.' 7, 'Tables of the Eclipses of Jupiter's Satellites.' 8, 'Difference of Time in the Meridian of Different Places.' 9, 'On the Meteor called Ignis Fatuus.' 10, 'The History of the Death-watch.' 11, 'Meteorological Tables,' for several years.

Dr. Derham was of an ungainly appearance, small stature, and distorted form. He was not only the moral and religious benefactor of his parishioners, and of all those who came in his way, but he was likewise their physician in sickness, and their pecuniary friend in all their difficulties. He died at his rectory in 1735.

DERRICK, SAMUEL, was a native of Ireland, and born in 1724. He was first a linen-draper in Dublin, then tried the stage, but not succeeding in either of those occupations, became professionally an author in London. A life of irregularity and debauchery introduced him to some fashionable acquaintances, whose influence procured his appointment to succeed Beau Nash, in 1761, as master of the ceremonies at Bath and Tunbridge. His extravagant habits remained with him there, and he died very poor, in March 1769. His avowed literary works are of little importance; they include 'Fortune, a Rhapsody,' 'A View of the Stage,' 'Letters from Liverpool, Chester, &c.:' an edition of Dryden, which did more credit to the printer than to the editor; and a translation of the third Satire of Juvenal. It ought to be mentioned that Johnson, who knew Derrick, always speaks of him with kindness; and Boswell records that Derrick was his "first tutor in the ways of London . . . both literary and sportive."

DERZHAVIN, GABRIEL ROMANOVITCH, the most distinguished lyric poet of Russia, was born at Krasn, 3rd July 1743. After completing his education in the Gymnasium of that city, he commenced the usual military career by entering, in 1760, the engineer service, in which the attention he gave to his mathematical studies soon obtained for him promotion. He did not, however, rise to the grade of lieutenant until 1774, when he was sent with his corps to reduce the rebel Pugachev, on which occasion he displayed much bravery and address. He continued to advance in military promotion; but quitted the service on being appointed, in 1784, a councillor of state, and afterwards governor of Olonetz and of Tambov successively. In 1791, Catharine bestowed on him the office of secretary of state; in 1793 he was called to the senate, and the following year was made president of the college of commerce. Various other appointments followed, the last of which was that of minister of justice, in 1802: from which he retired the following year, on a full-pay pension. He died 6th July 1816.

It was during the busiest portion of his career, both military and official, that the finest of his odes were produced. Pre-eminent among these, and perhaps hardly surpassed by any similar composition in any other language, is his 'Oda Bog,' or, 'Address to the Deity,' a piece full of sublimity both as regards the ideas and expressions. Indeed, elevation of conception and nobleness of sentiment, no less than great energy and mastery of language, are striking characteristics of Derzhavin's poetry; and if occasionally more negligent than Lomonosov, it is because he is borne away by the intensity of his feelings. On the other hand, he manifests greater freshness, originality, and richness than his predecessor; and while he delights by the eloquence of his lyre, he elevates and purifies the soul by the moral grandeur of his strains. In the art of which he was so profound a master, he has shown himself no less able as a theorist and critic by his treatise on Lyric Poetry, printed in the 'Tchenie v Beseda,' a miscellany edited by a society for the cultivation of the Russian language. Besides the essay just mentioned, he wrote some other works in prose, among which is a 'Topographical Description of the Government of Tambov.' A collection of his works was first printed in 1810, in four volumes; to which was added another, shortly before his death.

DESAGULIERS, JOHN THEOPHILUS, D.D., was born at Rochelle on the 12th of March 1683, and brought to England while an infant by his father the Rev. John Desaguliers, a French Protestant refugee, after the revocation of the edict of Nantes. His early education he owed to the instructions of his father, who appears to have been a very respectable scholar and sound divine, and at an early age he was sent to Christchurch, Oxford. In 1702, being then only nineteen, he succeeded Dr. Keil in reading lectures on Experimental

Philosophy at Hart Hall; and he ever afterwards prosecuted his physical researches with great earnestness and success. Upon his marriage in 1712, he settled in London, where he was the first that introduced the reading of lectures to the public on natural and experimental philosophy. This he did with great and continued reputation to the end of his life, which terminated in 1749, in the sixty-sixth year of his age. The highest personages were attracted by the novelty of his mode of teaching; and he was several times honoured with reading his lectures before the king and royal family.

In 1714 Desaguliers was elected a Fellow of the Royal Society, of which he proved a valuable member. The Duke of Chandos appointed him his chaplain, and presented him with the living of Edgeware, near his seat at Cannon; and he was afterwards made chaplain to the Prince of Wales.

From some causes which are not well understood, Desaguliers appears to have fallen into a state of great destitution;—we say appears, for the authority on which the assertion rests has, so far as we know, neither received collateral proof nor denial. He certainly did remove to lodgings over the Piazza in Covent Garden, in which he continued his lectures; but the lines of the poet Cawthorn are the only authority on which the statement of extreme indigence rests:—

"Here poor neglected Desaguliers fell!
How he who taught two gracious kings to view
All Boyle ennobled, and all Bacon knew,
Died in a cell, without a friend to save,
Without a guinea, and without a grave!"

If this statement be true, he must either have been the dupe of others to a great extent, or singularly improvident in his own affairs; as besides his emoluments from his lecturing, he held two church livings.

The separate writings of Desaguliers contain an elegant exposition of the more popular portions of experimental philosophy. His mind was more fitted for the popular and the practical than for the profounder inquiries into those branches of science; and for the geometrical method of investigation than for the higher and then new calculus which has since so completely changed the whole current of research. His works are—1, 'A Course of Lectures on Experimental Philosophy,' 2 vols. 4to, 1734. 2, 'An Edition of Dr. David Gregory's Elements of Catoptrics and Dioptrics, with an Appendix on Reflecting Telescopes,' 8vo, 1735. This appendix contains some original letters between Sir Isaac Newton and Mr. James Gregory relative to these telescopes, which are worthy of attention. 3, 'A Translation of the curious, valuable, and little known Treatise on Perspective,' by S'Gravesande, 8vo. 4, 'A Translation of S'Gravesande's Natural Philosophy,' 2 vols. 4to, 1747. 5, 'A Translation of Nieuwentyt's Religious Philosopher,' 3 vols. 8vo. Several respectable papers by Desaguliers are inserted in the 'Philosophical Transactions' from 1714 to 1743.

DESAIX DE VEYGOUX, LOUIS-CHARLES-ANTOINE, was born on the 17th of August 1768, at St. Hilaire-d'Ayat in Auvergne; his father was a noble, much impoverished, but of ancient descent. In 1776, he was placed at the military school of Effiat, where he remained seven years, and then joined an infantry regiment. While at school he had studied diligently, and even in the garrisons of Briançon and Huningue, where he was quartered on leaving college, he prosecuted his studies with unabated zeal. Those branches which relate to military science occupied him chiefly.

When the Revolution broke out in 1789, young Desaix at once adopted its principles, as they were then understood; but he protested against the proceedings of August 10, for which he was suspended by Carnot, and imprisoned for two months. In the summer of 1792 he became aide-de-camp to Prince Victor de Broglie, in the army of the Rhine. In this capacity he rendered himself conspicuous by his cool but fearless bravery. In 1793 many generals of note were sent to prison as suspected of treachery to the Republic, and seven commanders-in-chief were guillotined. All distinction at that time gave umbrage, and the very esteem of his comrades, and the affection of his soldiers for Desaix, exposed him to great peril; he owed his escape to his consummate prudence; for during the whole Reign of Terror, he rather avoided promotion. But his mother and sister were sent to prison by the Committee of Public Safety. Desaix himself was suspended a second time; but Pichegru reclaimed him for the good of the army, and even Saint Just supported the intercession. Soon after (1794), General Pichegru having been transferred to the army of the North, Desaix would have succeeded to the command of that of the Rhine, but for the suspicions entertained of him as a noble, and his own determination at this period to shun distinction. For the next two years he was employed in defending the Alsatian frontier against the Austrians.

In 1796 Moreau received the command of the army of the Rhine; Desaix, who had remained a general of division since 1793, became his lieutenant, and was employed in the most arduous enterprises. To him was entrusted the passage of the Rhine (January 1796), a most difficult operation, but completely successful. Shortly after, Jourdan's retreat with the army of the Sambre-et-Meuse having exposed Moreau's army to the whole shock of the Austrians under the Archduke Charles, the French commander was compelled to retreat; but his masterly

manœuvres extorted general admiration, and for a time raised the name of Moreau to a level with that of Bonaparte. Desaix commanded the left wing during this retreat, and displayed abilities of the highest order. The French still retained possession of the fort of Kehl, on the right bank of the Rhine; Desaix was ordered to defend it, and arrest the progress of the enemy. Here, amidst broken and ruined fortifications, this energetic officer delayed the advance of the archduke for two months, refusing to capitulate, until January 1797, when all his ammunition was spent. Towards the end of this campaign he was severely wounded, and laid up for three months at Strasbourg. The armistice of Leoben occurred during his confinement.

Desaix, who had watched step by step the memorable campaign in Italy, had conceived the greatest admiration for the genius of Bonaparte, and was desirous of studying his tactics on the actual ground where the battles had been fought. He was sent by Moreau, at his own request, on a mission to that general, whom he joined at Milan. Bonaparte announced, among the orders of the day, "The brave General Desaix is come to visit the army of Italy." Thence dated that close union and friendship which was only terminated by the fatal ball at Marengo, three years later.

The French republic having resolved on the invasion of England, in the beginning of 1798, the conduct of the expedition was entrusted to Bonaparte, General Desaix being appointed quarter-master-general. The command itself devolved upon him for several months, during which he exhibited that energy, activity, and administrative talent, in which he was allowed by his chief to excel all the other republican generals. Some time after, the difficulties and hazards of the invasion caused the enterprise to be postponed; at least as far as concerned Great Britain.

During the campaign in Egypt in 1798 and 1799, the reputation of Desaix rose to its highest point, and the conquest of Egypt has been considered his greatest achievement. With a small band of troops, and no other supplies than were to be found in an uncivilised region, Desaix reduced the whole province to submission in less than a year. The fertility of his resources was incredible; his power of winning and controlling the people he conquered, unprecedented; the inhabitants called him the Just Sultan, whilst his own soldiers compared him to Bayard. Nor did this intelligent commander neglect his own instruction at the same time; he employed the intervals between his battles in visiting all the remarkable places, ruins, and monuments in that ancient land. Having completely subdued Upper Egypt in eight months, he began immediately after a much more arduous labour; he formed a regular government, and opened commercial channels with the Arab tribes. Bonaparte, before leaving Egypt for France, desiring to mark his high sense of these great services, sent Desaix a sword, with this inscription on the blade: "Conquête de la Haute Egypte." He also enjoined his successor, Kléber, to send Desaix back to France in the following November.

Having reached Toulon on the 3rd of May 1800, he was just in time to take part in the battle of Marengo on the 14th of June, when he was killed by a musket-ball during a charge upon the Austrians. His death was instantaneous. The French cohort adopted his two aides-de-camp, Rapp and Savary, on the field of battle. A statue has been erected to Desaix in the Place-Dauphine in Paris.

(Alison; Bourrienne; *Nouvelle Biographie Générale*.)

DESCARTES, RENÉ, was born at La Haye, between Tours and Poitiers, in Touraine, on the 31st of March 1596, and died at Stockholm on the 11th of February 1650, before he had completed his fifty-fourth year.

Descartes was of noble descent, being a younger son of a councillor in the parliament of Rennes. He is one of the many instances of great delicacy of constitution being combined with the highest order of mind. His early education was among the Jesuits, who had, shortly previous, established one of their seminaries or colleges in the neighbourhood of his father's residence at La Flèche; and though Descartes was one of those men who would have educated himself in the absence of all instruction, there can be little doubt that the system adopted in the colleges of the Jesuits was better calculated to develop the peculiar powers of the students than any other which has ever prevailed in modern Europe.

During his course in the college of La-Flèche he contracted a friendship with Marsenne, which continued to the end of the life of that distinguished monk, and this circumstance doubtless tended much to increase the attachment of Descartes to mathematical and metaphysical studies. Algebra was at this time studied by few, and it had acquired but little extent and power as an instrument of investigation; whilst geometry, as it was then cultivated, tended too much to run into a mere deduction of isolated but curious and difficult propositions, without much regard to the general principles upon which their analysis and synthesis depended, or to the nature of the fundamental principles upon which geometrical reasoning was ultimately founded. The comparative novelty of the algebraic methods would give a charm to the study in a mind constituted like that of Descartes; and an examination of its first principles, and the operations of the mind in the actual development of the truths of geometry, would be more likely to arrest his active mind than the mere deduction of curious but necessary consequences. It is easy to conceive that his reading and course of study in the college would be somewhat desul-

tery, and that he often depended more upon his own innate power for going through his exercises than upon the lectures of the professor, or the books which were put into his hands. This character in Descartes was properly appreciated by his friends and tutors. He formed the determination of renouncing all books, and endeavouring to efface from his mind the knowledge which he had been taught, so as to employ the power which he had gained by the discipline of his college only to investigate the fundamental principles of human knowledge *ab initio*. Still this can hardly be thought to be a suddenly-formed resolution. Even allowing this to have been a plan gradually formed, the execution of it was a Herculean task; nor was it unattended with personal danger, as the contemporary history of Galileo sufficiently proves. Considering therefore that Descartes was at this time only nineteen years of age, the whole circumstance is one without a parallel in intellectual history.

Descartes wisely abstained from publishing his views at this time, or indeed his mathematical discoveries, of which there is some probability that he was in possession at this early age; but conformably with the fashion of the age among men of his social and political condition, he engaged in the profession of arms. He served first as a volunteer in the army of Holland, and then in that of the Duke of Bavaria; and he was present at the battle of Prague in 1620, in which he conducted himself with great intrepidity. There is no profession more inimical to the study of abstract science than that of arms, and hence Descartes soon abandoned it for the purer and more honourable career to which his previous studies and native ardour of mind were so admirably adapted. But even during his attachment to the camp he did not neglect his mathematical and philosophical inquiries. It is believed to have been during his stay at Breda that Descartes composed his 'Compendium Musicae,' although it was not printed till after his death. Another circumstance indicative of his devotion to geometry is also narrated in connection with the same campaign, and occurring also at Breda. One day, seeing a group of people surrounding a placard, he found it written in Flemish, a language which he did not understand, and therefore applied to one of the bystanders for an explanation. This person chanced to be Beckmann, principal of the college of Dort, who, wondering that a young soldier should take any interest in geometry—the placard being, in keeping with the practice of the age, a problem proposed as a challenge—explained the problem to him; but is said to have displayed something of the collegiate pedantry which was then so common. Descartes however promised him a solution, which he sent to the principal early next morning.

The cause of his resigning his commission is said to have been disgust at the atrocities which he witnessed in Hungary; but it is more likely that his object was to see the world under a different aspect, which his travelling as a private individual would enable him to do. He visited in succession Holland, France, Italy, and Switzerland, and stayed some time in Venice and Rome. It has often created surprise that while in Italy he did not visit Galileo; and the cause which has been usually assigned was his jealousy of the fame of that father of physics—an assumption which there is reason to fear is too well founded. His repulsive conduct towards Fermat, whose overtures of an amicable correspondence he so long rejected with an appearance of disdain, seems also to intimate the wish of Descartes to reign alone in the circle of his associates, and in the philosophic world altogether.

After completing his travels, Descartes determined to devote his attention exclusively to philosophical and mathematical inquiries; and his ambition was to renovate the whole circle of the sciences. He sold a portion of his patrimony in France, and retired to Holland, where he imagined he should be more free to follow his inclination without the interruptions to which his celebrity in his own country rendered him perpetually liable. His writings however involved him in much controversy, and the vivacity and dogmatism of his temper often led him to treat in a somewhat supercilious manner the greatest men amongst his contemporaries. The personal courage of Descartes was great; and, unlike many valiant writers, he was valiant in the most trying personal dangers.

The fame of Descartes was very great, even in his lifetime; and that not only among the learned, but in the highest circles of society in every part of Europe. When therefore the church rose in arms against the heresy of his philosophy, and he was subjected to much persecution and some danger, he accepted the invitation of Christina, queen of Sweden, who offered him an asylum and complete protection from the bigoted hostility of his enemies. He was treated by the queen with the greatest distinction, and was released from the observance of any of the humiliating usages so generally exacted by sovereigns of those times from all whom they admitted into their presence. The queen however, probably from the love of differing from every one else, chose to pursue her studies with Descartes at five o'clock in the morning; and as his health was always far from robust, and now peculiarly delicate, the rigour of the climate, and the unreasonable hour, which formed such a striking contrast with those to which he had been many years habituated, brought on pulmonary disease, of which he very soon expired, in the fifty-fourth year of his age. The queen wished to inter him with great honour in Sweden; but the French ambassador interposed, and his remains were conveyed for sepulture amongst his countrymen in Paris. Thus fell one of the greatest men of his age, a victim to the absurd caprice of the royal

patron under whose auspices he had taken shelter from the persecutions of the church.

Probably there is scarcely a name on record, the bearer of which has given a greater impulse to mathematical and philosophical inquiry than Descartes. As a mathematician he actually published but little, and yet in every subject which he treated he has opened a new field of investigation. The simple application of the notation of indices to algebraical powers has totally new-modelled the whole science of algebra. The very simple conception of expressing the fundamental property of curve-lines and curve-surfaces by equations between the co-ordinates, has led to an almost total supersession of the geometry of the ancients. The view which he proposed of the constitution of equations is contested as to originality; but admitting, as we do, his claims on this head to be open to dispute, the writings and discoveries of Descartes have laid the foundation for such a change in the general character of mathematical science as renders it extremely difficult for those who have not given very great attention to the older writers to follow the course of reasoning which they employed. The claims of Descartes however to the originality of his views on the composition of equations, and the relation between their roots and their co-efficients, are discussed under the name of his competitor. [HARRIOTT.]

His speculations in physics have often been ridiculed by subsequent writers, and there can be no doubt that they are sufficiently absurd. Still many reasons may be urged in mitigation of that ridicule, and even of the more temperate censure which careful and judicious historians of science have dealt out upon the intellectual character of Descartes. It ought especially to be observed that the theories of all his predecessors were mere empirical conjectures respecting the places and paths of the celestial bodies; they constituted, so to speak, the plane astronomy of those times, in contradistinction to the physical astronomy of ours. Those paths were not deduced as the necessary effect of any given law of force, but as the result of some fixed and unalterable system of machinery invisible to us, and directly under either the control of original accident or the original will of God. Innumerable hypotheses of the nature of this machinery had been framed before the time of Descartes; and he, being dissatisfied with all others, adopted that of an ethereal fluid, which was continually revolving round a centre, like the water in a vortex. This was not so unnatural to a philosopher living before the 'Principia' made its appearance as it would be absurd in any one to contend for it now. We have indeed been too much in the habit of measuring the philosophical sanity of Descartes by the knowledge of our own times—a most unjust test to be applied to the intellectual efforts of any man by his successors. We ought rather to look to what he did accomplish under all the difficulties of his position in respect to the then state of science, than measure him by the efforts which were attended with no beneficial result. He was, however, the first who brought optical science under the command of mathematics, by the discovery of the law of the refraction of the ordinary ray through diaphanous bodies. He determined the law itself, but not as the result of any law of force. This was a later discovery: but Descartes led the way.

His inquiries in the positive philosophy were distinguished by great acuteness and subtlety; and though his theory has not in a direct form obtained many advocates in this country, it has in reality been the foundation of most of the sects which have since risen in every part of Europe. Differing as these systems do so very widely at first sight, this may be considered a paradoxical assertion. It is nevertheless the fact.

The works of Descartes have been collected and reprinted three times. The first: 1, 'Opera Omnia,' 1690-1701, 9 vols. 4to, Amst. 2, 'Opera Omnia,' 1713, also 9 vols. 4to, Amst. 3, 'Opera Omnia,' 1724-26, in 13 vols. 12mo. Paris.

DÉSHOULIÈRES, ANTOINETTE DU LIGIER DE LA GARDE, a French poetess, born of distinguished parents in 1638. Great pains were taken with her education: she learned the Latin, Italian, and Spanish languages, and studied poetry under the poet Heenan, who often assisted her in her juvenile compositions, and polished her verses when defective. Her life was rather a romantic one. In 1651 she married the Sieur Deshoulières, a lieutenant-colonel in the service of the Prince of Condé. She visited the court of Brussels in company with her husband, where she rendered herself suspected by the government, which caused her to be arrested and imprisoned at Vilvorde, near Brussels. Here she passed her time in reading the Bible and the works of the Fathers, until, after eight months, she found means to escape, with the assistance of her husband. They were shortly afterwards introduced to Louis XIV., and Madame Deshoulières was soon esteemed one of the literary ornaments of the age. Not only did she write a variety of poems herself, but she was an object of adoration to the contemporary poets, who honoured her with the title of the tenth muse. Racine and Pradon having each written a tragedy on the subject of Phœdra, Madame Deshoulières brought upon herself some discredit by taking the part of the latter against the former, in ridicule of whom she composed a satirical poem. Racine, however, soon had his revenge, for Madame Deshoulières brought out a tragedy which met with nothing but ridicule, and afforded him an opportunity of writing a parody. She wrote several other dramatic pieces, but totally without success. The death of her husband, to whom she was greatly attached, was the occasion of one

of her most popular Idyls; indeed her fame rests on her Idyls alone, the rest of her works having fallen into oblivion. She died in 1694, leaving a daughter, Antoinette-Thérèse Deshoulières (born 1662, died 1718), who obtained some celebrity as a poetess, and whose works are often bound up with those of her mother.

La Harpe, after saying that the Idyls are the only works of Madame Deshoulières worth noticing, limits his commendation to three of them. He justly censures her for treating books, flowers, &c., as if they were living persons. Thus, for instance, she envies a streamlet for bearing fish without pain to itself, and asks it why it murmurs when it is so happy? However, her little poem of 'Les Oiseaux,' cited in La Harpe's 'Cours de la Littérature,' is written with great lightness and elegance, and fully deserves the commendations bestowed on it by that severe though impartial critic.

DESMAHIS, JOSEPH-FRANÇOIS-ÉDOUARD DE CORSEM-BLEU, was born in the year 1722, at Sully-sur-Loire. His father designed him for the law, but he devoted himself to poetry, and at the age of eighteen went to Paris, where he was well received by Voltaire, and admitted into high society. He distinguished himself by a number of little poems, which enjoyed a considerable reputation in their day, but which, as most of them are suited to particular persons and occasions, and moreover are filled with mythological allusions, have little interest at present. The Greek mythology was put to a peculiar use in the days of Louis XIV. and those of our own Queen Anne: poems were written altogether in the court taste, and yet perpetual references were made to pagan gods; not the slightest attempt however being made to write in the true spirit of the Greeks. Hence a variety of little works, which acquired a great reputation during the reign of a certain fashion, have fallen into oblivion on that fashion having passed away. The poems of Desmahis are precisely of this class. He wrote some comedies, of which 'L'Impertinent' was very successful in its day, but which soon passed into oblivion. Desmahis was greatly blamed for the articles 'Fat' and 'Femme' in the 'Encyclopédie.' Instead of writing something that contained information, he made two satirical essays in the style of Rochefoucauld. He died in 1761.

DESMOULINS, CAMILLE, was born at Guise, in Picardy, in 1762. His father having obtained for him a free education at the college of Louis le Grand, in Paris, he commenced his studies there in 1776. At this public school he met with Robespierre, when an intimacy was formed which lasted for eighteen years, and this friendship, in the sequel, twice screened him from prosecution. He finished his course of education by the study of the law, and was admitted as an advocate to the parliament of Paris. Having embraced with ardour the new principles of liberty, and issued from time to time several inflammatory pamphlets—'La Philosophie au Peuple Français,' appeared in 1788, and 'La France Libre' in 1789—these political appeals at once brought him into notice as a bold reformer; and they contain many of the germs of that socialism which has been more recently formed into a doctrine.

On the 12th of July 1789 young Desmoulin, in the garden of the Palais-Royal, harangued the people on the dismissal of Necker, and other exciting topics of the day; described with extreme exaggeration the conduct of the court, and gave the first signal of revolt by brandishing a sword and discharging a pistol. He then invited all the bystanders to arm themselves like him, if they did not wish to perish in a new massacre of St. Bartholomew, which was impending. In the heat of this address he tore off a small twig from one of the trees—an example which was followed by most of the multitude. This led to the immediate adoption of the green ribbon as the national cockade, afterwards replaced by the tricolor. He then moved out of the garden, and, followed by thousands, instigated them to that pillage of arms which prepared the way to the capture of the Bastille on the 14th.

Camille Desmoulin being afflicted with a most indistinct utterance, which degenerated into a stutter when he was unusually excited, was continually driven to his pen to proclaim his opinions. His next pamphlet was 'La Lanterne aux Parisiens,' a violent attack on all those who were averse to the revolution. He now adopted the title of 'Attorney-General to the Lantern,' in reference to the summary executions in the streets, when the mob took the law into their own hands, and hung up those they considered their opponents by the long ropes to which the lamps were suspended. This was followed by a serial publication in numbers, called 'Les Révolutions de France et de Brabant,' which had great influence on the progress of events. On the 2nd of August 1790, in the *Assemblée Constituante*, Malouet called attention to the malicious misrepresentations of this demagogue, and concluded his denunciation in these words: "Let him excuse himself, if he dare." "So I do dare!" exclaimed Desmoulin, who was in one of the galleries. This turbulent politician had been a visitor at the Palais-Royal, and a constant guest at the table of the Duke of Orléans before the revolution, and had met Mirabeau, Petion, Danton, and Barrère in these saloons, where the first riots had been anticipated, and discussed, and organised with funds supplied by the prince. Incapable of taking the lead himself, he first attached himself to Mirabeau, and after the death of that great tribune he became the instrument of Danton. In 1791 he married Lucile Duplessis, an illegitimate daughter of one of the chief officers in the household of the Duke of Orléans:

the two Robespierres, Danton, Petion, and a great number of republicans were present at the ceremony.

Desmoulin was one of the chief instigators of the insurrection of the 10th of August 1792, and appeared among the insurgents during the storming of the Tuileries. He was likewise implicated in the massacres of September, as well as Danton, but he succeeded in saving several valuable lives. Notwithstanding his defective utterance he became a member of the National Convention, and voted for the death of Louis XVI.

No man perhaps contributed more than Camille Desmoulin to the fall of the Girondists; his 'Histoire des Brissotins,' which professed to unmask their schemes and objects, had as much influence on the destruction of that party as the denunciations from the Mountain, or ultra-republican party. This powerful satire contained a remorseless retrospect of the early life of Brissot, their leader, and in it was comprised all the worst calumnies which had been invented against Brissot for the preceding four years. After the execution of the Girondists, Desmoulin attacked the faction of Hébert in the same manner, and never desisted until he had sent them to the guillotine. Fatigued at length of so much slaughter he wanted to stop the impetus of the Revolution, and united his efforts with those of Danton and Lacroix, to propose a new course of moderation and indulgence. In the beginning of 1794 he published 'Le Vieux Cordelier,' advocating these new principles; but his exuberant fancy and irrepressible spirit of railery carried him beyond the limits of prudence, and in one passage that ridicule touched the dictator. This act of rashness cost him his life. Robespierre, who felt no animosity towards those whom he did not fear, intended to overlook this folly, and proposed to burn the last number of Camille's work. "Bruler n'est pas répondre," cried the unfortunate man. Then his school companion withdrew his shielding hand, the Committee of Public Safety ordered his arrest, he was carried to the cells of the Conciergerie on the 30th of March, and executed with the Dantonists, April 5, 1794. During his transit in the fatal tumbril he was in a state of extreme excitement, reminding the people that he had called them to arms on the 14th of July. He was almost naked when he reached the scaffold. His wife Lucile was executed soon after.

(Thiers; *Biographie Universelle*; Rabbe; Michelet.)

* DESNOYERS, AUGUSTE-GASPARD-LOUIS-BOUCHER, BARON, a celebrated French line engraver, was born at Paris on the 20th of December 1779. Under Lethière, at the Academy, and as assistant to M. Darcis, he made such rapid progress that in his seventeenth year he was employed to execute works on his own account. A 'Venus désarmant l'Amour,' after R. Lefevre, obtained him a prize of 2000 francs at the Exposition of 1799. In 1801 he received a commission from Messrs. Morel d'Arleux and Foubert to engrave Raffaele's 'Belle Jardinière' in the gallery of the Luxembourg. This was really the turning point in his career. Although far inferior to many of his subsequent works, M. Desnoyers showed in this plate that he could really appreciate the refinement and elevation of the greatest of painters, and faithfully render his characteristics. He now found ample employment, but though he continued to engrave from the pictures of the leading French artists, especially Ingres and Girard, it was to Raffaele that he really dedicated his burin, and beyond any of his countrymen he has succeeded as an engraver of the works of Raffaele. His chief engravings after Raffaele are (to give the French titles) 'La Vierge au Donateur,' 'La Vierge au Linge,' 'La Vierge à la Chaise' (an exquisite version), 'La Vierge au Poisson,' 'La Visitation,' 'Ste. Catharine,' 'La Vierge d'Albe,' 'La Vierge au Berceau,' 'La Belle Jardinière de Florence,' and the 'Transfiguration'—a magnificent work, for which he went to Rome to make the copy. His engravings from Raffaele are marked by great purity of style, a clear and delicate line, and a considerable feeling: perhaps no other living engraver has on the whole rendered the works of Raffaele so admirably. M. Desnoyer has also engraved several of the works of Leonardo da Vinci, Poussin, and others of the great masters. During the reign of Napoleon I. he was several times called on to engrave court-portraits of the Emperor and of the Empress Marie-Louise.

M. Desnoyers was elected a Member of the Institute in 1816; appointed chief engraver to the king in 1825; created baron in 1828; and an officer of the Legion of Honour in 1836.

(Sauzay, in *Nouv. Biog. Gén.*)

DESSALINES, JACQUES, a negro from the Gold Coast of Africa, was imported into the French colony of St. Domingo as a slave. Having become free like all his fellow slaves by a decree of the Convention, 4th of February 1794, he soon figured among the foremost in the insurrection of the blacks against the white colonists. He attached himself to the negro chief, Toussaint l'Ouverture, who made him his first lieutenant. His intrepidity, his extreme activity and quickness of movements, distinguished him in the war against the French troops, and particularly against Generals Rigaud and Leclerc in 1802. After Toussaint's capture by the French, Dessalines submitted for awhile, and accepted an amnesty, but he was in a short time at the head of a new insurrection against General Rochambeau, Leclerc's successor, and contributed greatly to the victory of the blacks at the battle of St. Marc, which decided the evacuation of the island by the French in October 1803. Dessalines encouraged a general massacre of the whites, without distinction of age or sex.

In 1804 he had himself proclaimed emperor of Haiti, under the name of Jacques I., and established his court in imitation of that which Bonaparte had just formed in France. But his cruelty and arbitrary conduct towards his former comrades led to a conspiracy, at the head of which were the negro chief Christophe, and Pethion, a mulatto. They rose upon Dessalines at a review, in October 1806, and killed him on the spot. Christophe succeeded him as emperor of Haiti, by the name of Henri I.

DESTOUCHES, PHILIPPE-NERICAULT, was born at Tours, in 1680. He much displeased his relations by turning actor, when they had designed him for the law. He wandered from town to town as director of a company of comedians, among whom he was distinguished by his strict morality and his great regard for religion. His first dramatic piece, 'Le Curieux Impertinent,' (founded on the episode of the same name in Don Quixote) was acted in 1710, and received with enthusiastic applause. Three pieces which followed seem to have had more success than they merited. In 1717 Destouches accompanied Cardinal Dubois to England, where he married an English Roman Catholic lady, with whom on his return to France he retired to an estate in the country, where he passed nearly all the remainder of his life. In 1723 he was chosen a member of the Academy. About this time commenced his great reputation as a dramatist, for though his former pieces had been successful, they rose little above mediocrity. His 'Philosophes Mariés' raised him to a high rank among the comic writers of France, and the envious critiques which were written against it only showed how highly it was valued. 'Le Glorieux,' which followed, was by some critics considered even superior to 'Le Philosophe Marié,' and La Harpe seems to be of this opinion. He continued to write for the stage till his sixtieth year, though the pieces he produced were not equal to the two already mentioned; one of the most favourite was 'La Fausse Agnès,' a farcical comedy resembling Murphy's 'Citizen.' From that time he devoted himself to theology, and wrote several essays against infidelity. He died in 1754.

DEVEREUX. [ESSEX, EARL OF.]

D'EWES, SIR SYMONDS, was born at Coxden, in Dorsetshire, December 18, 1602. From the Grammar school of Bury St. Edmunds he proceeded to St. John's College, Cambridge, and having completed the usual course of study there, went to London, entered upon the study of the law, and in due time was called to the bar. But being heir to considerable property, and seeing the threatening state of public affairs, he did not commence practice, but retired to his property at Stow Hall in Suffolk, and to the life of a country gentleman. In 1639 he was high-sheriff of Suffolk, and received the honour of knighthood. In the following year he was elected member of parliament for Sudbury; and he was created a baronet by Charles I. in 1641. D'Ewes was a puritan in religion, and naturally adhered to the same party in politics; but he was opposed to the adoption of extreme measures against the king, and was one of the members expelled from the House by the application of Pride's purge. He died April 18, 1650. Sir Symonds D'Ewes was a man of considerable learning and great industry, and he made an extensive collection of records and historical manuscripts which he placed at the service of the learned, and which were largely used by Selden and other constitutional writers and inquirers of that day. He did not himself publish anything, except two speeches which he delivered in the House of Commons—one an endeavour to establish the superior antiquity of Cambridge over Oxford University (4to, 1642), and another, a disproof of the authenticity of the Greek postscripts of the Epistles of Timothy and Titus (directed of course against the claims of episcopacy); but a work of considerable value compiled by him was published some forty years after his death by his nephew Mr. Paul Bowes: 'The Journals of all the Parliaments during the reign of Queen Elizabeth, both of the House of Lords and Commons,' fol., Lond., 1682. A more remarkable record of the man however was published in 1845: 'The Autobiography and Correspondence of Sir Symonds D'Ewes, Bart., during the reign of James I. and Charles I.; edited by J. O. Halliwell, Esq.,' 4 vols. 8vo. It extends down to 1636 only, and consequently does not reach the period when contemporary notes of one who was at the same time a moderate puritan, an actor in the parliamentary struggles, and an observer of the great events preceding the death of Charles, would have been peculiarly valuable; but it contains, amidst a great deal that is wholly valueless, much interesting information illustrative of his times, and of many of his more eminent contemporaries. D'Ewes himself it shows to have been a thorough pedant, with a certain amount of shrewdness as well as of learning, and a most marvellous stock of conceit.

DE WITT, JOHN, was born at Dort, in the province of Holland, in September 1625. His father was burgomaster of his native town, and member of the states of Holland, in which capacity he was an opponent of the House of Orange, whose power and influence had been looked upon with jealousy ever since the time of Barneveldt by a considerable party in that province. [BARNEVELDT.] John de Witt, who inherited his father's principles, was made in 1652 grand pensioner of Holland, an office which gave him great influence over the deliberations of the States-General or Federal Assembly of the Seven United provinces, in which the vote of the rich and populous province of Holland generally carried with it that of the majority.

The time appeared favourable to the anti-Orange party. William II. of Orange, the last stadtholder, had died in 1650, and his posthumous son, afterwards William III. of England, was an infant. The object of De Witt and his party was to prevent in future the union of the offices of stadtholder, captain-general, and high-admiral in one and the same person, which had rendered the princes of the House of Orange almost equal to sovereigns, and which was certainly inconsistent with the title of a republic, assumed by the united provinces. It must however be observed, that each of these provinces, forming a separate state, was in fact governed by an aristocracy, the respective states or legislature of each consisting of the nobles and the deputies of the principal towns, who were elected by the wealthier burghers; the great majority of the people having no share in the elections. Generally speaking then, the so-called republican party, at the head of which were successively Barneveldt and De Witt, struggled for the continuation or extension of their collective power against the House of Orange, whose influence tended to establish a form nearly monarchical. But that House was popular with the lower classes, and was supported by the majority of the clergy. The nature of the institutions of the United Provinces may be seen in the Act of Union of Utrecht, which was their declaration of independence. During the minority of William III., the office of stadtholder was considered as abolished, and the States-General exercised the supreme authority: De Witt was the soul of their deliberations, and he managed, especially the foreign relations of the country, with great ability. He negotiated the peace with Cromwell in 1654, by a secret article of which it was agreed that no member of the House of Orange should be made stadtholder or high admiral.

After the restoration of Charles II., De Witt, dreading the family connection between him and young William, sought the alliance of France in 1664. A war broke out between England and the United Provinces, which was at first favourable to the English, but De Witt, by his firmness and sagacity, repaired the losses of his countrymen; and while negotiations for peace were pending, he hastened their conclusion by sending an armament under Ruyster, which entered the Thames and burnt some of the English shipping in the Medway. This was followed by the peace of Breda, July 1667. The encroaching ambition of Louis XIV., who aimed at taking possession of the Spanish Netherlands, now excited the alarm of De Witt, who hastened to form a triple alliance with England and Sweden, in order to guarantee the possessions of Spain. In his anxiety to secure his country against the approach of the French, he caused the treaty to be ratified by the States-General at once, instead of first referring it, according to the provisions of the Federal Act, to the acceptance of the various provinces separately. This was a cause of violent obloquy against De Witt.

While thus occupied with the foreign relations he did not forego his plans concerning the internal policy of his country, and the permanent exclusion of the Orange family from power. In 1667 the states of Holland, at his suggestion, passed "a perpetual edict," abolishing for ever the office of stadtholder. De Witt at the same time introduced the greatest order and economy into the finances of the province of Holland. But all De Witt's calculations, both foreign and domestic, were baffled by the intrigues with which Louis XIV. contrived in 1672 not only to detach Charles II. from the Dutch alliance, but to engage him in a counter-alliance with himself against Holland. The French armies now suddenly invaded the United Provinces, Louis XIV. entered Utrecht, and his troops were within a few miles of Amsterdam. There appears to have been great neglect on the part of the officers, civil and military, of the United Provinces, in not having taken measures for resistance, and especially in not having placed their fortresses in a state of defence; and the blame was chiefly thrown upon De Witt. In this emergency, William, the young prince of Orange, was called to the command of the forces both by land and sea; but this did not satisfy the popular clamour. Cornelius De Witt, John's brother, who had filled several important stations, both civil and military, was accused, evidently through mere malignity, of having plotted against the life of William of Orange, was thrown into prison at the Hague, and tortured; but as he could not be convicted of the charge, he was sentenced to banishment. His brother John, whose life had been already attempted by assassins, resigned his office, and went to the Hague in his carriage to receive his brother as he came out of prison. A popular tumult ensued; the furious mob, instigated by the partisans of the house of Orange, forced its way into the prison, and murdered both brothers with circumstances of the greatest atrocity. Such was the end of this distinguished statesman, whose private character and simplicity were as exemplary as his abilities were high. He wrote his 'Memoirs,' which were published in his lifetime, and in which there is much information on the political and financial condition of Holland at the time.

(Cesier, *Histoire des Provinces Unies*; Sir William Temple, *Observations on the United Provinces*; *The Netherland Historian*, 8vo, Amsterdam, 1675, &c.)

D'HILLIERS, LOUIS-BARAGUAY, was born at Paris on the 13th of August 1784, and was a lieutenant when the revolution broke out. In 1793 he was appointed to a brigade in Custine's army, and almost immediately after quarter-master-general. Sent to prison during the Reign of Terror, owing to his attachment to his unfortunate friend Custine, his life was saved by the fall of Robespierre. He took part

in the great Italian campaigns of 1796-97 under Bonaparte, was made a general of division March 10, 1797, and accompanied Bonaparte to Egypt. On the 14th of June 1804, he received the rank of grand officer of the Legion of Honour. During the campaign of 1805, General Baraguay d'Hilliers greatly distinguished himself, especially at the battle of Elchingen. He defeated, with his single division, a strong body of Austrians at Waldmünchen; and at Belsen all the military stores fell into his hands. In 1806 he held a command in Friuli, and two years after was named governor of Venice. He likewise took part in the Peninsular war in 1810 and 1811; but here ended the long series of his successes. During the disastrous campaign in Russia, he fell with nearly all his division into the enemy's hands, was bitterly censured by Napoleon, and this reproof broke his heart. He died a few months after this disgrace, in 1812, at Berlin. (*Nouvelle Biographie Générale*.)

*D'HILLIERS, BARAGUAY, MARSHAL, the son of the republican general noticed above, was born on the 6th of September 1795. He studied for some time at a military college, entered the army as sub-lieutenant in 1812, and served during the arduous Russian campaign. The following year he became one of the aides-de-camp of Marshal Marmont, and was present in several of the fierce battles of 1813 in Germany, being badly wounded in the head at Kulmsee, and having his fore-arm shattered by a cannon-ball at the battle of Leipzig, October 18, 1813. Soon after he went to Spain, and on the 8th of June 1815 was raised to the rank of captain. In 1823 he accompanied the Duke of Angoulême into Spain, and was made major of the 2nd regiment of foot-guards, October 4, 1826. In 1830 he joined the expedition of General Bourmont against Algiers, and after the capture of that city was created colonel. Shortly after the revolution of July (1830) he was raised to the important office of governor of the military school of Saint-Cyr, and in 1832 suppressed a republican plot within the walls of the institution; two of the ringleaders, Trevenenc and Guimard, afterwards became his colleagues in the National Assembly. On the 29th of September 1836 he was made major-general, and lieutenant-general in 1843. The following year he was sent to Algeria, and had the command of Constantina.

After the fall of Louis Philippe in 1848, General Baraguay d'Hilliers received the command of Besançon, and in 1849 was appointed commander-in-chief of the principal corps-d'armées of the Mediterranean. The same year he was despatched to Rome, on a mission to the pope. After his return from Italy he was promoted to the command of the 3rd Military Division, May 4, 1850. In November 1853 he was sent as ambassador to Constantinople; but in consequence of a difference of opinion among the diplomatic agents, M. Baraguay d'Hilliers requested to be recalled, and he was appointed by the emperor to the command of the French military force sent to the Baltic. There his principal achievement was the capture, in concert with the English force, of Bomarsund, August 1854. For this service he was created a marshal of France. He is now one of the vice-presidents of the senate, and has received the grand cross of the Legion of Honour. The marshal is in his sixty-first year, and has been forty-four years in the service, under six different governments.

(*Nouvelle Biographie Générale*; *Diction. de Conversation*.)

DIADUMENIANUS, MARCUS OPELIUS ANTONINUS, was the son of Macrinus, who was proclaimed emperor by the soldiers after the murder of Caracalla, A.D. 217. After his father's elevation, Diadumenianus, who was then at Antioch, was proclaimed Caesar by the soldiers, and confirmed by the senate at Rome. He was not quite ten years of age, but is said to have been very handsome and graceful in his person. The reign of Macrinus lasted only fourteen months; a military insurrection, excited by Mæsa, the aunt of Caracalla, who wished to put on the throne her grandson Bassianus, also called Heliogabalus, led to the overthrow of Macrinus, who was defeated near Antioch, and afterwards made prisoner, but killed himself. Diadumenianus, who had escaped from Antioch, was also seized and put to death, A.D. 218. He has been numbered among the emperors, because his father in the latter days of his reign is said to have proclaimed him Augustus and his colleague in the empire. Diadumenianus is celebrated for his marvellous beauty; Lampridius is especially eloquent on this theme. (Lampridius in *Historia Augusta*; Dion, *Epitome*, B. 73.)

Coin of Diadumenianus.

British Museum. Actual size. Copyer. Weight 845 grains.

DIA'GORAS OF MELOS, known also by the name of the Atheist, flourished, according to Suidas, the 75th Olympiad, B.C. 468-65. Mr. Clinton has adopted this date; but Scaliger (in Euseb. 'Chron.' p. 101) placed him considerably later, fixing his flight from Athens in the year B.C. 415; and he has been generally followed. The date which Mr. Clinton has taken is the more probable. Diagoras is chiefly known for his asserted open denial of the existence of gods; but it may be doubted whether this was more than a popular prejudice: what is known of his writings gives no support to the charge of atheism, but the common opinion of the ancients fixes the charge upon him. Diagoras is said to have broached atheism on seeing a man who had stolen one of his writings and published it as his own go unpunished for the crime. (Sext. Empir. 'adv. Math.' p. 318.) On account of this atheism it is generally said that the Athenians put a price upon his head, offering a talent to any who should kill him, and two to any one who should bring him alive; though Suidas, Athenagoras, and Tatian attribute the indignation of the Athenians, and the subsequent flight of Diagoras, to his having divulged the nature of some of their mysteries. It is not impossible however that this was one of the overt acts by which his character for atheism was established; in which case the two accounts, which seem to differ, would really coincide. He is said to have been bought as a slave by Democritus, and also to have met his death by shipwreck. (Athen. xiii. p. 611, B.) Aristophanes in his play of the 'Clouds,' one object of which was to raise a religious outcry against Socrates, has maliciously fastened on him the odious name of the Melian. ('Clouds,' 830.)

Ælian ('Var. Hist.' ii. 23) says that Diagoras assisted Nicodorus in drawing up the laws of the Mantineans. Diagoras was also a lyric poet, though some, apparently without sufficient grounds, have attempted to separate the lyric poet from the atheist.

(Bayle, *Dictionary*; Fabricius, *Bibliotheca Græca*, ed. Harles, vol. ii. pp. 119 and 655; Meier in Gruber's *Allgem. Enc.* xxiv. pp. 439-48.)

DIBDIN, CHARLES, in whose person the British bard may be said to have been revived, was born in 1746 at Southampton, near which place his grandfather, a considerable merchant, founded a village that bears his name. When Charles Dibdin was born, his mother had reached her fiftieth year, and he was her eighteenth child. He had a brother, Thomas, twenty-nine years older than himself, on whose death he wrote the beautiful ballad 'Poor Tom Bowling.' This gentleman was captain of an East-Indiaman, and father of Thomas Frognall Dibdin, D.D.

The subject of the present notice was educated at Winchester, and originally designed for the clerical profession. But his love for music predominated, and after receiving some instruction from the celebrated Kent, organist of Winchester Cathedral, he was sent to London, and commenced his career, as poet and musician, at the early age of sixteen, when he produced an opera at Covent Garden Theatre, written and composed by himself, called 'The Shepherd's Artifice.' A few years after he appeared as an actor, and was, in 1768, the original Mungo in his own 'Padlock.' In 1778 he became musical manager of Covent Garden theatre, at a salary of ten pounds a week. About 1782 he built the Circus theatre (afterwards opened under the name of the Surrey), which continued under his management some three or four years. In 1788 he published his 'Musical Tour,' in one vol. 4to; and in 1789 presented to the public, at Hutchinson's auction rooms, King Street, Covent Garden, the first of those entertainments whereby he so eminently distinguished himself,—and of which he was sole author, composer, and performer,—under the title of 'The Whim of the Moment.' In this, among sixteen other songs, was the ballad 'Poor Jack,' an effusion of genius that immediately established his reputation, both as a lyric poet and melodist. The year 1791 saw Dibdin in his Sans Souci, an exhibition-room in the Strand, situated up by him; and in 1796 he erected a small theatre in Leicester Fields, giving it the above-named title. This he sold in 1805, and retired from public life; but not having been provident while the means of making some provision for the future were in his power, his retreat was not accompanied by independence. This having been properly represented, government granted him a pension of 200l. per annum, an act evincing both a sense of justice and a right feeling. Of this he was for a time deprived by Lord Grenville, but a more liberal ministry restored it. Towards the close of the year 1818 he was attacked by paralysis, and died in the July following. Mr. Dibdin published one or two novels, and some smaller works, but his fame is built on his songs, of which—so prolific was his muse, and so great his facility in composition—he produced the amazing number of nine hundred! Out of this large number we may readily acknowledge a considerable portion to be comparatively worthless. His sea songs however have become permanent favourites, and it is said that, during the war, their influence was most strongly felt in supplying the navy with volunteers. And it is not too much to say that no English song writer ever produced so many ballads so thoroughly adapted to the popular taste, and which, as has been truly said, are so generally "on the side of virtue;" humanity, constancy, love of country, and courage being almost always the subjects of his song and the themes of his praise.

DIBDIN, THOMAS, one of the sons of Charles Dibdin, was born in 1771. After having spent some time at a school in the north of England, he was apprenticed at the age of sixteen to an upholsterer in London, whom he served for four years. He then joined a company

of strolling players in Essex, and for several years wandered through the country in that profession. In 1795 he returned to London, where he wrote a number of very successful pieces for the minor theatres; and in 1797 he was engaged as an actor at Covent Garden Theatre, with which, as actor or author, he continued to be connected for fourteen years. The latter part of his life was spent in indigence. At the time of his death he was engaged in compiling an edition of his father's sea-songs, for which he received an allowance from the Lords of the Admiralty. He died at Pentonville on the 16th of September 1841, leaving children by each of two marriages. Thomas Dibdin's comedies, operas, and farces are numerous enough to fill a long paragraph with their bare names. Many of them were composed for temporary purposes; and many others had little or no success. But there are one or two, as the opera of the 'Cabinet,' which, either through merits of their own or by their adaptation to particular actors and singers, still maintain a place on the stage.

DIBDIN, REV. THOMAS FROGNALL, the most conspicuous English writer on Bibliography in the earlier half of the nineteenth century, was born at Calcutta in 1776. His father, Captain Thomas Dibdin, the commander of a sloop of war in the Indian Ocean, was the elder brother of Charles Dibdin, the celebrated naval song-writer. [DIBDIN, CHARLES.] Both he and his wife, whom he had first met in the East Indies, died on their passage home in the year 1780, and Frognall Dibdin first landed on the English shore an orphan of four years old. His mother's brother, Mr. Compton, took charge of him from that age to man's estate; and of other relations he saw so little, that, he tells us in his 'Reminiscences,' he conversed with his famous uncle Charles but once in his life, though Charles lived till 1814, when Frognall was eight-and-thirty. He was sent to St. John's College, Oxford, but quitted the university without taking a degree, and studied the law under Mr. Basil Montague, whose office he left to practise in the unusual character of a provincial counsel at Worcester.

Finding no prospect of success, he soon abandoned the law for the church; and a passage in his 'Reminiscences,' in which he describes his studies, furnishes the key-note of much of his subsequent career. "In Greek Testaments my little library was rather richly stored. I revelled in choice copies of the first Erasmus, and of the first Stephen, and defied any neighbouring clergyman to match me in Elzevirs and in Tanson." In London, to which he speedily returned, and where he became a preacher at some fashionable chapels at the west-end, he was less known in the clerical than in the literary, or rather the book-selling world. At that time, the 'bibliomania,' as it was called, or fancy for purchasing rare and curious books at extravagant prices, was advancing to a height which it had never before attained in England or elsewhere. It reached its culminating point at the celebrated sale of the library of the Duke of Roxburghe, in June 1812, where a copy of an early edition of Boccaccio, printed by Valdarfer, at Florence, in 1471, was sold to the Marquis of Blandford, afterwards Duke of Marlborough, for the sum of 2260*l.*; and it was afterwards discovered that an imperfect copy of the same book was in the Sunderland library at Blenheim, at the very time of the purchase, but had three times over escaped being mentioned in the catalogue.

Dr. Dibdin proposed, at a dinner party at Baron Bolland's, even before the Valdarfer was sold, the establishment of a club, to dine together in honour of Bibliography. The club was established under the name of the Roxburghe Club: and he became the first vice-president. This club afterwards adopted the rule that each of its members should every year reprint a book, to be presented to every member; and this practice seems to have led to the establishment of the numerous printing and publishing clubs now in existence, more liberal in their regulations than the original. The rise and progress of the bibliomania was stimulated and recorded by different publications of Dr. Dibdin: an 'Introduction to the Greek and Roman Classics,' in 1802; a dialogue, entitled 'Bibliomania,' in 1809, which was reprinted, with great enlargements in 2 vols., in 1811; and the 'Bibliographical Decameron,' in three large vols., in 1817. A new edition of Ames's 'Typographical Antiquities' was also commenced by him, and carried as far as four volumes, between 1810 and 1819; and a minute account of the rare books in Earl Spencer's library, under the title of the 'Bibliotheca Spenceriana,' which occupied four volumes, and was extended by the 'Ædes Althorpiana,' a description of Earl Spencer's seat at Althorp; and by an account of the Cassano library purchased by him; in the whole seven volumes. In 1818, Dr. Dibdin made a tour abroad, to purchase books for the same patron, and the result was, a 'Bibliographical, Antiquarian, and Picturesque Tour in France and Germany,' 3 vols. 8vo, 1821. These works, particularly the 'Bibliographical Decameron' and the 'Tour,' present beautiful specimens of typography and engraving, produced at an expense which the author was never weary of proclaiming. In 'The Library Companion; or, Young man's Guide and Old Man's Comfort in the Choice of a Library' (1824), he apparently aspired at producing something of more general and permanent use; but the result was disastrous. The flippant and frivolous character of his remarks, and the inaccurate and superficial character of his information, were commented upon in so severe a tone by some of the leading reviews, in particular the 'Quarterly' and the 'Westminster,' that his reputation never recovered the shock. In the preceding year he had obtained, by the patronage of Earl Spencer, his first preferment in the church—the living of Exning, near New-

market; he was afterwards appointed to the rectory of St. Mary, Bryanstone Square; and his publications for some years were chiefly of a theological character. He returned to the field of bibliography in his 'Reminiscences of a Literary Life' (2 vols. 1836), and in his 'Bibliographical, Antiquarian, and Picturesque Tour in the Northern Counties of England and in Scotland' (3 vols. 1838). He also made, not long before his death, a tour in Belgium, of which he also intended to publish an account. He died on the 18th of November 1847, after a long illness, of paralysis of the brain. His latter years had been much clouded with pecuniary difficulties.

Many of the publications of Dr. Dibdin have already been enumerated, but it will be necessary to recur to some of them to afford a fuller notion of their character. The most important is the 'Typographical Antiquities of Great Britain.' The meritorious work of Ames on that subject, professing to give an account of all the works printed in England from the introduction of the art to the year 1600, had been expanded from one volume to three by Herbert, who made such extensive additions that the work might justly be regarded as no longer Ames's, but his own. There was still room for extensive improvement on Herbert—a very simple alteration even in the arrangement would have much increased its value to nearly all who consulted it. The titles of the books are disposed under the names of the printers: had they been disposed instead, according to Panzer's plan, in his 'Annals of German Literature,' in the plain order of date, a host of particulars would have presented themselves in combination which are now scattered and inaccessible. It would have been far from uninteresting to observe what books issued from the press in England during the year in which Henry broke up the monasteries, in which Mary lighted the fires of Smithfield, or in which Shakspeare first came to London. Dibdin has preserved the old arrangement, and has so much augmented the matter that the four volumes of his edition, which was left imperfect, carry the record no further than the middle of the second volume of Herbert's three. Some of the matter which he has added is of interest, in particular his more minute account of the productions of Caxton, but much is mere idle surplussage—biographies of book-collectors of the 18th century, illustrated with their portraits, which have nothing whatever to do with the history of printing in the 15th and 16th centuries. Much too of the additional matter for which he has obtained credit is taken from the manuscript notes which Herbert had prepared for a second edition, and inserted in a copy of his work which is now in the British Museum. It is to be hoped that the whole subject will be resumed ere long by some competent scholar, with the numerous additional materials now at his command in our public libraries, when, with some industry and intelligence, a work may be produced which will interest not only the bibliographer but all who have a tincture of feeling for literary matters. The 'Bibliotheca Spenceriana,' from its containing particulars of many books not accessible to the public in general, is often used as a work of reference; but those who have consulted it the oftener regard it with the most distrust. Such was Dr. Dibdin's habit of inaccuracy, that in two accounts of the origin of the Roxburghe Club, to him a matter of great importance and interest, given in two of his works, the dates are utterly irreconcilable. In the 'Decameron' (vol. iii., p. 69), he distinctly states that the dinner at which he proposed it was on the 4th of June; in the 'Reminiscences' (p. 367), he states no less distinctly that it was "on the evening before the sale of the 'Boccaccio' of 1471, which took place on the 17th of June 1812." It may easily be conceived that his accounts of the dates of rare books are not to be depended on till after they have been verified. It may be remarked also that his way of describing a book has too little of the scholar and the man of letters, and too much of the bookseller and the bookbinder. The width of the margin, and the kind of leather in which a book is coated, attract as much of his attention as the particulars which all copies of the book have in common. The 'Tours' are a singular compound of anecdotes of rare interest mixed up with the most idle and irrelevant matter. The 'Decameron' is by far the best of Dr. Dibdin's works, as comprising the least of detail and the most of anecdote; and it is written in many portions with a degree of care and spirit often wanting in his other works. The 'Reminiscences' afford singular proof that, although the author of an 'Introduction to the Classics,' his acquaintance with some of them was more than usually deficient. On the whole, though his bibliographical works abound with much that the reader wishes away, they are indispensable in any large library of English literature. His other productions, which are numerous, will be found mentioned in his own 'Reminiscences.'

DICEARCHUS, the son of Phidias, was born in the city of Messana in Sicily. He was a scholar of Aristotle, and is called a peripatetic philosopher by Cicero ('De Officiis,' ii. 5); but though he wrote some works on philosophical subjects, he seems to have devoted his attention principally to geography and statistics. His chief philosophical work was one 'On the Soul,' in two dialogues, each divided into three books: one dialogue being supposed to be held at Corinth, the other at Mitylene. In these he argued against the Platonic doctrine of the soul, and indeed altogether denied its existence. In the second and third books of the Corinthian dialogue, Cicero tells us ('Tuscul. Disput.,' l. 10), he introduced an old Pthiot named Pherecrates, maintaining that the soul was absolutely nothing; that the word was a mere empty sound; that there was no soul either in man

in the great Italian campaigns of 1796-97 under Bonaparte, was made a general of division March 10, 1797, and accompanied Bonaparte to Egypt. On the 14th of June 1804, he received the rank of grand officer of the Legion of Honour. During the campaign of 1805, General Baraguay d'Hilliers greatly distinguished himself, especially at the battle of Elchingen. He defeated, with his single division, a strong body of Austrians at Waldmünchen; and at Belsen all the military stores fell into his hands. In 1806 he held a command in Friuli, and two years after was named governor of Venice. He likewise took part in the Peninsular war in 1810 and 1811; but here ended the long series of his successes. During the disastrous campaign in Russia, he fell with nearly all his division into the enemy's hands, was bitterly censured by Napoleon, and this reproof broke his heart. He died a few months after this disgrace, in 1812, at Berlin. (*Nouvelle Biographie Générale*.)

*D'HILLIERS, BARAGUAY, MARSHAL, the son of the republican general noticed above, was born on the 6th of September 1795. He studied for some time at a military college, entered the army as sub-lieutenant in 1812, and served during the arduous Russian campaign. The following year he became one of the aides-de-camp of Marshal Marmont, and was present in several of the fierce battles of 1813 in Germany, being badly wounded in the head at Kulmsee, and having his fore-arm shattered by a cannon-ball at the battle of Leipsig, October 18, 1813. Soon after he went to Spain, and on the 8th of June 1815 was raised to the rank of captain. In 1823 he accompanied the Duke of Angoulême into Spain, and was made major of the 2nd regiment of foot-guards, October 4, 1826. In 1830 he joined the expedition of General Bourmont against Algiers, and after the capture of that city was created colonel. Shortly after the revolution of July (1830) he was raised to the important office of governor of the military school of Saint-Cyr, and in 1832 suppressed a republican plot within the walls of the institution; two of the ringleaders, Trevenenc and Guimard, afterwards became his colleagues in the National Assembly. On the 29th of September 1836 he was made major-general, and lieutenant-general in 1843. The following year he was sent to Algeria, and had the command of Constantina.

After the fall of Louis Philippe in 1848, General Baraguay d'Hilliers received the command of Besançon, and in 1849 was appointed commander-in-chief of the principal corps-d'armée of the Mediterranean. The same year he was despatched to Rome, on a mission to the pope. After his return from Italy he was promoted to the command of the 3rd Military Division, May 4, 1850. In November 1853 he was sent as ambassador to Constantinople; but in consequence of a difference of opinion among the diplomatic agents, M. Baraguay d'Hilliers requested to be recalled, and he was appointed by the emperor to the command of the French military force sent to the Baltic. There his principal achievement was the capture, in concert with the English force, of Bomarsund, August 1854. For this service he was created a marshal of France. He is now one of the vice-presidents of the senate, and has received the grand cross of the Legion of Honour. The marshal is in his sixty-first year, and has been forty-four years in the service, under six different governments.

(*Nouvelle Biographie Générale*; *Diction. de Conversation*.)

DIADUMENIANUS, MARCUS OPELIUS ANTONINUS, was the son of Macrinus, who was proclaimed emperor by the soldiers after the murder of Caracalla, A.D. 217. After his father's elevation, Diadumenianus, who was then at Antioch, was proclaimed Caesar by the soldiers, and confirmed by the senate at Rome. He was not quite ten years of age, but is said to have been very handsome and graceful in his person. The reign of Macrinus lasted only fourteen months; a military insurrection, excited by Meia, the aunt of Caracalla, who wished to put on the throne her grandson Bassianus, also called Heliogabalus, led to the overthrow of Macrinus, who was defeated near Antioch, and afterwards made prisoner, but killed himself. Diadumenianus, who had escaped from Antioch, was also seized and put to death, A.D. 218. He has been numbered among the emperors, because his father in the latter days of his reign is said to have proclaimed him Augustus and his colleague in the empire. Diadumenianus is celebrated for his marvellous beauty; Lampridius is especially eloquent on this theme. (Lampridius in *Historia Augusta*; Dion, *Epitome*, B. 73.)

Coin of Diadumenianus.

British Museum. Actual size. Copies. Weight 345 grains.

DIA'GORAS OF MELOS, known also by the name of the Atheist, flourished, according to Suidas, the 78th Olympiad, B.C. 468-65. Mr. Clinton has adopted this date; but Scaliger (in Euseb. 'Chron.' p. 101) placed him considerably later, fixing his flight from Athens in the year B.C. 415; and he has been generally followed. The date which Mr. Clinton has taken is the more probable. Diagoras is chiefly known for his asserted open denial of the existence of gods; but it may be doubted whether this was more than a popular prejudice: what is known of his writings gives no support to the charge of atheism, but the common opinion of the ancients fixes the charge upon him. Diagoras is said to have broached atheism on seeing a man who had stolen one of his writings and published it as his own go unpunished for the crime. (Sext. Empir. 'adv. Math.' p. 318.) On account of this atheism it is generally said that the Athenians put a price upon his head, offering a talent to any who should kill him, and two to any one who should bring him alive; though Suidas, Athenagoras, and Tatian attribute the indignation of the Athenians, and the subsequent flight of Diagoras, to his having divulged the nature of some of their mysteries. It is not impossible however that this was one of the overt acts by which his character for atheism was established; in which case the two accounts, which seem to differ, would really coincide. He is said to have been bought as a slave by Democritus, and also to have met his death by shipwreck. (Athen. xiii. p. 611, B.) Aristophanes in his play of the 'Clouds,' one object of which was to raise a religious outcry against Socrates, has maliciously fastened on him the odious name of the Melian. ('Clouds,' 830.)

Ælian ('Var. Hist.' ii. 23) says that Diagoras assisted Nicodorus in drawing up the laws of the Mantinea. Diagoras was also a lyric poet, though some, apparently without sufficient grounds, have attempted to separate the lyric poet from the atheist.

(Bayle, *Dictionnaire*; Fabricius, *Bibliotheca Græca*, ed. Harles, vol. ii. pp. 119 and 655; Meier in Gruber's *Allgem. Enc.* xxiv. pp. 430-48.)

DIBDIN, CHARLES, in whose person the British bard may be said to have been revived, was born in 1746 at Southampton, near which place his grandfather, a considerable merchant, founded a village that bears his name. When Charles Dibdin was born, his mother had reached her fiftieth year, and he was her eighteenth child. He had a brother, Thomas, twenty-nine years older than himself, on whose death he wrote the beautiful ballad 'Poor Tom Bowling.' This gentleman was captain of an East-Indiaman, and father of Thomas Frognall Dibdin, D.D.

The subject of the present notice was educated at Winchester, and originally designed for the clerical profession. But his love for music predominated, and after receiving some instruction from the celebrated Kent, organist of Winchester Cathedral, he was sent to London, and commenced his career, as poet and musician, at the early age of sixteen, when he produced an opera at Covent Garden Theatre, written and composed by himself, called 'The Shepherd's Artifice.' A few years after he appeared as an actor, and was, in 1768, the original Mungo in his own 'Padlock.' In 1778 he became musical manager of Covent Garden theatre, at a salary of ten pounds a week. About 1782 he built the Circus theatre (afterwards opened under the name of the Surrey), which continued under his management some three or four years. In 1788 he published his 'Musical Tour,' in one vol. 4to; and in 1789 presented to the public, at Hutchinson's auction rooms, King Street, Covent Garden, the first of those entertainments whereby he so eminently distinguished himself,—and of which he was sole author, composer, and performer,—under the title of 'The Whim of the Moment.' In this, among sixteen other songs, was the ballad 'Poor Jack,' an effusion of genius that immediately established his reputation, both as a lyric poet and melodist. The year 1791 saw Dibdin in his Sans Souci, an exhibition-room in the Strand, sit up by him; and in 1796 he erected a small theatre in Leicester Fields, giving it the above-named title. This he sold in 1805, and retired from public life; but not having been provident while the means of making some provision for the future were in his power, his retreat was not accompanied by independence. This having been properly represented, government granted him a pension of 200l. per annum, an act evincing both a sense of justice and a right feeling. Of this he was for a time deprived by Lord Grenville, but a more liberal ministry restored it. Towards the close of the year 1813 he was attacked by paralysis, and died in the July following. Mr. Dibdin published one or two novels, and some smaller works, but his fame is built on his songs, of which—so prolific was his muse, and so great his facility in composition—he produced the amazing number of nine hundred! Out of this large number we may readily acknowledge a considerable portion to be comparatively worthless. His sea-songs however have become permanent favourites, and it is said that, during the war, their influence was most strongly felt in supplying the navy with volunteers. And it is not too much to say that no English song writer ever produced so many ballads so thoroughly adapted to the popular taste, and which, as has been truly said, are so generally "on the side of virtue;" humanity, constancy, love of country, and courage being almost always the subjects of his song and the themes of his praise.

DIBDIN, THOMAS, one of the sons of Charles Dibdin, was born in 1771. After having spent some time at a school in the north of England, he was apprenticed at the age of sixteen to an upholsterer in London, whom he served for four years. He then joined a company

of strolling players in Essex, and for several years wandered through the country in that profession. In 1795 he returned to London, where he wrote a number of very successful pieces for the minor theatres; and in 1797 he was engaged as an actor at Covent Garden Theatre, with which, as actor or author, he continued to be connected for fourteen years. The latter part of his life was spent in indigence. At the time of his death he was engaged in compiling an edition of his father's sea-songs, for which he received an allowance from the Lords of the Admiralty. He died at Pentonville on the 18th of September 1841, leaving children by each of two marriages. Thomas Dibdin's comedies, operas, and farces are numerous enough to fill a long paragraph with their bare names. Many of them were composed for temporary purposes; and many others had little or no success. But there are one or two, as the opera of the 'Cabinet,' which, either through merits of their own or by their adaptation to particular actors and singers, still maintain a place on the stage.

DIBDIN, REV. THOMAS FROGNALL, the most conspicuous English writer on Bibliography in the earlier half of the nineteenth century, was born at Calcutta in 1776. His father, Captain Thomas Dibdin, the commander of a sloop of war in the Indian Ocean, was the elder brother of Charles Dibdin, the celebrated naval song-writer. [DIBDIN, CHARLES.] Both he and his wife, whom he had first met in the East Indies, died on their passage home in the year 1780, and Frognall Dibdin first landed on the English shore an orphan of four years old. His mother's brother, Mr. Compton, took charge of him from that age to man's estate; and of other relations he saw so little, that, he tells us in his 'Reminiscences,' he conversed with his famous uncle Charles but once in his life, though Charles lived till 1814, when Frognall was eight-and-thirty. He was sent to St. John's College, Oxford, but quitted the university without taking a degree, and studied the law under Mr. Basil Montague, whose office he left to practise in the unusual character of a provincial counsel at Worcester.

Finding no prospect of success, he soon abandoned the law for the church; and a passage in his 'Reminiscences,' in which he describes his studies, furnishes the key-note of much of his subsequent career. "In Greek Testaments my little library was rather richly stored. I revelled in choice copies of the first Erasmus, and of the first Stephen, and defied any neighbouring clergyman to match me in Elzevirs and in Toulson." In London, to which he speedily returned, and where he became a preacher at some fashionable chapels at the west-end, he was less known in the clerical than in the literary, or rather the book-selling world. At that time, the 'bibliomania,' as it was called, or fancy for purchasing rare and curious books at extravagant prices, was advancing to a height which it had never before attained in England or elsewhere. It reached its culminating point at the celebrated sale of the library of the Duke of Roxburghe, in June 1812, where a copy of an early edition of Boccaccio, printed by Valdarfer, at Florence, in 1471, was sold to the Marquis of Blandford, afterwards Duke of Marlborough, for the sum of 2260*l.*; and it was afterwards discovered that an imperfect copy of the same book was in the Sunderland library at Blenheim, at the very time of the purchase, but had three times over escaped being mentioned in the catalogue.

Dr. Dibdin proposed, at a dinner party at Baron Bolland's, even before the Valdarfer was sold, the establishment of a club, to dine together in honour of Bibliography. The club was established under the name of the Roxburghe Club: and he became the first vice-president. This club afterwards adopted the rule that each of its members should every year reprint a book, to be presented to every member; and this practice seems to have led to the establishment of the numerous printing and publishing clubs now in existence, more liberal in their regulations than the original. The rise and progress of the bibliomania was stimulated and recorded by different publications of Dr. Dibdin: an 'Introduction to the Greek and Roman Classics,' in 1802; a dialogue, entitled 'Bibliomania,' in 1809, which was reprinted, with great enlargements in 2 vols., in 1811; and the 'Bibliographical Decameron,' in three large vols., in 1817. A new edition of Ames's 'Typographical Antiquities' was also commenced by him, and carried as far as four volumes, between 1810 and 1819; and a minute account of the rare books in Earl Spencer's library, under the title of the 'Bibliotheca Spenceriana,' which occupied four volumes, and was extended by the 'Ædes Althorpiæ,' a description of Earl Spencer's seat at Althorp; and by an account of the Cassano library purchased by him; in the whole seven volumes. In 1818, Dr. Dibdin made a tour abroad, to purchase books for the same patron, and the result was, a 'Bibliographical, Antiquarian, and Picturesque Tour in France and Germany,' 3 vols. 8vo, 1821. These works, particularly the 'Bibliographical Decameron' and the 'Tour,' present beautiful specimens of typography and engraving, produced at an expense which the author was never weary of proclaiming. In 'The Library Companion; or, Young man's Guide and Old Man's Comfort in the Choice of a Library' (1824), he apparently aspired at producing something of more general and permanent use; but the result was disastrous. The flippant and frivolous character of his remarks, and the inaccurate and superficial character of his information, were commented upon in so severe a tone by some of the leading reviews, in particular the 'Quarterly' and the 'Westminster,' that his reputation never recovered the shock. In the preceding year he had obtained, by the patronage of Earl Spencer, his first preferment in the church—the living of Exning, near New-

market; he was afterwards appointed to the rectory of St. Mary, Bryanstone Square; and his publications for some years were chiefly of a theological character. He returned to the field of bibliography in his 'Reminiscences of a Literary Life' (2 vols. 1836), and in his 'Bibliographical, Antiquarian, and Picturesque Tour in the Northern Counties of England and in Scotland' (3 vols. 1838). He also made, not long before his death, a tour in Belgium, of which he also intended to publish an account. He died on the 18th of November 1847, after a long illness, of paralysis of the brain. His latter years had been much clouded with pecuniary difficulties.

Many of the publications of Dr. Dibdin have already been enumerated, but it will be necessary to recur to some of them to afford a fuller notion of their character. The most important is the 'Typographical Antiquities of Great Britain.' The meritorious work of Ames on that subject, professing to give an account of all the works printed in England from the introduction of the art to the year 1800, had been expanded from one volume to three by Herbert, who made such extensive additions that the work might justly be regarded as no longer Ames's, but his own. There was still room for extensive improvement on Herbert—a very simple alteration even in the arrangement would have much increased its value to nearly all who consulted it. The titles of the books are disposed under the names of the printers: had they been disposed instead, according to Panzer's plan, in his 'Annals of German Literature,' in the plain order of date, a host of particulars would have presented themselves in combination which are now scattered and inaccessible. It would have been far from uninteresting to observe what books issued from the press in England during the year in which Henry broke up the monasteries, in which Mary lighted the fires of Smithfield, or in which Shakspeare first came to London. Dibdin has preserved the old arrangement, and has so much augmented the matter that the four volumes of his edition, which was left imperfect, carry the record no further than the middle of the second volume of Herbert's three. Some of the matter which he has added is of interest, in particular his more minute account of the productions of Caxton, but much is mere idle surplusage—biographies of book-collectors of the 18th century, illustrated with their portraits, which have nothing whatever to do with the history of printing in the 15th and 16th centuries. Much too of the additional matter for which he has obtained credit is taken from the manuscript notes which Herbert had prepared for a second edition, and inserted in a copy of his work which is now in the British Museum. It is to be hoped that the whole subject will be resumed ere long by some competent scholar, with the numerous additional materials now at his command in our public libraries, when, with some industry and intelligence, a work may be produced which will interest not only the bibliographer but all who have a tincture of feeling for literary matters. The 'Bibliotheca Spenceriana,' from its containing particulars of many books not accessible to the public in general, is often used as a work of reference; but those who have consulted it the oftener regard it with the most distrust. Such was Dr. Dibdin's habit of inaccuracy, that in two accounts of the origin of the Roxburghe Club, to him a matter of great importance and interest, given in two of his works, the dates are utterly irreconcilable. In the 'Decameron' (vol. iii., p. 69), he distinctly states that the dinner at which he proposed it was on the 4th of June; in the 'Reminiscences' (p. 367), he states no less distinctly that it was "on the evening before the sale of the 'Boccaccio' of 1471, which took place on the 17th of June 1812." It may easily be conceived that his accounts of the dates of rare books are not to be depended on till after they have been verified. It may be remarked also that his way of describing a book has too little of the scholar and the man of letters, and too much of the bookseller and the bookbinder. The width of the margin, and the kind of leather in which a book is coated, attract as much of his attention as the particulars which all copies of the book have in common. The 'Tours' are a singular compound of anecdotes of rare interest mixed up with the most idle and irrelevant matter. The 'Decameron' is by far the best of Dr. Dibdin's works, as comprising the least of detail and the most of anecdote; and it is written in many portions with a degree of care and spirit often wanting in his other works. The 'Reminiscences' afford singular proof that, although the author of an 'Introduction to the Classics,' his acquaintance with some of them was more than usually deficient. On the whole, though his bibliographical works abound with much that the reader wishes away, they are indispensable in any large library of English literature. His other productions, which are numerous, will be found mentioned in his own 'Reminiscences.'

DICEARCHUS, the son of Phidias, was born in the city of Messana in Sicily. He was a scholar of Aristotle, and is called a peripatetic philosopher by Cicero ('De Officiis,' ii. 5); but though he wrote some works on philosophical subjects, he seems to have devoted his attention principally to geography and statistics. His chief philosophical work was one 'On the Soul,' in two dialogues, each divided into three books: one dialogue being supposed to be held at Corinth, the other at Mitylene. In these he argued against the Platonic doctrine of the soul, and indeed altogether denied its existence. In the second and third books of the Corinthian dialogue, Cicero tells us ('Tuscul. Disput.,' l. 10), he introduced an old Pthiot named Pherecrates, maintaining that the soul was absolutely nothing; that the word was a mere empty sound; that there was no soul either in man

or beast; that the principle by means of which we act and perceive is equally diffused throughout all living bodies, and cannot exist separated from them; and that there is no existence except matter, which is one and simple, the parts of which are naturally so arranged that it has life and perception. The greatest performance of Dicaearchus was a treatise on the geography, politics, and manners of Greece, which he called the 'Life of Greece' ('Ελλάδος βίος'). Of this a fragment has come down to us, which is printed in Hudson's 'Geographici Minores,' and also edited by Marx in Creuzer's 'Meletemata e Discipuli. Antiquitatis,' p. iii. p. 174. It has been conjectured, with great appearance of truth, that the citations from Dicaearchus, in which his treatises 'On Musical Contests,' 'On the Dionysian Contests,' &c., are referred to, are drawn from this comprehensive work, and that the grammarians have named them by the title of the subdivision to which these subjects belonged, instead of the leading title of the book. (See Nake in the 'Rhein. Mus.' for 1833, p. 47.) Dicaearchus's maps were extant in the time of Cicero ('Ep. ad Att.' vi. 2); but his geography was not much to be depended upon. (Strabo, p. 104.) Cicero was very fond of the writings of Dicaearchus, and speaks of him in terms of the warmest admiration. ('Ep. ad Att.' ii. 2.) In the extant fragment Dicaearchus quotes Posidippus, and must therefore have been alive in B.C. 280. We must distinguish him from a Lacedæmonian grammarian of the same name, who was a pupil of Aristarchus. (See Suidas.)

*DICK, THOMAS, LL.D., was born in 1772. He was educated for the Christian ministry in connection with the Secession Church of Scotland, and we believe held a pastoral charge in connection with that body at Stirling in the early part of his career, but it is as a popular writer on physical science that he is best known to the world. The works by which he first became generally known were the 'Christian Philosopher,' and the 'Philosophy of Religion.' These were followed by works on the 'Improvement of Society by the Diffusion of Knowledge,' the 'Mental Illumination of Mankind,' 'The Philosophy of a Future State,' a 'Treatise on the Solar System,' 'Celestial Scenery,' 'The Sideral Heavens,' 'The Practical Astronomer,' and an essay on 'Christian Beneficence, contrasted with Covetousness,' written in competition for the prize which was conferred on Dr. Harris for his work, entitled 'Mammon: or Covetousness the sin of the Christian Church.' Dr. Dick is a man of singularly unobtrusive disposition, and has been content to labour perseveringly for the public instruction, although his immediate reward is but small. His principal works have been reprinted at low prices, and have had extensive circulation, yet the author has derived little pecuniary benefit from them. A public subscription on his behalf as an acknowledgment of the benefits he has conferred upon society was projected a few years since by some of his admirers, but realised a very small amount, the appeal having been more successful in America than in the author's native country. Dr. Dick's works have been reprinted and very extensively sold in the United States. Dr. Dick resides in the small village of Broughty-Ferry, on the left bank of the river Tay, in Forfarshire. Besides instructing the public by his pen, Dr. Dick has been in the habit of accepting occasional appointments to preach in neighbouring churches, and also to deliver popular lectures on scientific subjects. A few years ago a small pension was granted to him by the government in acknowledgment of his services in the advancement of popular science.

*DICKENS, CHARLES, was born in 1812 at Portsmouth, where his father, Mr. John Dickens, who held a situation in the Navy Pay department, was at that time stationed. The duties of his situation led Mr. John Dickens to reside at various naval ports; and a portion of his distinguished son's childhood was thus spent at Chatham—and perhaps early recollections as well as literary associations may have had their influence in leading to his recent purchase of a property at Gadahill in that neighbourhood (the veritable 'Gadahill' of Falstaff's adventures in 'Henry IV.'), as his permanent place of residence (1856). Retiring on a pension shortly after the conclusion of the war in 1815, the father of the novelist became connected as a reporter with the London press. Intending his son for the profession of an attorney, he placed him in an attorney's office for that purpose; and here Mr. Dickens acquired experience in life which he has since turned to account. An early passion for literature however—a passion which he was in the habit of gratifying by abundant reading, more especially in the works of the English novelists and dramatists—rendered him unwilling to remain in the destined profession; and his father's connections enabled him to exchange it for that of a newspaper critic and reporter. His first engagement was on the 'True Sun,' from which he transferred his services to the 'Morning Chronicle,' then almost the leading daily newspaper in London. His abilities as a reporter and describer of scenes of city-life soon raised him high in the staff of this journal; and probably there could have been no better training for his peculiar talents of observation, whether of scenes or of physiognomies and characters, than his occupation as a reporter afforded him. His *début* as a literary artist was made in the columns of the 'Morning Chronicle,' to the evening edition of which he contributed those 'Sketches of Life and Character' which were afterwards (1836) published collectively in two volumes under the title of 'Sketches by Boz.' Almost simultaneously with the 'Sketches' Mr. Dickens published 'The Village-

Coquettes: a comic opera' (1836). The success of the 'Sketches' was so great, and they showed the possession of such an original vein of humorous narrative and description, that the late Mr. Hall, of the firm of Chapman and Hall, London publishers, proposed to Mr. Dickens to write a story, in the same vein, to be brought out in monthly parts. Mr. Hall, we believe, even suggested as a suitable plan for such a story, that of describing the meetings and adventures of a club of originals. Acting on this hint, though he soon dropped the machinery of a club, or made it subordinate, Mr. Dickens produced his world-famous 'Pickwick Papers,' published in 1837. The success was beyond all calculation; and Mr. Dickens,—who about this time married the daughter of Mr. George Hogarth, a music writer and critic of eminence—at once took his place, at the age of twenty-five, as the most popular novelist of the day. 'Oliver Twist,' a novel in three volumes, was his next publication (1838); contemporaneous with which were 'The Memoirs of Joseph Grimaldi,' edited by Boz, in two volumes. Then, in the same serial form as 'Pickwick,' came 'The Life and Adventures of Nicholas Nickleby' (1839); followed by 'Master Humphrey's Clock,' published in weekly numbers in 1840 and 1841, and containing the stories since known separately as 'The Old Curiosity Shop,' and 'Barnaby Rudge: a Tale of the Riots of 1780.' After the conclusion of this publication Mr. Dickens visited America, where he was received with enthusiasm. His impressions of America and the Americans he published on his return in his 'American Notes for General Circulation' (1842). In 1843 was written his little Christmas book, entitled 'A Christmas Carol'—the first of that series of beautiful Christmas stories with which he has from time to time varied his larger publications.

In 1844 appeared, as a monthly serial, 'The Life and Adventures of Martin Chuzzlewit,' and in the same year he visited Italy and resided there for some time. His second Christmas book, 'The Chimes,' appeared in 1845. On January 1, 1846, Mr. Dickens presented himself in a new capacity, as the chief editor of 'The Daily News,' then organised as a liberal morning newspaper, with a numerous staff of select writers to support it by their united talents. Here appeared Mr. Dickens's 'Pictures of Italy,' afterwards published collectively (1846). After some time however Mr. Dickens resigned his editorship, and the organisation of the paper was changed. The same year, 1846, saw the publication of his 'Battle of Life: a Love-Story,' and 'The Cricket on the Hearth: a Fairy Tale for Christmas.' His next venture was his 'Dealings with the Firm of Dombey and Son,' commenced in the favourite form of a monthly serial in 1847, and finished in 1848, in time to permit the publication of a Christmas story for that year, called 'The Haunted Man and the Ghost's Bargain.' Next came the 'History of David Copperfield' in numbers, concluded in 1850. In this year Mr. Dickens started the weekly literary periodical, which he has since conducted under the title of 'Household Words,' and his own contributions to which during so many years must of themselves amount to a considerable body of literature. Here appeared his 'Child's History of England,' since republished in three volumes (1852-53), and the powerful story called 'Hard Times,' since re-published in one volume (1854). In 1853 was concluded another of his larger serial stories, 'Bleak House;' and while we write (1856) his 'Little Dorrit' is in progress.

Any commentary on the genius of a writer, whose works are so well known as those of Mr. Dickens is here unnecessary. Wherever the English language is spoken or read his name is a 'household word;' of many of his works there are translations into the chief European languages; and, though English literature should go on increasing in bulk for centuries to come, his place in it is secure. We may note however in connection with his influence on the history of our literature, *first*, his great effects as the founder of a new style of English novel, differing from that of Richardson, from that of Fielding, from that of Scott, and from that of any other preceding writer, with perhaps the exception, to a certain extent, of De Foe; *secondly*, his effects on the *form* of popular publications, as the first eminent practitioner of the serial form of narrative. Mr. Dickens's voluminousness as an author is also to be noted. Nor is it only as an author that he impresses his contemporaries. He is known as a man taking a lively interest in many social and philanthropic questions, and proving the same by his public conduct, as well as by the zealous criticisms of social wrongs and abuses with which his books abound, and which he has on many occasions enforced with great effect by his speeches on public occasions.

DICTYS, a Cretan who accompanied Idomeneus to the siege of Troy, and the reputed author of a history of the Trojan war, of which a Latin prose translation is still extant. This work, according to the Introduction prefixed to the Latin translation, was discovered in the reign of Nero, in a tomb near Gnossus, which was laid open by an earthquake. It was written in Phœnician characters, and translated into Greek by one Euxaridas, or Praxias, at the command of Nero: this translation has not come down to us; the Latin version which we possess is attributed to Quintus Septimius, who lived in the 3rd or 4th century A.D., and contains the first five books, with an abridgment of the remainder. The story related above does not seem worthy of much credit, but there is little doubt that the work is very ancient, though its exact date is uncertain. The best edition is that by Perizonius (1702, 8vo), to whose preliminary dissertation the reader is

referred for further particulars respecting the historian and his translator.

DIDEROT, DENYS, was born at Langres, in the province of Champagne, in 1713. His father, a master cutler, a worthy man, much respected in his native town, and comfortable in his circumstances, placed his son first in the Jesuits' College at Langres, and afterwards sent him to the College d'Harcourt at Paris to continue his studies. At one time young Diderot was intended for the church, but as he felt no inclination for the clerical profession, his father did not press the point. Diderot made some progress in the ancient and modern languages, and still more in mathematics. On leaving college his father placed him as a boarder with a Paris procureur, in order that he might study the law, but Diderot had no taste for that profession; he made no progress in its study, and he employed all the time he could steal from the office-desk in reading any books that fell into his hands. After two or three years his father stopped his board wages, desiring him either to betake himself to some profession or to return home, and he several times repeated the offer of this alternative, but to no purpose, as Diderot replied that he felt no inclination for any worldly profession; that he loved reading, was happy, and wanted nothing more. For ten years from that time he lived obscurely in Paris, on his wits as the phrase is, and often, as it may be supposed, in very promiscuous company. Literature was not then a very marketable commodity, but Diderot had a facility in writing, and he undertook anything that came in his way, advertisements, indexes, catalogues, and even sermons for the colonies, which were bespoken and paid for by a missionary. He next began translating from the English for the booksellers. He also received indirectly assistance from home. At the age of twenty-nine he married a young woman as poor as himself, who proved to him ever after a virtuous and affectionate wife, notwithstanding his subsequent neglect of her. In his drama 'Le Père de Famille' he has drawn from life some of the incidents of his courtship and marriage.

Diderot's first original work was the 'Pensées Philosophiques,' 1746, a desultory and rather common-place production, which however met with great success among the partisans of the new philosophy, as it was then called. From that time he ranked as one of the most strenuous assailants of the established systems in religion and politics. He saw many unseemly parts in the social edifice, and could devise no better mode of mending them than by pulling down the whole. That the state of France under the Regent and Louis XV. was such as easily to lead an impetuous mind to such a conclusion, is made sufficiently evident by the numerous memoirs of those times. In 1749 he published the 'Lettres sur les Aveugles,' for which he was imprisoned for three months at Vincennes, where however he was very indulgently treated, and allowed to receive the visits of his friends, among whom was J. J. Rousseau, to whom it is said that Diderot suggested the idea of his first literary paradox. They afterwards quarrelled upon some foolish ground, and the squabble was not creditable to either. [ROUSSEAU.] After editing, in company with others, a Universal Medical Dictionary, Diderot formed the project of a general Cyclopædia, to supersede the French version of Chambers's work, and he found a bookseller, Lebreton, willing to undertake the publication, under the title of 'Encyclopédie, ou Dictionnaire Raisonné des Sciences, des Arts, et Métiers.' Diderot and D'Alembert were joint editors, but D'Alembert withdrew after a time, and Diderot remained sole editor. The work began to appear in 1751, and was concluded in 1765, in 17 vols. fol., besides 11 vols. of plates. The publication was stopped two or three times by the government, and the last volumes were distributed privately, though the king himself was one of the purchasers. The most amusing part of the correspondence of Voltaire and D'Alembert was carried on while D'Alembert was joint editor of the 'Dictionnaire,' and presents a lively picture of the various difficulties with which the editors had to contend. On this celebrated compilation Diderot himself passed a severe judgment. He said, "that he had had neither time nor the means of being particular in the choice of his contributors, among whom some were excellent, but most of the rest were very inferior; that moreover the contributors, being badly paid, worked carelessly; that, in short, it was a patch-work composed of very ill-sorted materials, some master-pieces by the side of schoolboys' performances; and that there was also considerable neglect in the arrangement of the articles, and especially in the references." Diderot complained likewise that the publisher, Lebreton, often took upon himself to scratch out of the proof-sheets any passages which he thought might endanger him, and then filled up the gap as well as he could. Notwithstanding all these deficiencies the 'Dictionnaire Encyclopédique' met with great success for a time, but it has been since superseded in France by the 'Encyclopédie Méthodique,' or great French Cyclopædia.

The works of Diderot are numerous, and many of them were not published till after his death. Among those published in his lifetime are; 'Lettres sur les Sourds et Muets,' 1751; 'Pensées sur l'Interprétation de la Nature,' 1754; 'Code de la Nature,' 1755. The principal faults of his didactic compositions are obscurity in the ideas, and a declamatory style. Among his tales, 'Jacques le Fataliste' and 'Le Neveu de Rameau,' a posthumous publication, are still popular. 'Les Bijoux Indiscrets,' are a series of obscene stories, which he sold to a publisher, and gave the money to his mistress, Madame de Puisieux. He afterwards

formed a connection with Mdle. Voland, it seems, which lasted till his death. His letters to her form the principal part of the 'Mémoires, Correspondance, et Ouvrages Inédits de Diderot,' published in 1831, 4 vols. 8vo. Diderot's notions on the sexual connection may be seen in the article 'Marriage,' in the 'Dictionnaire Encyclopédique,' as well as in several of his 'Ouvrages Inédits.' He professed a strict sense of honour, and was generous and kind, though hasty, touchy, and suspicious. An estimate of his character may be formed not from the reports of his admirers or enemies, and there were many of both, but from his own works, and especially his correspondence, and also from a well-written and apparently unsophisticated memoir of his life by his daughter, Madame de Vandeuil, which is printed at the head of the unedited correspondence above mentioned. A collection of his principal works was published by his disciple Naigeon, in 15 vols., 8vo, 1798, and reprinted since in 22 vols., 8vo, Paris, 1821, with a life of the author by Naigeon himself, which however is rather a dissertation on Diderot's writings and opinions than a real biography. His last work, a life of Seneca, of which he published a second edition enlarged, in 2 vols., under the title of 'Essai sur les Règles de Claude et de Néron,' is considered by some one of his best compositions. It has been said of him that there are many good passages in all his works, though he never wrote a single entirely good work. Marmontel, Garat, and others of his contemporaries preferred his conversation greatly to his writings.

Diderot had not grown rich by his literary labours; he was getting old, and he thought of selling his library. Catharine of Russia hearing of his intention, purchased it at its full value, and moreover settled upon him a handsome pension as librarian to keep it for her, of which pension she paid him fifty years in advance in ready money. Full of gratitude, Diderot resolved to go and thank his benefactress in person. He went first to Holland, where he spent some months, and thence to St. Petersburg. He was delighted with his reception by the empress, and wrote to Mdle. Voland that "while in a country called the land of freemen he felt as a slave; but now in a country called the country of slaves, he felt like a freeman." ('Correspondance Inédite,' vol. iii., lettre 138.) After a short stay at St. Petersburg, he returned to Paris, where the empress hired a splendid suite of apartments for him in the Rue Richelieu. "He enjoyed his new lodgings only twelve days: he was delighted with them; having always lodged in a garret, he thought himself in a palace. But his body became weaker every day, although his head was not at all affected, and he was quite conscious that his end was approaching. The evening before his death he conversed with his friends upon philosophy, and the various means of attaining it. 'The first step towards philosophy,' said he, 'is incredulity.' This remark is the last which I heard him make."—('Memoir of Diderot,' by his daughter)—and it was a very characteristic one. Next day, 30th of July 1784, he got up, sat down to dinner with his wife, and afterwards expired without a struggle. Diderot was one of the principal members of the Holbach coterie, and the leader of that knot of literary sceptics known in the last century by the name of Encyclopédistes. There are many particulars concerning Diderot in his friend Grimm's 'Correspondance Littéraire,' Paris, 1812.

DIDIUS JULIANUS, of a family originally from Milan, and grandson of Salvius Julianus, a celebrated jurist, was born about A.D. 133. He was educated by Domitia Lucilla, the mother of Marcus Aurelius. He soon rose to important offices, was successively Quæstor, Prætor, and Governor of Belgic Gaul, and having defeated the Chauci, he obtained the Consulship. He was afterwards sent as governor to Dalmatia, and next to Germania Inferior. Under Commodus, he was governor of Bithynia: on his return to Rome, he lived in luxury and debauchery, being enormously rich. After the murder of Pertinax in 193, the Prætorians having put up the empire to auction, Didius proceeded to their camp, and bid against Sulpicianus, the father-in-law of Pertinax, who was trying to make his own bargain with the soldiers.

Coin of Didius.

British Museum. Actual size. Copper. Weight 355 grains.

Didius having bid highest, was proclaimed, and was taken by the soldiers into Rome. The senate with its usual servility acknowledged him emperor, but the people openly showed their dissatisfaction, and loaded him with abuse and imprecations in the Circus when he assisted at the solemn games which were customary on the occasion of a new reign. He is said to have borne the insult with patience, and to have behaved altogether with great moderation during his

short reign. Three generals at the head of their respective legions, Pescennius Niger, who commanded in the East, Septimius Severus in Illyricum, and Claudius Albinus in Britain, refused to acknowledge the nomination of the Prætorians. Severus being proclaimed Augustus by his troops, marched upon Rome, and found no opposition on the road, as the towns and garrisons all declared for him. The Prætorians themselves forsook Didius, and the senate readily pronounced his abdication, and proclaimed Severus emperor. A party of soldiers making their way into the palace, and disregarding the entreaties of Didius, who offered to renounce the empire, cut off his head. He had reigned only sixty-six days. Severus soon after entered Rome, put to death the murderers of Pertinax, disarmed the Prætorians, and banished them from the city. (Spartianus in *Historia Augusta*; Dion, *Epitome*, B. 78.)

* DIDRON, ADOLPHE-NAPOLEON, born at Hauteville, department of Marne, France, in March 1806, has devoted his life to the extension of the study of mediæval Christian art, and particularly of its symbolism, on which subject he is regarded as the chief living authority. M. Didron first examined personally most of the remarkable mediæval monuments of France, and in particular those of Normandy; and then, in order to compare the art of the Eastern Church with that of the West, he extended his researches to Greece, and he made himself familiar with all attainable mediæval manuscripts. As early as 1838 he delivered in the Bibliothèque Royale a course of lectures on Christian Iconography, and he gave a similar course on his return from Greece in 1840. He founded in 1845 an archaeological library at Paris, and a manufacture of painted glass for ecclesiastical purposes. In 1853 he was appointed by the Minister of Instruction secretary of the 'Comité Historique des Arts et Monuments,' and he drew up the elaborate reports issued by the committee. He has been from its commencement the editor of the '*Annales Archéologiques*,' and has contributed numerous articles on Christian archaeology to various periodicals. He has also published a '*Manuel d'Iconographie Chrétienne, Grecque et Latine, avec une Introduction et des Notes par M. Didron, traduit du MS. Byzantin*,' Par., 8vo, 1845. But his chief work is the '*Iconographie Chrétienne*,' 4to, Par., 1843. This is a perfect treasure-house of information on this very curious subject, but it unfortunately remains incomplete, only the first section, the '*Histoire de Dieu*,' being yet published. This portion has been translated into English by Mrs. Millington, and forms a volume of Bohn's '*Illustrated Library*.'

DIDYMUS, a celebrated grammarian, the son of a seller of fish at Alexandria, was born in the consulship of Antony and Cicero, B.C. 63 (Suidas, sub v.), and lived in the reign of Augustus. Macrobius calls him the greatest grammarian of his own or any other time. (Saturn. v. 22.) According to Athenæus (iv. p. 139, C.) he published 3500 volumes, and had written so much that he was called the forgetter of books (*βιβλιολάθης*), for he often forgot what he had written himself; and also the man with bowels of brass (*χαλκέντερος*), from his unwearied industry. To judge from the specimens of his writings given by Athenæus, we need not much regret the loss of them. His criticisms were of the Aristarchian school (Suid.): he wrote, among other things, an explanation of the Agamemnon of Ion (Athen. xi. p. 418, D.), and also of the plays of Phrynichus (Id. ix. p. 371, F.); several treatises against Juba, king of Libya (Suid. 'Ιδίας), a book on the corruption of diction (Athenæus, ix. p. 363, B.), a history of the city Cabesus (Steph. Byz. sub v. 'Αγδύπορος), besides essays on the country of Homer, the mother of Æneas, and other equally unimportant subjects. The '*Scholia Minora*' on Homer have been attributed to him, but wrongly, for Didymus himself is quoted in these notes. The collection of proverbs extant under the name of Zenobius was partly taken from a previous collection made by Didymus, and about sixty fragments of his fifteen books on agriculture are preserved in the collection of Cassianus Bassus.

Suidas mentions several other authors of this name, and among them one surnamed Ateius, who was an Academic philosopher, and wrote a treatise in two books on the solutions of probabilities and sophisms. We may also mention Didymus 'the blind,' an Alexandrian father of the church, who was born about the year B.C. 308, and was the teacher of St. Jerome, St. Isidore, Rufinus, and others. He died in B.C. 395. Of his numerous writings, four treatises have come down to us. 1, 'On the Holy Spirit.' 2, 'On the Trinity.' 3, 'Against the Manicheans.' 4, 'On the Canonical Epistles.' A Greek Treatise on Friary by another Didymus is also extant.

DIEBITSCH-SABALKANSKI, HANS KARL FRIEDRICH ANTON, COUNT VON DIEBITSCH AND NARDEN, was born on May 13, 1786, at Grosseleppa in Silesia. His father had been major and aid-de-camp under Frederick the Great in the Seven Years' war, but subsequently entered the Russian service, and attained the rank of major-general. In 1797 the son entered in the corps of cadets at Berlin, but joined his father in 1801. He was attached to the grenadier guards in the Russian service, with which he made the campaign of 1805, and was wounded in the hand at the battle of Austerlitz. After the battle of Friedland he was promoted to the rank of captain. The peace that ensued gave him leisure to pursue his military studies, and in 1812, on the invasion of the French, he was appointed quartermaster-general to Wittgenstein's corps, and distinguished himself by the recapture of Polock, a service of great

importance to the army, and for which he was made major-general. In conjunction with general Yorck, who commanded a part of the Prussian army, with whom he had held a secret correspondence, and whose desertion greatly accelerated the fall of Napoleon, he took possession of Berlin. After the battle of Lutzen he was sent to join Barclay de Tolly's army in Silesia, and commissioned to conclude the secret treaty of Reichenbach between Russia, Austria, Prussia, and England, which was completed on June 14, 1813. He was present at the battle of Dresden, where he had two horses shot under him, and also at that of Leipzig, when he was created lieutenant-general at the same time with Tolly and Paskewitch. In 1814 he opposed strongly the hesitation of the allies to march towards Paris, for which, when they met at Montmartre, the Emperor Alexander embraced him, thanked him, and bestowed on him the order of St. Alexander Newski.

On the return of Bonaparte from Elba he was despatched to Vienna as chief of the imperial staff, with the first division of the army, but he was soon recalled to take the office of adjutant-general, and attached to the person of the emperor. In 1820 he was named chief of the imperial staff, accompanied Alexander to Taganrog, and saw him die. On his return to St. Petersburg, during the revolt that followed the announcement of Alexander's death, he displayed the talents of a statesman and of an experienced soldier. Nicolas then sent him to Constantine at Warsaw, to announce and explain the occurrence at St. Petersburg, and on his finally accepting the crown created him a count. In the war against Turkey, in 1828-9, he gained great reputation by his conquest of Varna; and being raised to the chief command in February 1829, he largely increased it by the passage of the Balkan, for which he received his additional titles of Sabalkanski, meaning 'beyond the Balkan,' and the rank of field-marshal. He advanced to Adrianople, when, by the efforts of the diplomatists, the treaty of Adrianople was concluded. This saved his army, which had suffered terribly. He next visited Berlin, and it was rumoured with the intention of quitting the Russian service and re-entering that of his native country. However, the insurrection of Poland recalled him to head a Russian army, and he passed the frontiers of that country on January 25, 1831, but his powers were failing. After the sanguinary battle of Ostrolenka he transferred his head-quarters to Kleczewo, near Pultusk, and there he died from an attack of cholera on June 9, 1831. His corpse was conveyed to St. Petersburg and interred with much pomp, but his heart was deposited in the cathedral church of Pultusk.

DIEPENBECK, ABRAHAM VAN, a distinguished Dutch historical painter of the Flemish school, was born at Hertogenbosch (Bois-le-Duc) about 1607 according to Descamps, but probably earlier. He was already a good painter on glass when he entered the school of Rubens at Antwerp, in which he was the fellow-pupil of Vandyck; and he is the scholar who is said to have been pushed against the great picture of the 'Taking Down from the Cross,' when wet, the consequent damage to which was so admirably repaired by Vandyck. Diepenbeck lived at two periods with Rubens, before and after a visit to Rome, but in the second period more in the capacity of assistant than scholar. He was one of the best of Rubens's scholars, especially in composition and in colour: in design he was never excellent; he was too hasty in his execution. He had however a great reputation at Antwerp, and in 1641 was elected director of the academy there, an office which he held until his death in 1675.

Diepenbeck came to England in the time of Charles I., and was employed by William Cavendish, duke of Newcastle, to make the pictures for his book on horsemanship, some of which in Walpole's time were still exhibited in the hall at Welbeck.

Diepenbeck's works are very numerous, but they consist chiefly of designs made for booksellers. Heineken has given a long list of the engravings after them in his Dictionary. One of his principal works is a series of fifty-nine designs, published in 1655 at Paris, under the title of '*Tableaux du Temple des Muses*,' with illustrated letter-press by the Abbé Marolles: the subjects are from Ovid's '*Metamorphoses*,' and the engravings are executed by Bloemart, Matham, and other eminent engravers. There are several later editions and imitations of it.

His oil paintings on canvass are scarce: some pass probably as the works of Rubens; but there are still many of his painted windows in the churches of Antwerp. Houbraken says Diepenbeck was the best painter on glass of his time.

(Houbraken, *Groote Schouburg der Nederlandsche Konstschilders*, &c.; D'Argenville, *Abregé de la Vie des plus fameux Peintres*; Descamps, *Vies des Peintres Flamands*, &c.; Heineken, *Dictionnaire des Artistes*, &c.; Walpole, *Anecdotes of Painting*, &c.)

DIES, ALBERT, a landscape-painter and engraver, was born at Hanover in 1755. He learnt the first drudgery of painting under an obscure artist of Hanover, with whom he spent three years; at the expiration of this period he visited Düsseldorf for a year, whence he went to Rome in 1775, with thirty ducats in his pocket, a donation from the royal treasury. At Rome he attracted the notice of the celebrated Piranesi and of the Earl of Bristol, who wished to make a second Salvator Rosa of Dies, but the painter preferred sketching from nature to copying or to imitating the works of the gloomy Neapolitan: his favourite retreats were about Albano and Tivoli.

Dies remained several years in Rome, but in the meanwhile paid a visit to Naples. He also published a set of landscape-etchings in Rome, executed in company with some other German artists. He returned with a Roman wife to Germany in 1796, and established himself at Vienna, where he obtained a great reputation, notwithstanding a nervous debility which he had brought on by taking whilst in Rome some solution of sugar of lead in mistake for a medicine which he was using. His right side was so much affected by this nervous debility, that he was forced to give up entirely the use of his right hand, and he painted for some years with his left. He was at length forced to give up painting altogether, and his only remaining resource was poetry, in the composition of which he always indulged. He was also a musical composer, and he performed with skill upon several instruments. Besides several minor pieces upon the arts, he was the author of a comic didactic poem entitled 'Der Genius der Kunst.' A few of his musical compositions have been published, and he wrote a biography of Joseph Haydn. He died at Vienna in 1822, after an illness of thirteen years.

(*Archiv für Geschichte, &c.*, 1825; Nagler, *Neues Allgemeines Künstler-Lexicon*.)

DIETRICH, JOHANN WILHELM ERNST, one of the most distinguished German painters of the 18th century, was born at Weimar in 1712. His father, Johann Georg Dietrich, who was his first instructor, was court-painter at Weimar, and painted portraits, battles, and genre pictures with considerable success. In his twelfth year his father sent him to Dresden to study under Alexander Thiele, a celebrated landscape-painter, and he attended at the same time the Academy of Dresden. Dietrich rapidly distinguished himself; and in 1780, when only eighteen years of age, he was presented at Dresden to Augustus III., king of Poland, who appointed him his court-painter. He found at the same time a generous and valuable patron in Count Brühl, for whom he painted much in his house at Grochwitz, since destroyed: the count granted him an annual pension of 400 dollars, or 60*l.* sterling.

In 1741 Dietrich was appointed his court-painter by Augustus III., king of Poland; and in 1748 he was sent by the same king to prosecute his studies at Rome, but he remained there only one year. In 1746 he received an appointment in the picture gallery, with a salary of 400 rix-dollars per annum; and when the Academy of Arts of Dresden was established in 1763, Dietrich was appointed one of the professors, with a salary of 600 rix-dollars, and he was at the same time made director of the school of painting in the porcelain manufactory at Meissen. He died at Dresden in 1774, aged 62, and is supposed to have hastened his death by his incessant application to his art; for, notwithstanding an extremely rapid execution, he was an indefatigable painter, and laboured at his easel with little intermission till within the last few years of his life, when his weak state of health rendered it physically impossible. Dietrich had no original power. He painted in various styles, and copied any master with surprising exactness. He was most able however as a landscape-painter; but his views were generally arbitrary compositions, well coloured, transparent, and effectively lighted. He often painted in imitation of the style of some celebrated master—Everdijgen, Poelenburg, Berghem, or Claude—and on all occasions the imitations were excellent. He copied also with equal facility the style of Raffaele, Correggio, Mieris, and Ostade. He likewise repeatedly imitated the style of Rembrandt both in paintings and in etchings, especially in religious pieces, but with somewhat less licence as to the costume and the proportions of the human figure.

Dietrich painted also many rustic pieces, and pieces in the style and manner of Watteau. Two collections of etchings by him have been published, which are very scarce, especially the first; the second, consisting of eighty-seven plates, was published after his death, retouched by and under the direction of Zingg. Some of his etchings are signed 'Dietrich,' and others 'Dietricy'; the earlier ones are marked with the former name. There are also many prints after his works by other masters.

There are twenty-seven of Dietrich's pictures in the Royal Gallery at Dresden, and there is a good collection of his drawings and sketches in the collection of prints there.

(*Musiel, Miscellaneum Artistichen Inhalts*; Heineken, *Nachrichten von Künstlern, &c.*; and *Dictionnaire des Artistes, &c.*)

DIGBY, GEORGE, EARL OF BRISTOL, was born in 1612 at Madrid, where his father John, earl of Bristol, was then ambassador. He was educated at Magdalen College, Oxford, travelled in France, and in 1640 entered public life as one of the knights of the shire for Dorsetshire. From this time his career was marked by that uninterrupted series of clever inconsistencies which make his life like a novel and his character a riddle. Neither his character nor the incidents of his history can be adequately understood, unless from a full collection of particulars. Such a collection will be found in the very long memoir of him given in the 'Biographia Britannica.' After distinguishing himself in the House of Commons as a member of the opposition, he suddenly joined the court in the middle of Strafford's trial; afterwards he advised the seizure of the six members, and was one of the most violent of the king's imprudent advisers. Compelled to leave England, he served in the French wars of the Fronde, where he gained high reputation, but behaved so intriguingly as to be

cashiered; and next, seeking service with the king of Spain, he embraced the Roman Catholic religion, against which he had formerly written a treatise. After the restoration he returned to England, and sat in the House of Lords, where he, a Roman Catholic, spoke and voted in favour of the Test Act. Another of his most prominent public appearances was his impeachment of Lord Clarendon in 1663. This able but eccentric and useless man died at Chelsea on the 20th of March 1677. His literary character is not more than respectable. His principal works are several speeches, a good many letters, a translation of the first three books of the French romance of 'Cassandra,' and a lively play called 'Elvira, or the Worst not always True,' a Comedy, written by a Person of Quality,' which was licensed and printed in 1667, and is reprinted in Dodsley's 'Old Plays.'

DIGBY, EVERARD, was born in 1581 of an ancient, honourable, and wealthy family. His father, who was a Roman Catholic and a man reputed for learning, died in 1592, leaving the estates at Tilton and Drystoke in Rutlandshire to his son, the charge of whose education he had committed to some priests of his persuasion. In 1596 Everard married the only daughter and heiress of William Mulsho, or Moulsoe, of Gouthurst in Buckinghamshire, whose parents dying soon after the marriage, he acquired a large estate in right of his wife. In 1603 he was knighted by James I. at Belvoir Castle, which the king visited in his journey from Scotland to London to take possession of the throne.

The share which Sir Everard Digby took in the Gunpowder Plot is the sole cause of his celebrity. This conspiracy was projected when he was twenty-four years old: the oath of secrecy was administered and the design communicated to him by Catesby about Michaelmas 1605. When Digby first heard of the plot he was averse to it, but forbore to reveal it on account of his oath; afterwards, when he found that it was approved by Roman Catholic priests, the religious scruples which he had entertained were removed, and he united cordially in the project, contributing towards its execution a quantity of horses, arms, and ammunition, together with 1500*l.* in money. Digby was not concerned in the preparation of the vault; the share of the plot that was allotted to him was to assemble a number of the Roman Catholic gentry on the 5th of November, at Dunchurch in Warwickshire, under the pretence of hunting on Dunsmoor Heath, from which place, as soon as they had received notice that the blow was struck, a party was to be despatched to seize the Princess Elizabeth at the house of Lord Harrington, near Coventry. The princess was to be immediately proclaimed queen in case of a failure in securing the person of the Prince of Wales or the young Duke of York, and a regent was to be appointed during the minority of the new sovereign. Digby assembled his party, and rode to Lady Catesby's at Ashby Ledgers to hear the result of the scheme. In the evening five of the party arrived, fatigued and covered with dirt, with news of the discovery of the plot and the apprehension of Fawkes. A short consultation was held as to what was best to be done; and it was agreed to traverse the counties of Warwick, Worcester, and Stafford into Wales, where it was thought that they should find many adherents, exciting as they went along the Roman Catholic gentry to join them in a general insurrection. They carried off fresh horses in the night by stealth from the stable of a breaker of cavalry horses in Warwick; they seized arms at Lord Windsor's residence at Whewell; and on the 7th occupied a house at Holbeach belonging to Stephen Littleton. But all hope of accession to their numbers was at an end. "Not one man," says Sir Everard Digby in his examination, "came to take our part, though we had expected so many." The Roman Catholic gentry drove them from their doors, reproaching them with having brought ruin and disgrace on the Catholic cause by their ill-advised enterprise; while the common people stood and gazed upon their irregular train, and evinced anything but a disposition to join them. Sir Everard Digby forsook his companions at Holbeach, with the intention, as he stated, of hastening some expected succours: he was overtaken at Dudley, apprehended, and conveyed to London. On Monday, the 27th of January 1605-06, he was tried, with his fellow-conspirators. No doubt of their guilt was entertained, though written depositions only were given in by the prisoners, and no witness was orally examined: Digby alone pleaded guilty. They were executed on the following Thursday. Sir Everard Digby has been described by Greenway as profound in judgment and of a great and brilliant understanding, but we distrust this partial writer: he appears throughout this transaction rather as a weak and bigoted young man, never acting upon his own judgment or impulse, but submitting himself entirely to the control and guidance of the Jesuits. (Abridged from the *Library of Entertaining Knowledge*, 'Criminal Trials,' vol. ii.)

DIGBY, KENELME, the son of Sir Everard Digby, was born in 1603, three years before his father's execution. He was educated in the Protestant faith, and sent to Oxford at the age of fifteen, having been entered at Gloucester Hall. His ability was early apparent, and when he had left the university in 1621 with the intention of travelling, he had acquired considerable reputation. After having spent two years in France, Spain, and Italy, he returned to England in 1623, and was knighted at Lord Montague's house, Hinchinbroke, near Huntingdon, in October in the same year. Under Charles I. he was a gentleman of the bed-chamber, a commissioner of the navy, and a governor of the Trinity House. In 1628 he obtained the king's

permission to equip, at his own expense, a squadron, with which he sailed first against the Algerines, and afterwards against the Venetians, who had some dispute with the English. His conduct as a commander was creditable to him. Upon the death of Dr. Allen of Gloucester Hall in 1633, Sir Kenelme Digby became possessed of a valuable collection of books and manuscripts, which were bequeathed to him by his former tutor. The religious principles that he had imbibed under this learned man could not have been deeply rooted; for when Digby returned to France he was converted (1636) to the religion of his parents. His conversion was the subject of a long correspondence with Archbishop Laud, who had always taken an interest in Digby on account of his unusual ability and learning.

He returned to England in 1638. On the breaking out of the civil war he was imprisoned as a Royalist in Winchester House: during his confinement he wrote a refutation of Brown's '*Religio Medici*,' which occupied him until the petitions made by the queen of France for his relief were granted, and he was allowed to retire to that country. At Paris he was kindly treated by the court; and he became familiar with the celebrated Descartes, and associated with the principal men of learning. When the Royalist party had broken down, and ceased to be formidable, Digby went home to England, with the intention of residing upon his estate, but the parliament hearing of his return, forbade him the kingdom under penalty of death. The cause of this severity was the zeal which his eldest son had shown in the king's service, when, in 1648, with the Duke of Buckingham and others, he made a stand near Kingston in Surrey. Young Digby was afterwards killed by Colonel Scroop in Huntingdonshire. Sir Kenelme now again travelled in France and Italy, and was everywhere received as a man of extraordinary merit. In 1655 his personal affairs required his presence in England; and during his stay, his frequent attendance at the Protector's court was in no small degree inconsistent with his prior conduct. The feelings which had led him to fight the duel in which he killed Lord Mount le Ros, because he had drank Charles's health as the "arrantest coward upon earth," were now pretty nearly obliterated. During a subsequent residence in the south of France he read many papers on different philosophical questions before literary societies, of which he was a member. This course he afterwards followed in England, whither he returned in 1661, and passed the remainder of his life. He died of the stone in 1665. Sir Kenelme Digby married Venetia Anastasia Stanley, daughter of Sir Edward Stanley of Tongue Castle in Shropshire, a lady more celebrated for her beauty than her virtue. Sir Kenelme showed great anxiety to preserve her beauty: he invented cosmetics for that purpose, and made her the subject of several strange experiments. There are pictures of her by Vandyke, one of which is now in Windsor Castle. She died suddenly, leaving one son by her husband.

Sir Kenelme Digby, though he fell into the errors of philosophy and many of the wild dreams which were common in his day, was certainly possessed of no ordinary talents: for his character we must refer our readers to Lord Clarendon ('*Life*,' vol. i. p. 34), who has ably described it. The following is a list of his writings:—'*A Conference with a Lady about the choice of a Religion*,' Paris, 1638; '*Letters between Lord George Digby and Sir Kenelme Digby concerning Religion*,' Lond. 1651; '*Observations on Religio Medici*,' Lond. 1643; '*Observations on part of Spenser's Fairy Queen*,' Lond. 1644; '*Treatise on the Nature of Bodies*,' Paris, 1644; '*A Treatise on the Soul, proving its immortality*,' Paris, 1644; '*Five Books of Peripatetic Institutions*,' Paris, 1651; '*A Treatise of adhering to God*,' Lond. 1654; '*Of the cure of wounds by the Powder of Sympathy*,' Lond. 1658; '*Discourse on Vegetation*,' Lond. 1661; and what is now the most valuable as well as interesting of his writings, '*Private Memoirs of Sir Kenelm Digby*,' &c. Written by Himself. Now first published from the original MS., with an Introductory Memoir. By Sir N. Harris Nicolas, 8vo, Lond. 1827. Sir Kenelme Digby's valuable library, which had been removed to France at the out-breaking of the civil wars, became, on his death, by Droit D'Aubaine, the property of the French king.

DIGGES, LEONARD, a distinguished mathematician of the 16th century, was descended from an ancient family in the county of Kent. He was born at Digges-court, in the parish of Barham, in the same county. He was educated at Oxford; but having an ample property, he retired to his own seat, devoting his life to the study of geometry and its practical applications, which he cultivated with great success. He died in 1574. His writings abound with invention, and his views are developed with great perspicuity and clearness; but the subjects on which he wrote, and the improvements which he made, being now familiar to all practical mathematicians, any account of them beyond the titles of the works which he wrote would be superfluous here.

1. '*Tectonicum*,' briefly showing the exact Measuring and speedy Reckoning of all manner of Lands, Squares, Timber, Stones, Steeples, &c. 4to, 1556. This was enlarged and improved in a second edition by his son Thomas Digges, in 1592; and this again was reprinted in 1647. 2. A geometrical and practical treatise, under the title of '*Pantometria*,' in three books; which he left in manuscript, and which was printed with improvements by his son; fol., 1591. To this was added by the editor, '*A Discourse Geometrical of the Five Regular and Platonic Bodies*, containing sundry Theoretical and

Practical Propositions arising from the mutual Conference of these Solids, Inscription, Circumscription, and Transformation.' Before this time geometers had but little extended the investigations contained in the 15th book of Euclid; and this curious treatise contained the most ample collection of properties that appeared in any book before the time of the publication of Abraham Sharpe's '*Geometry Improved*.' 3. '*Prognostication Everlasting of Right Good Effect; or Choice Rules to judge of the Weather by the Sun, Moon, Stars, &c.*' 4to, 1555, 1556, and 1564. Also with corrections and additions by his son; 4to, 1592.

DIGGES, THOMAS, the only son of Leonard Digges. He was educated by his father with great care, and afterwards at Oxford, where he much distinguished himself; and ultimately became one of the first mathematicians of his age.

He chose the military profession, and was appointed muster-master-general to the forces sent out by Queen Elizabeth to succour the oppressed inhabitants of the Netherlands. Of his military career however no other evidence is known to exist except his writings on the subject. These prove that he must have given considerable attention to the details of his profession, and therefore have been a considerable period in active service. He died in 1595. The following is a list of his published writings, independently of editing his father's works:—1. '*Alma sive Scale Mathematica*,' 4to, 1573: a curious work. 2. '*A Letter on Parallax*,' printed in Dee's '*Parallatice Commentationis praxeosque nucleus quidam*,' 4to, 1573. 3. '*An Arithmetical Military Treatise*, containing so much of arithmetic as is necessary towards military discipline,' 4to, 1579. 4. '*An Arithmetical Warlike Treatise*, named *Stratiticoe*, compendiously teaching the science of numbers as well in fractions as integers, and so much of the rules and equations algebraical, and art of numbers cosical, as are requisite for the profession of a souldier; together with the moderne militaire discipline, offices, laws, and orders in every well-governed campe and armie, inviolably to be observed,' 4to, 1590. 5. '*A brief and true Report of the proceedings of the Earl of Leicester, for the Relief of the town of Sluice, from his arrival at Vliashing, about the end of June 1587, untill the surrender thereof, 26 Julii ensuing*, whereby it shall plainly appear his excellencie was not in anie fault for the surrender of that towne:' published with the last, 1590. 6. '*A brief Discourse what orders were best for repulsing any forraigne forces, if at anie time they should invade us by sea in Kent or elsewhere*:' published with the two last, 1590. 7. '*A perfect Description of the Celestial Orbs according to the most ancient doctrine of the Pythagoreans*.' This was published as a supplement to his edition of his father's '*Prognostication Everlasting*,' 4to, 1592. 8. '*A humble Motive for Association to maintain the Religion Established*,' 8vo, 1601. To this is added a letter to the archbishops and bishops to enforce the same object. 9. '*England's Defence; or a treatise concerning invasion*:' written in 1599, but not published. It is essentially a second edition of the tract already spoken of in the *Stratiticoe*.

Digges wrote many other works, which he left in manuscript, and which were never published, on account, it is stated, of the perplexity created by lawsuits in which he was engaged. The accomplished politician and elegant writer, SIR DUDLEY DIGGES (born 1583, died 1639), was the eldest son of Thomas Digges. The work by which he is chiefly remembered is the collection of letters which passed between the ministers of Elizabeth respecting her projected marriage with the Duc d'Anjou, and which was published after his death (1655), under the title of the '*Compleat Ambassador*.'

* DILKE, CHARLES WENTWORTH, who has been intimately associated with the literature of his time, was born on the 8th of December 1789. In early life he entered the Navy Pay Office as a clerk; and while there became a contributor to several of the reviews and magazines. A valuable collection of '*Old English Plays*,' in 6 vols., was edited by Mr. Dilke in 1814. After a long service in the Navy Pay Office, when some alterations were effected by consolidating several divisions, he retired on a pension. He then became proprietor, by purchase, of the '*Athenæum*,' a literary journal, which had been for some time struggling to preserve its existence. His first step was to reduce the price from one shilling to fourpence, and by his judicious management he gradually succeeded in rendering it a popular and influential journal, and ultimately a valuable property. Much of the reputation of this literary paper has been derived from Mr. Dilke's constant and judicious superintendence, although the laborious duties of editor have been recently discharged by others, among whom has been Mr. T. K. Hervey, who held the office from 1846 to about the end of 1853. Mr. Dilke's researches in curious points of literary history, such as the authorship of '*Junius*,' occasionally appear in papers of the '*Athenæum*.'

* CHARLES WENTWORTH DILKE (Mr. Dilke's son), was one of the earliest and most active among the originators of the Great Industrial Exhibition of 1851, and he was appointed one of the executive committee. His knowledge, taste, and unwearied industry contributed largely to the success of this undertaking. For his services he declined any pecuniary reward, and also preferred to remain without the honour of knighthood.

DINARCHUS (*Διναρχος*), one of the Greek orators, for the explanation of whose orations Harpocration compiled his lexicon.

Dinarchus was a Corinthian by birth, who settled in Athens and became intimate with Theophrastus and Demetrius the Phalerian, a circumstance which, combined with others, enables us to determine his age with tolerable precision. Dionysius of Halicarnassus fixes his birth about the archonship of Nicophemus, B.C. 361. The time of his highest reputation was after the death of Alexander, when Demosthenes and other great orators were dead or banished. He seems to have got his living by writing speeches for those who were in want of them, and he carried on apparently a profitable business this way. After the garrison which Cassander had placed in Munychia had been driven out by Antigonus and Demetrius in the archonship of Anaxicrates, B.C. 307, Dinarchus, though a foreigner, being involved in a charge of conspiring against the democracy, and having always been attached to the aristocratical party, and perhaps also fearing that his wealth might be a temptation to his enemies, withdrew to Chalcis in Eubœa. Demetrius afterwards allowed him to return to Athens with other exiles, in the archonship of Philippus, B.C. 292, after an absence of fifteen years. On his return, Dinarchus, who had brought all his money back with him, lodged with one Proxenus, an Athenian, a friend of his, who however (if the story is true) proved to be a knave, and robbed the old man of his money, or at least colluded with the thieves. Dinarchus brought an action against him, and for the first time in his life made his appearance in a court of justice. The charge against Proxenus, which is drawn up with a kind of legal formality, is preserved by Dionysius of Halicarnassus. How the suit ended is unknown. Of the numerous orations of Dinarchus only three remain, and they are not entitled to very high praise. One of them is against Demosthenes touching the affair of Harpalus. [DEMOSTHENES.] Dionysius has taken great pains to distinguish the spurious from the genuine orations of Dinarchus. Of his genuine orations, he enumerates 28 public orations and 31 private. This critic has passed rather a severe judgment on Dinarchus. He considered him merely as an imitator of Lysias, Hyperides, and Demosthenes, and though succeeding to a certain extent in copying the several styles and excellences of these three great orators, yet failing, as all copiers from models must fail, in that natural expression and charm which are the characteristics of originality.

The few facts that we know about Dinarchus are derived from the Commentary of Dionysius on the Attic orators and the extracts which he gives from Philochorus. The three extant orations of Dinarchus are printed in the usual collections of the Attic orators. The best separate edition is that of Schmidt, Leipzig, 1826.

* DINDORF, WILHELM, was born in 1802 at Leipzig, where his father was professor of Oriental languages. He distinguished himself early at the university, became while yet a youth the associate of many of his learned countrymen, and in 1819 edited a continuation of the commentaries of Aristophanes, commenced by Beck. He was appointed custos of the royal library at Berlin in 1827, and professor of literary history at Leipzig in 1828, but after giving a course of lectures in 1830, he in the following year resigned that office to unite with L. and M. Hase in remoulding the Greek 'Thesaurus' of Stephanus, and he has since mainly devoted himself to editing the Greek and Latin authors. One of his most celebrated editions is that of Demosthenes, which he edited for the University of Oxford (9 vols. 8vo), the text of which is considered very excellent. For the same university he has also edited *Æschylus* (3 vols., 1833-51), *Sophocles*, *Euripides* (3 vols.), *Aristophanes* (4 vols., 1835-39), &c.; many of the volumes of the 'Bibliothèque des Classiques Grecs' published in Paris by M. Didot, and others issued from the presses of Leipzig, &c. The labours of Dindorf have met with severe criticism, but it is evident that they must also have found acceptance among scholars. His texts are perhaps on the whole more highly esteemed than his commentaries. His brother * LUDWIG DINDORF (born 1805) has been associated with him in many of his scholastic undertakings, and has edited alone several Greek authors. He is said to have turned his attention of late years to commercial pursuits, and to have become connected with the railways of his native country.

DIOCLE, a Greek mathematician, who is chiefly known by his invention of the cissoid. The period at which he flourished is unknown.

DIOCLETIANUS, CAIUS VALERIUS, was born at Diocles, in Dalmatia, some say at Salona, about A.D. 245 according to some, but others make him ten years older. His original name was Diocles, which he afterwards changed into Diocletianus. He is said by some to have been the son of a notary, by others the freedman of a senator named Anulinus. He entered the army at an early age, and rose gradually to rank; he served in Gaul, in Moesia under Probus, and was present at the campaign against the Persians, in which Carus perished in a mysterious manner. Diocletian commanded the household or imperial body-guards when young Numerianus, the son of Carus, was secretly put to death by Aper his father-in-law, while travelling in a close litter on account of illness, on the return of the army from Persia. The death of Numerianus being discovered after several days by the soldiers near Calchedon, they arrested Aper and proclaimed Diocletian emperor, who addressing the soldiers from his tribunal in the camp; protested his innocence of the death of Numerianus, and then upbraiding Aper for the crime, plunged his sword into his body. The new emperor observed to a friend that "he had

now killed the boar," punning on the word Aper, which means a boar, and alluding to the prediction of a soothsayer in Gaul, who had told him that he would become emperor after having killed a boar. (Vopiscus in 'Hist. Aug.') Diocletian, self-composed and strong-minded in other respects, was all his life an anxious believer in divination, which superstition led him probably to inflict summary punishment upon Aper with his own hands. He made his solemn entrance into Nicomedia in September, 284, which town he afterwards chose for his favourite residence. Carinus, the other son of Carus, who had remained in Italy, having collected a force to attack Diocletian, the two armies met at Margum in Moesia, where the soldiers of Carinus had the advantage at first, but Carinus himself being killed during the battle by his officers, who detested him for his cruelty and debauchery, both armies joined in acknowledging Diocletian emperor in 285. Diocletian was generous after his victory, and, contrary to the common practice, there were no executions, proscriptions, or confiscations of property; he even retained most of the officers of Carinus in their places. (Aurelius Victor.)

Diocletian on assuming the imperial power found the empire assailed by enemies in various quarters, on the Persian frontiers, on the side of Germany and of Illyricum, and in Britain; besides which a serious revolt had broken out in Gaul among the rural population, under two leaders who had assumed the title of emperor. To quell the disturbance in Gaul, Diocletian sent his old friend Maximianus, a native of Pannonia, and a brave but rude uncultivated soldier. Maximianus defeated the Bagaudi, for such was the name the rustic insurgents had assumed. In the year 286, Diocletian chose Maximianus as his colleague in the empire, under the name of Marcus Valerius Maximianus Augustus, and it is to the credit of both that the latter continued ever after faithful to Diocletian and willing to follow his advice. Maximianus was stationed in Gaul and on the German frontier to repel invasion; Diocletian resided chiefly in the East to watch the Persians, though he appears to have visited Rome in the early part of his reign. About 287 the revolt of Carausius took place. In the following year Maximianus defeated the Germans near Treviri, and Diocletian himself marched against other tribes on the Rhätian frontier; the year after he defeated the Sarmatians on the lower Danube. In the same year, 289, peace was made between Carausius and the two emperors, Carausius being allowed to retain possession of Britain. In 290 Maximianus and Diocletian met at Milan to confer together on the state of the empire, after which Diocletian returned to Nicomedia. The Persians soon after again invaded Mesopotamia and threatened Syria, the Quinquentiani, a federation of tribes in the Mauritania Cæsariensis, revolted, another revolt under one Achilleus broke out in Egypt, another in Italy under a certain Julianus. Diocletian thought it necessary to increase the number of his colleagues in order to face the attacks in the various quarters. On the 1st of March 292, or 291 according to some chronologists, he appointed Galerius as Cæsar, and presented him to the troops at Nicomedia. At the same time Maximianus adopted on his part Constantius called Chlorus. The two Cæsars repudiated their respective wives; Galerius married Valeria, Diocletian's daughter, adding to his name that of Valerianus; and Constantius married Theodora, daughter of Maximianus. Galerius was a native of Dacia, and a good soldier, but violent and cruel; he had been a herdsman in his youth, for which he has been styled, in derision, Armentarius. The two Cæsars remained subordinate to the two Augusti, though each of the four was entrusted with the administration of a part of the empire. Diocletian kept to himself Asia and Egypt; Maximianus had Italy and Africa; Galerius, Thrace and Illyricum; and Constantius had Gaul and Spain. But it was rather an administrative than a political division. At the head of the edicts of each prince were put the names of all the four, beginning with that of Diocletian. Diocletian resorted to this arrangement probably as much for reasons of internal as of external policy. For nearly a hundred years before, ever since the death of Commodus, the soldiers had been in the habit of giving or selling the imperial crown, to which any general might aspire. Between thirty and forty emperors had been thus successively made and unmade, many of whom only reigned a few months. By fixing upon four colleagues, one in each of the great divisions of the empire, each having his army, and all mutually checking one another, Diocletian put a stop to military insolence and anarchy. The empire was no longer put up to sale, the immediate and intolerable evil was effectually cured, though another danger remained, that of disputes and wars between the various sharers of the imperial power; still it was a smaller danger and one which did not manifest itself so long as Diocletian remained at the helm. Writers have been very free of their censure upon this emperor for parcelling, as they call it, the empire; but this was the only chance there was of preventing its crumbling to pieces. Italy, and Rome, in particular, lost by the change: they no longer monopolised the wealth and power of the world, but the other provinces gained. The empire was much too large for one single man or a single central administration, under the dwindled influence of the Roman name, and amidst the numerous causes of local dissension and discontent, private ambition, social corruption, and foreign hostility, that had accumulated for three centuries, since the time of Augustus.

The new Cæsars justified Diocletian's expectations. Constantius

defeated the Franks and the Alemanni, and soon after reconquered Britain. Galerius subjugated the Carpi, and transported the whole tribe into Pannonia. In the year 296, the Persians, under their king Narses, again invaded Mesopotamia and part of Syria. Galerius marched against them, but being too confident was defeated by superior numbers, and obliged to retire. On his meeting Diocletian, the emperor showed his dissatisfaction by letting Galerius walk for a mile, clad in purple as he was, by the side of his car. The following year Galerius again attacked the Persians, and completely defeated them, taking an immense booty. The wives and children of Narses, who were among the prisoners, were treated by Galerius with humanity and respect. Narses sued for peace, which was granted by Diocletian on condition of the Persians giving up all the territory on the right or western bank of the Tigris. This peace was concluded in 297, and lasted forty years. At the same time Diocletian marched into Egypt against Achilleus, whom he besieged in Alexandria, which he took after a siege of eight months, when the usurper and his chief adherents were put to death. Diocletian is said to have behaved on this occasion with unusual sternness. Several towns of Egypt, among others Busiris and Coptos, were destroyed. Constantine, the son of Constantius, who was educated at Nicomedia, accompanied the emperor in this expedition. Diocletian fixed the limits of the empire on that side at the island of Elephanta, where he built a castle, and made peace with the neighbouring tribes, called by some Nubes and by others Nabatae, to whom he gave up the strip of territory which the Romans had conquered, of seven days' march above the first cataract, on condition that they should prevent the Blemmyes and Ethiopians from attacking Egypt. Maximianus in the meantime was engaged in putting down the revolt in Mauritania, which he effected with full success. For several years after this the empire enjoyed peace, and Diocletian and his colleagues were chiefly employed in framing laws and administrative regulations, and in constructing forts on the frontiers. Diocletian kept a splendid court at Nicomedia, which town he embellished with numerous structures. He, or rather Maximianus by his order, caused the magnificent Thermae at Rome to be built, the remains of which still bear Diocletian's name, and which contained, besides the baths, a library, a museum, public walks, and other establishments.

In February 303 Diocletian issued an edict against the Christians, ordering their churches to be pulled down, their sacred books to be burnt, and all Christians to be dismissed from offices civil or military, with other penalties, exclusive however of death. Various causes have been assigned for this measure. It is known that Galerius had always been hostile to the Christians, while Diocletian had openly favoured them, had employed them in his armies and about his person; and Eusebius (*'Hist. Eccles.'* viii.) speaks of the prosperity, security, and protection which the Christians enjoyed under his reign. They had churches in most towns, and one at Nicomedia in particular under the eye of the emperor. Just before the edict was issued, Galerius had repaired to Nicomedia to induce Diocletian to proscripe the Christians. He filled the emperor's mind with reports of conspiracies and seditions. The imperial palace took fire, Constantine (*'Oratio ad Coetum Sanctorum'*) says, from lightning, and Galerius suggested to the emperor that it was a Christian plot. The heathen priests on their part exerted themselves for the same purpose. It happened that on the occasion of a solemn sacrifice in presence of the emperor, while priests were consulting the entrails of the victims, the Christian officers in the imperial retinue crossed themselves; upon which the priests declared that the presence of profane men prevented them from discovering the auspices. Diocletian who was very anxious to pry into futurity, became irritated, and ordered all his Christian officers to sacrifice to the gods under pain of flagellation and dismissal, which many of them underwent. Several oracles which he consulted gave answers unfavourable to the Christians. The church of Nicomedia was the first pulled down by order of the emperor. The rashness of a Christian who publicly tore down the imperial edict exasperated Diocletian still more: the culprit was put to a cruel death. Then came a second edict, ordering all magistrates to arrest the Christian bishops and presbyters, and compel them to sacrifice to the gods. This was giving to their enemies power over their lives, and it proved in fact the beginning of a cruel persecution, whose ravages were the more extensive in proportion to the great diffusion of Christianity during a long period of toleration. This was the last persecution under the Roman empire, and it has been called by the name of Diocletian. But that emperor issued the two edicts reluctantly and after long hesitation, according to Lactantius's acknowledgment: he fell ill a few months after, and on recovering from his long illness he abdicated. Galerius who had instigated the persecution, was the most zealous minister of it; the persecution raged with most fury in the provinces subject to his rule, and he continued it for several years after Diocletian's abdication, so that it might with more propriety be called the Galerian persecution. The countries under the government of Constantius suffered the least from it. (Eusebius, *'Hist. Eccl.'*; Lactantius, *'De Mort. Persecut.'*; and Constantine's *'Oration,'* above quoted, as given by Eusebius.)

In November of that year (308) Diocletian repaired to Rome, where he and Maximianus enjoyed the honour of a triumph, followed by festive games. This was the last triumph that Rome saw. The popu-

lace of that city complained of the economy of Diocletian on the occasion, who replied that moderation and temperance were most required when the censor was present. They vented their displeasure in jibes and sarcasms, which so hurt Diocletian that he left Rome abruptly in the month of December for Ravenna, in very cold weather. In this journey he was seized by an illness which affected him the whole of the following year, which he spent at Nicomedia. At one time he was reported to be dead. He rallied however in the spring of 305, and showed himself in public, but greatly altered in appearance. Galerius soon after came to Nicomedia, and it is said that he persuaded and almost forced Diocletian to abdicate. Others say that Diocletian did it spontaneously. On the 1st of May he repaired with his guards to a spot three miles out of Nicomedia, where he had thirteen years before proclaimed Galerius as Caesar, and there, addressing his officers and court, he said that the infirmities of age warned him to retire from power, and to deliver the administration of the state into stronger hands. He then proclaimed Galerius as Augustus, and Maximinus Daza as the new Caesar. Constantine, who has given an account of the ceremony, which is quoted by Eusebius in his life of that prince, was present, and the troops fully expected that he would be the new Caesar; when they heard another mentioned, they asked each other whether Constantine had changed his name. But Galerius did not leave them long in suspense; he pushed forward Maximinus and showed him to the assembly, and Diocletian clothed him with the purple vest, after which the old emperor returned privately in his carriage to Nicomedia, and immediately after set off for Salona in Dalmatia, near which he built himself an extensive palace by the sea-shore, in which he lived for the rest of his life, respected by the other emperors, without cares and without regret. Part of the external walls which inclosed the area belonging to his palace and other buildings still remain, with three of the gates, as well as a temple, which is now a church at Spalatro, or Spalato, in Dalmatia, a comparatively modern town, grown out of the decay of the ancient Salona, and built in great part within the walls of Diocletian's residence, from the name of which, 'Palatium,' it is believed that 'Spalato' is derived. At the same time that Diocletian abdicated at Nicomedia, Maximianus, according to an agreement between them, performed a similar ceremony at Milan, proclaiming Constantius as Augustus, and Severus as Caesar. Both Severus and Maximinus Daza were inferior persons, and creatures of Galerius, who insisted upon their nomination in preference to that of Maxentius and Constantine, whom Diocletian had at first proposed. Maximianus retired to his seat in Lucania, but not being endowed with the firmness of Diocletian he tried some time after to recover his former power, and wrote to his old colleague to induce him to do the same. "Were you but to come to Salona," answered Diocletian, "and see the vegetables which I grow in my garden with my own hands, you would no longer talk to me of empire." In his retirement he used to observe to his associates how difficult it is even for the best-intentioned man to govern well, as he cannot see everything with his own eyes, but must trust to others, who often deceive him. Once only he left his retirement to meet Galerius in Pannonia for the purpose of appointing a new Caesar, Licinius, in the room of Severus, who had died. Licinius however did not prove grateful, for after the death of Galerius in 311, he ill-treated his widow, Valeria, Diocletian's daughter, who then with her mother, Prisca, took refuge in the territories of Maximinus Daza. The latter offered to marry Valeria, but on her refusal exiled both her and her mother into the deserts of Syria, and put to death several of their attendants. Diocletian remonstrated in favour of his wife and daughter, but to no purpose, and his grief on this occasion probably hastened his death, which took place at his residence near Salona in July 312. In the following year his wife and daughter were put to death by order of Licinius.

Coin of Diocletian.

British Museum. Actual size. Copper. Weight 167½ grains.

Diocletian ranks among the most distinguished emperors of Rome; his reign of twenty-one years was upon the whole prosperous for the empire, and creditable to the Roman name. He was severe, but not wantonly cruel, and we ought to remember that mercy was not a Roman virtue. His conduct after his abdication shows that his was no common mind. The chief charge against him is his haughtiness in introducing the Oriental ceremonial of prostration into the Roman court. The Christian writers, and especially Lactantius, have spoken unfavourably of him; but Lactantius cannot be implicitly trusted. Of the regular historians of his reign we have only the meagre narratives of Eutropius and Aurelius Victor, the others being now lost; but notices of Diocletian's life are scattered about in various authors,

Libanius, Vopiscus, Eusebius, Julian in his 'Caesars,' and the contemporary panegyrist, Eumenes and Mamertinus. His laws or edicts are in the 'Code.' Among other useful reforms, he abolished the *frumentarii*, or licensed informers, who were stationed in every province to report any attempt at mutiny or rebellion, and who basely enriched themselves by working on the fears of the inhabitants. He also reformed and reduced the number of the insolent Praetorians, who were afterwards totally disbanded by Constantine.

DIODATI, JEAN, was born in Geneva in 1576, of a family originally from Lucca. His progress in learning was so rapid that Beza procured him to be appointed professor of Hebrew in the University of Geneva when he was but twenty-one years of age. In 1608 he was made pastor, or parish minister, and in the following year professor of theology. While travelling in Italy about 1608, he became acquainted at Venice with the celebrated Sarpi and his friend Father Fulgenzio, both antagonists of the Court of Rome, and there appears to have been some talk and correspondence between them about attempting a religious reform in Italy, but Sarpi's caution and maturer judgment checked the fervour of the other two. Diodati afterwards translated into French and published at Geneva Sarpi's 'History of the Council of Trent.' In consideration of his theological learning he was sent by the clergy of Geneva on several missions, first to the reformed churches in France, and afterwards to those of Holland, where he attended the Synod of Dort (1618-19), and although a foreigner, he was one of the divines appointed to draw up the acts of that assembly. He fully concurred in the condemnation of the Arminians, or Remonstrants as they were called. Diodati was also distinguished as a preacher; in his sermons he spoke with conscientious frankness, without any regard to worldly considerations. He published an Italian translation of the Bible in 1607, and afterwards a French translation, which was not completed till 1644, having met with considerable opposition from the clergy of Geneva. Diodati died at Geneva in 1649. He wrote also 'Annotationes in Biblia,' folio, Geneva 1607, which were translated into English, and published in London in 1648, and numerous theological and controversial works, among others, 'De Fictitio Pontificiorum Purgatorio,' 1619; 'De justa Secessione Reformatorum ab Ecclesia Romana,' 1628; 'De Ecclesia;' 'De Antichristo,' &c. Senebier, in his 'Histoire Littéraire de Genève,' gives a catalogue of Diodati's works. He also wrote an answer to the ecclesiastical assembly in London, in reply to letters addressed to him by some members of that assembly, and which was published in Newcastle in 1647. Diodati translated into French Edwin Sandy's 'Account of the State of Religion in the West,' Geneva, 1626.

DIODORUS, a Greek historian, was born at Agrigum in Sicily. ('Biblioth. Hist.,' lib. i. c. 5.) Our principal data for the chronology of his life are derived from his own work. It appears that he was in Egypt about the 180th olympiad, B.C. 60 ('Biblioth. Hist.,' i. c. 44, comp. i. c. 83); that his history was written after the death of Julius Caesar; that it ended with the Gallic war of that general; and that he spent thirty years in writing it. ('Biblioth. Hist.,' i. c. 4, comp. v. c. 21 and 25.) In addition to this, Suidas mentions that he lived in the time of Augustus, and he is named under the year B.C. 49 by Jerome in the 'Chronicle of Eusebius.' The title of the great work of Diodorus is the 'Historical Library,' or 'The Library of Histories;' and it would therefore seem to have been intended by the author as a compilation from all the different historical works existing in his time. It was divided by him into forty books, and comprehended a period of 1138 years, besides the time preceding the Trojan war. ('Biblioth. Hist.,' i. c. 5.) The first six books were devoted to the fabulous history anterior to this event, and of these the three former to the antiquities of barbarian states, the three latter to the archaeology of the Greeks. But the historian, though treating of the fabulous history of the barbarians in the first three books, enters into an account of their manners and usages, and carries down the history of these people to a point of time posterior to the Trojan war; thus in the first book he gives a sketch of Egyptian history from the reign of Menes to Amasis. In the eleven following books he detailed the different events which happened between the Trojan war and the death of Alexander the Great; and the remaining twenty-three books contained the history of the world down to the Gallic war and the conquest of Britain. ('Biblioth. Hist.,' i. c. 4.) Diodorus asserts that he bestowed the greatest possible pains on his history, and had travelled over a considerable part of Europe and Asia in order to prosecute his investigations with the greatest advantage. He resided some time at Rome, and having made himself familiar with the Latin language, was enabled to consult the Roman historians in the originals. He objects to the custom so common among Greek and Roman writers of interlarding their narratives with fictitious speeches, to which he says ('Biblioth. Hist.,' lib. xx. init.) they made the whole history a mere appendix, although he seems to have fallen into this fault in his twenty-first book (Niebuhr, 'Hist. Rom.,' iii, note 848); but, on the other hand, he thought it the duty of an historian never to omit a suitable opportunity of pronouncing merited praise or blame. ('Biblioth. Hist.,' lib. xi.) Of the forty books of Diodorus's 'History' we possess only fifteen, namely, books i. to v., and books xi. to xx.; but we have many fragments of the twenty-five others, to which important additions were a few years back made from manuscripts in the Vatican library.

With regard to the historical value of the 'Bibliotheca,' and the

merits of the author, the most discrepant opinions have been entertained by modern writers. The Spanish scholar Vives called him a mere trifler, and Jean Bodin accused him in no sparing terms of ignorance and carelessness; while, on the other hand, he has been defended and extolled by many eminent critics as an accurate and able writer. The principal fault of Diodorus seems to have been the too great extent of his work. It was not possible for any man living in the time of Augustus to write an unexceptionable universal history; and it is not therefore a matter of surprise that Diodorus, who does not appear to have been a man of superior abilities, should have fallen into a number of particular errors, and should have placed too much reliance on authorities sometimes far from trustworthy. Wherever he speaks from his own observations he may perhaps generally be relied on, but when he is compiling from the writings of others he has shown little judgment in his selection, and has in many cases proved himself incapable of discriminating between the fabulous and the true. In some instances, as in his account of Egypt (see 'Description of the Tomb of Osymandias'), it is impossible to say whether he is speaking as an eye-witness or upon the report of others. Although he professes to have paid great attention to chronology, his dates are frequently and obviously incorrect. (See Dodwell's 'Annal. Thucyd.,' and Clinton's 'Fasti Hellenici,' ii, p. 259 and elsewhere; Niebuhr, 'Hist. Rom.,' ii, and note 1281.) However, we are indebted to him for many particulars which but for him we should never have known; and we must regret that we have lost the last and probably most valuable portion of his works, as even by the fragments of them which remain we are enabled in many places to correct the errors of Livy. The style of Diodorus, though not very pure or elegant, is sufficiently perspicuous, and presents few difficulties, except where the manuscripts are defective, as is frequently the case. (Niebuhr, 'Hist. Rom.,' vol. iii, note 297, and elsewhere.)

The best editions of Diodorus are Wesseling's, Amstel, 1745, 2 vols. fol.; that printed at Deux-Ponts, 1798-1801; and Dindorf's, Lips., 1829-33, 6 vols. 8vo, which contains the Vatican Excerpta. There is also a smaller edition by Dindorf in 4 vols. 12mo, Lips., 1826. Diodorus has been translated into French by Terrasson, and a few years ago a new translation by Miot appeared at Paris. A German translation of Diodorus was begun by F. And. Stroth (1782-85), and finished by T. F. Sal. Kaltwasser (1786-87). Amyot translated into French books xi. to xvii. of Diodorus's 'History.'

DIOGENES, the Cynic philosopher, was the son of Hicseus, a money-changer of Sinope. His father and himself were expelled from their native place on a charge of adulterating the coinage, or, according to another account, Hicseus was thrown into prison and died there, while Diogenes escaped to Athens. On his arrival at that city, he betook himself to Antisthenes, the Cynic, who repulsed him rudely according to his custom, and even on one occasion threatened to strike him. "Strike me," said the Sinopian, "for you will never get so hard a stick as to keep me from you while you speak what I think worth hearing." The philosopher was so pleased with this reply that he at once admitted him among his scholars. Diogenes was soon distinguished for his extraordinary neglect of personal conveniences, and by a sarcastic and sneering petulance in all that he said. He was dressed in the coarse double robe, which served him as a cloak by day and a coverlet by night, and carried a wallet to receive alms of food. His abode was a cask in the temple of Cybele. In the summer he rolled himself in the burning sand, and in the winter clung to the images in the street covered with snow, in order that he might accustom himself to endure all varieties of weather. A great number of his witty and biting apophthegms are detailed by his namesake and biographer (Diog. Laërt., vi, c. 2.) He became acquainted with Alexander the Great, who bade him ask for whatever he wanted. "Do not throw your shadow upon me," was the Cynic's only request. It is reported that Alexander was so struck with his originality that he exclaimed, "Were I not Alexander, I would wish to be Diogenes." Being taken by a piratical captain named Scirpalus, while sailing from Athens to Ægina, he was carried to Crete, and there sold to Xenias, of Corinth, who took him home to educate his children. He discharged the duties of this situation so faithfully and so successfully, that Xenias went about saying that a good genius had come into his house; and he was so well treated by his master that he refused an offer on the part of his friends to ransom him from slavery. He spent his time principally in the Cranium, a gymnasium near Corinth, where he died in the same year, and, according to one account, on the same day, with Alexander the Great (B.C. 323), at the advanced age of ninety years. A number of works attributed to him are mentioned by Diogenes Laërtius, but none of them are extant. Generally he adhered to the doctrines of the Cynics, to which sect he belonged. The following are a few of the particular opinions ascribed to him by his biographer. He thought exercise (*ἀσκησις*) was indispensable, and able to effect anything; that there were two kinds of exercise, one of the mind and the other of the body, and that one of these was of no value without the other. By the cultivation of the mind he did not mean the prosecution of any science or the acquirement of any mental accomplishment; all such things he considered as useless; but he intended such a cultivation of the mind as might serve to bring it into a healthy and virtuous state, and produce upon it an effect analogous to that which exercise produces upon the body.

He adopted Plato's doctrine, that there should be a community of wives and children, and held with the Dorian lawgivers, that order (*adapev*) was the basis of civil government.

DIO'GENES of Apollonia, so called from his birthplace, a town in Crete, was a pupil of Anaximenes and a contemporary of Anaxagoras. The years in which he was born and died are not known, as is the case also with his master Anaximenes. But the birth-year of his contemporary and fellow-pupil Anaxagoras is known to be B.C. 500; and Diogenes would most probably be about the same age, or perhaps rather younger. Sidonius Apollinaris (xv. 91) speaks of Diogenes as younger than Anaxagoras. Schleiermacher, who is followed by Schaubach, the editor of the fragments of Anaxagoras, affirms from the internal evidence of the fragments of the two philosophers, that Diogenes preceded Anaxagoras. But Diogenes might have written before Anaxagoras, and yet have been his junior, as we know was the case with Empedocles. (Aristotle, 'Met.' i. iii, p. 843 B.)

Diogenes followed Anaximenes in making air the primal element of all things, that out of which the whole material universe was formed; but he invested this air with the property of intelligence, or with what is called by St. Augustin a divine virtue, thus approximating but not attaining to the system of Anaxagoras. It was reserved for this last philosopher to separate mind from matter. "As the contemplation of animal life," says Thirlwall, "had led Anaximenes to adopt air as the basis of his system, a later philosopher, Diogenes of Apollonia, carried this analogy farther, and regarded the universe as issuing from an intelligent principle, by which it was at once vivified and ordered—a rational as well as sensitive soul—still without recognising any distinction between matter and mind." ('Hist. of Greece,' vol. ii., p. 134.) Cicero ('De Nat. Deor.' i. 12) represents Diogenes as making air his deity.

He wrote several books on Cosmology; and the first sentence of his work is given by Diogenes Laërtius in two places (vi. 81; ix. 57). The fragments which remain have been recently collected and edited by Panzerbieter.

There is an essay on the philosophy of Diogenes, by Schleiermacher, in the Memoirs of the Berlin Academy for 1815; and a contribution to the chronology of his life in an article on the early Ionic philosophers, by Mr. Clinton, in the 'Philological Museum,' vol. i., p. 92.

(For general information concerning him the reader is referred to Diogenes Laërtius, ix. 9; Bayle, *Dictionary*; Fabricii, *Bibliotheca Græca*, ed. Harles, vol. ii., p. 656.)

DIO'GENES, surnamed Laërtius, because he was born at Laërtes, in Cilicia, is well known as the biographer of the Greek philosophers. But though he has described the lives of others, he has given us no account of himself, and we know nothing about him. It is supposed that he lived in the reign of Severus or Caracalla, and that he was an Epicurean. The work by which Diogenes is known is a crude contribution towards the history of philosophy. It contains a brief account of the lives, doctrines, and sayings of most persons who had been called philosophers; and though the author is evidently a most unfit person for the task which he imposed upon himself, and has shown very little judgment and discrimination in the execution, the book is useful as a collection of facts which we could not otherwise have learned, and entertaining as a sort of 'omniana' on the subject. The article on Epicurus is valuable as containing some original letters of that philosopher, which comprise a pretty satisfactory epitome of the Epicurean doctrines, and are very useful to the readers of Lucretius. The most convenient edition of Diogenes is that by H. G. Hübner, Lips., 1828-31, in 2 vols. 8vo. The commentaries of Casaubon, Menage, and others, on Diogenes Laërtius were printed in 2 vols. 8vo, 1831, uniformly with the edition of Hübner.

DION, surnamed Chrysostomus, or the Golden-mouthed, on account of the beauty of his style, the son of Pasircrates, a man of consideration at Prusa in Bithynia, was a sophist and stoic. He was in Egypt when Vespasian, who had been proclaimed emperor by his own army, came there, and was consulted by that prince on the proper course to be adopted under the circumstances. Dion had the candour, or, as some may think, the want of judgment, to advise him to restore the republic. Afterwards he resided for some years at Rome, till one of his friends, having engaged in a conspiracy against Domitian, was condemned to death, and Dion, fearing for himself, fled to the modern Moldavia, where he remained till the tyrant's death, labouring for his subsistence with his own hands, and possessing no books but the 'Phædon' of Plato and Demosthenes *repl. Παναγορας*. Domitian having been assassinated, the legions quartered on the Danube were about to revolt, when Dion got upon an altar and harangued them so effectually that they submitted to the decision of the senate. Dion was in high favour with Nerva and Trajan, and when the latter triumphed after his Dacian victories the orator sat in the emperor's car in the procession. He returned to Bithynia, where he spent the remainder of his life. Accusations of peculation and treason were brought against him, but rejected as frivolous. Dion died at an advanced age, but it is not known in what year. We have eighty orations attributed to him, which are very prettily written, but not of much intrinsic value. The best edition is that of Reiske, 2 vols. 8vo, Lips., 1784. The name Cocceianus, which Pliny ('Epist.' x. 85, 86) gives to Dion, probably refers to his connection with the emperor Cocceius Nerva.

DION CA'SSIUS COCCEIA'NUS, or Cocceius, was the son of Cassius Apronianus, a Roman senator, and born at Nicæ in Bithynia about A.D. 155. On his mother's side he was descended from Dion Chrysostom, and it was from this branch of his family that he took the name of Dion. Thus though he was on his mother's side of Greek descent, and though in his writings he adopted the then prevailing language of his native province, he must be considered as a Roman. Under Commodus he lived in Rome, where he enjoyed the rank of senator. After the death of Septimius Severus and Caracalla, under whom he held no public office, he was made governor of Smyrna and Pergamus by Macrinus. He was afterwards consul and proconsul in the provinces of Africa and Pannonia, probably under Alexander Severus (Suidas, *Διων*), who esteemed him so highly as to make him consul for the second time with himself. In his old age he is said to have returned to his native country. (Photius, 'Dion Cassius'.)

Dion wrote a history of Rome in Greek, from the arrival of Æneas in Italy and the foundation of Alba and Rome to A.D. 229. To the time of Julius Cæsar his history was only a rapid sketch, but from that date, and more particularly from the time of Commodus, when he is a contemporary writer, his narrative is very complete. Of the first 36 books there are only fragments extant; but there is a considerable fragment of the 35th book on the war of Lucullus against Mithridates, and of the 36th, on the war with the Pirates and the expedition of Pompey against Mithridates. The following books to the 54th inclusive are nearly all entire; they comprehend a period from B.C. 65 to B.C. 10, or from the eastern campaign of Pompey and the death of Mithridates to the death of Agrippa. The 55th book has a considerable gap in it. The 56th to the 60th, both included, which comprehend the period from A.D. 9 to 54, are complete, and contain the events from the defeat of Varus in Germany to the reign of Claudius. Of the following 20 books we have only fragments, and the meagre abridgment of Xiphilinus. The 80th or last book comprehends the period from A.D. 222 to 229, in the reign of Alexander Severus. The abridgment of Xiphilinus, as now extant, commences with the 35th and continues to the end of the 80th book: it is a very indifferent performance.

The fragments of the first 36 books, as now collected, are—1, those called 'Valesiana,' which were collected by Henri de Valois from various scholiasts, lexicographers, and grammarians; 2, the 'Fragment a Peiresiana,' taken from the great work or compilation of Constantinus Porphyrogenetus [BYZANTINE HISTORIANS]; 3, 'Fragment a Ursiniana,' also taken from the same compilation of Constantinus Porphyrogenetus; 4, 'Excerpta Vaticana,' by Mai, which contain fragments of books 1-35 and 61-80, have been published in the second volume of the 'Scriptorum Veterum Nova Collectio,' pp. 135-233. To these are added the fragments of an unknown continuator of Dion (pp. 234-246), which go down to the time of Constantine. Other fragments from Dion, belonging chiefly to the first 35 books, also published in the same collection (pp. 527-567), were found by Mai in two Vatican manuscripts, which contain a sylloge or collection made by Maximus Planudes.

The annals of Zonaras contain numerous extracts from Dion. Dion as an historian is not characterised by any great critical power or judgment; indeed his own remarks are sometimes trifling. His style is generally clear, though there are occasionally obscure passages where there appears to be no corruption in the text. His diligence is unquestionable, and from his opportunities he was well acquainted with the circumstances of the empire during the period for which he is a contemporary authority, and indeed we may assign a high value to his history of the whole period from the time of Augustus to his own age. Nor is his history without value for the earlier periods of Roman history, in which, though he has fallen into errors, like all the Greek and Roman writers who have handled the same obscure subject, he still enables us to correct some erroneous statements of Livy and Dionysius.

Other writings are attributed to Dion; among them a life of Arrian by Suidas.

The first edition of the Greek text of Dion was by R. Stephens, Paris, 1548, fol., from one manuscript, and that very incorrect and defective. Between this edition and that of Reimar there were several editions. J. Alb. Fabricius undertook a new edition of Dion, but dying before he had completed his labour, his papers came into the hands of H. S. Reimar, his son-in-law, who published the new edition at Hamburg, 1751-52, 2 vols. fol., with a Latin translation. The edition of Reimar is valuable, as he availed himself of the labours of all his predecessors, arranged the fragments in order, and improved the text and translation, to which he added notes. Some fragments were afterwards discovered in a manuscript in the library of St. Mark, by Morelli, and published by him at Bassano in 1798, 8vo. They were reprinted at Paris in 1800, fol., in a form to accompany the edition of Reimar. The small Tauchnitz print of Dion Cassius, 4 vols. 16mo, contains the fragments. The most recent, and perhaps most useful edition is by F. W. Sturz, Leipzig, 1824-25, 8 vols. 8vo; a ninth volume, published in 1843, contains the 'Excerpta Vaticana,' discovered and first published by Mai.

DION, of Syracuse, son of Hipparinus, one of the chief men in that city, lived under the reigns of both the Dionysii. He was originally introduced to Dionysius the Elder by his sister Aristomache, one of

the king's wives, but his own merit appears afterwards to have gained him so much favour at court that he could speak to Dionysius with the freedom of an equal. He had early become the disciple of Plato, whom Dionysius had invited to Syracuse, and Plato is said to have considered him the most ardent of his pupils. Soon after his accession the younger Dionysius began to show the effects of an imperfect and vicious education, while in private he abandoned himself to all kinds of excesses. The prospects of his country roused Dion, and he endeavoured to counteract the errors and to supply the deficiencies of the tyrant by prudent counsels and exhortations. Among other things he advised him to invite Plato to revisit the Syracusan court, setting forth the advantages which he would derive from his conversation and knowledge. Dionysius wrote a letter of invitation, but the philosopher had not forgotten the treatment which he had received from the tyrant's father, and it was with the utmost difficulty that he was prevailed on to go. The presence of Plato was dreaded by the dissolute courtiers who surrounded Dionysius, and to counteract any influence he might have, they obtained the recall of Philistus, whose talents and tyrannical tendencies they thought were likely to be a match for the philosopher. The enemies of Dion availed themselves of the same opportunity to insinuate suspicions of Dion's loyalty, and succeeded in procuring his banishment. He went first to Italy and then to Greece, where he received the highest honours. Dionysius however endeavoured to embitter his exile, and soon confiscated his lands and effects, and forced his wife to marry another person. Dion no sooner heard of this outrage, than he determined to make an effort to expel the tyrant. Though dissuaded by Plato, he began to raise troops privately, and at last assembled his forces to the number of about eight hundred in the island of Zacynthus, whence he sailed to Sicily. On landing, he found that Dionysius was absent in Italy, and he was accordingly received by the people with great joy. Dionysius at once returned to Sicily, and made some fruitless attempts to regain his influence, but after several defeats was forced to quit the island for Italy. Dion however did not long enjoy the favour of his countrymen, and by the influence of Heracleides, who estranged the minds of the people from him, he was obliged to leave Sicily; he was afterwards recalled, but was treacherously murdered, B.C. 354, at about fifty-five years of age, by his supposed friend Calippus, an Athenian. His death was generally regretted; and in honour of his high courage and patriotism a monument was raised to him at the public expense. (Diodorus Siculus, xvi. 6-20; Plutarch, *Life of Dion*; Nepos, *Life of Dion*.)

DIONYSIUS THE ELDER was born at Syracuse about B.C. 430. In the civil troubles of Syracuse, between the party of Diocles and that of Hermocrates, who was accused of aspiring to the supreme power, Dionysius took part with the latter, and was wounded in an attempt which Hermocrates made to take possession of Syracuse. He afterwards married the daughter of Hermocrates. Meantime the Carthaginians had effected their second invasion of Sicily, and had taken Selinus, Himera, and Agrigentum. (Xenophon, *Hellenika*, ii. 2.) All Sicily was in danger of falling into the hands of the conquerors. In the assembly of the people of Syracuse, convoked after the fall of Agrigentum, Dionysius accused the commanders and the magistrates of neglect and treachery. In consequence of this charge he was condemned to a heavy fine, which Philistus, the historian, paid for him, and he then repeated his charges against those who were at the head of the commonwealth, until he persuaded the people to change the military commanders, and appoint new ones, among whom himself was one. His next measure was to obtain the recall of the exiles, to whom he gave arms. Being sent to the relief of Gela, then besieged by the Carthaginians, he effected nothing against the enemy, pretending that he was not seconded by the other commanders, and his friends suggested that in order to save the state the supreme power ought to be confided to one man, reminding the people of the times of Gelon, who had defeated the Carthaginian host and given peace to Sicily. The general assembly proclaimed Dionysius supreme chief of the republic about B.C. 405, when he was twenty-five years of age. He increased the pay of the soldiers, enlisted new ones, and under pretence of a conspiracy against his person, formed a guard of mercenaries. He then proceeded to the relief of Gela, but failed in his attack on the Carthaginian camp; he however penetrated into the town, the inhabitants of which he advised to leave it quietly in the night under the escort of his troops. On his retreat he persuaded those of Camarina to do the same. This raised suspicions among his troops, and a party of horsemen, riding on before the rest, on their arrival at Syracuse raised an insurrection against Dionysius, plundered his house, and treated his wife so cruelly that she died in consequence. Dionysius, with a chosen body, followed close after, set fire to the gate of Acradina, forced his way into the city, put to death the leaders of the revolt, and remained undisputed possessor of the supreme power. The Carthaginians, being afflicted by a pestilence, made proposals of peace, which were accepted by Dionysius, on condition that they should retain, besides their old colonies, the territories of Agrigentum, Selinus, and Himera; that Gela and Camarina should be restored to the inhabitants, who were to pay tribute to the Carthaginians, and that Messana, Syracuse, Leontini, and the whole eastern division of the island as well as the towns of the Siculi, in the interior, should remain independent. Himilco with the Cartha-

ginian army returned to Africa, and Dionysius applied himself to fortify Syracuse, and especially the island Ortygia, which he made his stronghold, and which he peopled entirely with his trusty partisans and mercenaries, by the aid of whom he put down several revolts which broke out against him. He took, partly by stratagem and partly by force, the towns of Leontini, Catana, and Naxos, and subjected them to Syracuse. He next prepared for a new war against Carthage by collecting men from every quarter, manufacturing a large quantity of arms, and inventing new engines for besieging towns. The termination of the Peloponnesian war (B.C. 404) had filled the Greek towns of Sicily with emigrants and disbanded mercenaries, many of whom Dionysius enlisted in his service. In the year B.C. 397, he convoked a general assembly of the people and proposed the war, which was unanimously voted, and which was begun by the people plundering the houses and vessels of the Carthaginian traders. Dionysius sent a herald to Carthage, which was then afflicted by the plague, to declare war, unless all the Greek towns in Sicily were evacuated. He next laid siege to Motya, one of the principal Carthaginian colonies in Sicily, which his brother Leptines attacked by sea. In this siege he tried his new engines, which battered down the walls, and the town being taken, the inhabitants were either killed or sold, and an immense booty was made by the Syracusans. Dionysius reduced also the other towns belonging to the Carthaginians, except Panormos, Soloeis, and Egeste. Meantime the Carthaginians collected a large force under Himilco, who landed at Panormos, while his fleet took the island of Lipara; he then marched against Messana, which he took and destroyed; and thence advanced towards Syracuse. Most of the towns inhabited by the Siculi joined the Carthaginians. On arriving at Tauromenium Himilco found his way along the sea-coast, but was stopped by a great eruption of lava from Etna, and was obliged to march round by the western base of the mountain. Meantime Mago with the Carthaginian fleet attacked the Syracusan fleet off Catana, and completely defeated it. Himilco encamped under the walls of Syracuse, while his victorious fleet entered the great harbour. Dionysius, on his side, received ships and men from Sparta. A dreadful pestilence breaking out in Himilco's camp, Dionysius availed himself of it to attack the Carthaginians, defeated them, and burnt most of their ships. Himilco with the remainder escaped to Carthage, having paid secretly a large sum to Dionysius for his forbearance.

Dionysius settled the disbanded mercenaries as colonists at Leontini and Messana, which latter city he caused to be rebuilt. Mago, with a new Carthaginian army, having landed in Sicily, B.C. 392, was compelled to re-embark on condition of paying the expenses of the war. Dionysius now proceeded against Rhegium, with which the other towns of Magna Græcia had formed an alliance, while he gained over to his side the Lucanians, and both together defeated the allies, devastated the territories of Thurii, Croton, Caulon, Hipponium, and Locris, and obliged the Greeks to sue for peace. About this time he is said by Justinus, xx. 5, to have received an embassy from the Gauls, who had just burnt Rome, offering him their alliance. In B.C. 387 he again attacked Rhegium, and took it after a long and obstinate siege. He sold the surviving inhabitants as slaves, and put their commander to a cruel death.

Dionysius was now feared both in Italy and Sicily, and he seems to have aspired at one time to the dominion of both countries. In order to raise money he allied himself with the Illyrians, and proposed to them the joint plunder of the temple of Delphi: the enterprise however failed. He then plundered several temples, such as that of Proserpina, at Locris, and as he sailed back with the plunder with a fair wind, he, who was a humorist in his way, observed to his friends, "You see how the immortal Gods favour sacrilege." With these resources he was preparing himself for a new expedition to Italy, when a fresh Carthaginian armament landed in Sicily, B.C. 383, and defeated Dionysius, whose brother, Leptines, fell in the battle. A peace followed, of which Carthage dictated the conditions. The boundary of the two states was fixed at the river Halycus, and Dionysius had to pay 1000 talents for the expenses of the war. This peace lasted fourteen years, during which Dionysius remained the undisturbed ruler of Syracuse and one-half of Sicily, with part of Southern Italy. He sent colonies to the coasts of the Adriatic, and his fleets navigated both seas. Twice he sent assistance to his old ally, Sparta, once against the Athenians, B.C. 374, and again in 369, after the battle of Leuctra, when the Spartans were hard pressed by Epaminondas. Meantime the court of Dionysius was frequented by many distinguished men, philosophers and poets. Plato is said to have been among the former, being invited by Dion, the brother-in-law of Dionysius; but the philosopher's declamations against tyranny led to his being sent away from Syracuse. The poets fared little better, as Dionysius himself aspired to poetical glory, for which however he was not so well qualified as for political success. Those who did not praise his verses were in danger of being sent to prison. Dionysius twice sent some of his poems to be recited at the Olympic games, but they were hissed by the assembly. He was more successful at Athens. A tragedy of his obtained the prize, and the news of his success almost turned his brain. He had just concluded a fresh truce with the Carthaginians, after having made an unsuccessful attack upon Lilybæum at the expiration of the fourteen years' peace; and he now gave himself up

to rejoicings and feasting for his poetical triumph. In a debauch with his friends he ate and drank so intemperately that he fell senseless, and soon after died; some say he was poisoned, A.C. 367, in the sixty-third year of his age, having been tyrant of Syracuse thirty-eight years. After the death of his first wife he married two wives at once, namely, Doris of Locri, and Aristaneta, daughter of Hipparchus, of Syracuse: by these women he had seven children, of whom Dionysius, his elder son by Doris, succeeded him in the sovereignty.

Dionysius was a clever statesman, and generally successful in his undertakings; he did much to strengthen and extend the power of Syracuse, and it was probably owing to him that all Sicily did not fall into the hands of the Carthaginians after the taking of Agrigentum. He was unscrupulous, rapacious, and vindictive, but several of the stories stated of his cruelty and suspicious temper appear improbable, or at least exaggerated. The works of Philistus, who had written his life, and who is praised by Cicero, are lost. Diodorus, who is our principal remaining authority concerning Dionysius, lived nearly three centuries after, and was not a critical writer. The government of Dionysius, like that of many others who are styled tyrants in ancient history, was not a despotism; it resembled rather that of the first Medici and other leaders of the Italian republics in the middle ages, or that of the Stadtholders in Holland. The popular forms still remained, and we find Dionysius repeatedly convoking the assembly of the people on important occasions, when full freedom of speech seems to have been allowed.

Coin of Dionysius.

British Museum. Actual size. Silver. Weight 263 grains.

DIONYSIUS THE YOUNGER, son of Dionysius the Elder, succeeded him as tyrant of Syracuse, being acknowledged as such by the people. His father had left the state in a prosperous condition, but young Dionysius had neither his abilities nor his prudence and experience. He followed at first the advice of Dion, who, although a republican in principle, had remained faithful to his father, and who now endeavoured to direct the inexperienced son for the good of his country. For this purpose Dion invited his friend Plato to Syracuse about B.C. 364. Dionysius received the philosopher with great respect, and in deference to his advice reformed for a while his loose habits and the manners of his court. But a faction, led by Philistus, who had always been a supporter of the tyranny of the elder Dionysius, succeeded in prejudicing his son against both Dion and Plato. Dion was exiled under pretence that he had written privately to the senate of Carthage for the purpose of concluding a peace. Plato urgently demanded of Dionysius the recall of Dion, and not being able to obtain it, he left Syracuse, after which Dionysius gave himself up to debauchery without restraint. Aristippus, who was then at his court, was the kind of philosopher best suited to the taste of Dionysius. Dion meantime was travelling through Greece, where his character gained him numerous friends. Dionysius, moved by jealousy, confiscated his property, and obliged his wife to marry another. Upon this Dion collected a small force at Zacynthus, with which he sailed for Sicily, and entered Syracuse without resistance. Dionysius was absent at the time, but his adherents retired to the citadel in the Ortygia. Dionysius soon returned, and after some resistance, in which old Philistus, his best supporter, was taken prisoner and put to death, he quitted Syracuse, and retired to Locri, the country of his mother, where he had connections and friends.

After the murder of Dion [Dion] several tyrants succeeded each other in Syracuse, until Dionysius himself came and retook it about B.C. 346. Dionysius however, instead of improving by his ten years' exile, had grown worse; having usurped the supreme power in Locri, he had committed many atrocities, had put to death several citizens, and abused their wives and daughters. (Justinus, *Epitome*.) Upon his return to Syracuse, his cruelty and prodigality drove away a great number of people, who emigrated to various parts of Italy and Greece, whilst others joined Iketas, tyrant of Leontini, and a former friend of Dion. The latter sent messengers to Corinth to request assistance against Dionysius. The Corinthians appointed as leader of the expedition Timoleon, who had already figured in the affairs of his own country as a determined opponent of tyranny. Timoleon landed in Sicily B.C. 344, notwithstanding the opposition of the Carthaginians and of Iketas, who acted a perfidious part on this occasion; he entered Syracuse, and soon after obliged Dionysius to surrender. Dionysius was sent to Corinth, where he spent the remainder of his life in the company of actors and low women; some say that at one time he kept a school. Justin (*xii. 5*) says that he purposely affected low habits in order to disarm revenge, and that being despised, he might no longer

be feared or hated for his former tyranny. Several repartees are related of him in answer to those who taunted him upon his altered fortunes, which are not destitute of wit or wisdom.

(Plutarch, *Dion*; Diodorus, *xvi.*)

DIONYSIUS, the son of Alexander, an historian and critic, born at Halicarnassus in the first century B.C. We know nothing of his history beyond what he has told us of himself. He states (*'Antiq.'* p. 20-24) that he came to Italy at the termination of the civil war between Augustus and Antony (B.C. 29), and that he spent the following two-and-twenty years at Rome in learning the Latin language and in collecting materials for his history. (Phot. *'Biblioth.'* cod. lxxxvi.) He also says (*'Antiq.'* p. 1725) that he lived in the time of the great civil war. The principal work of Dionysius is his *'Roman Antiquities'*, which commenced with the early history of the people of Italy, and terminated with the beginning of the first Punic war, B.C. 265. (*'Antiq.'* i, p. 22.) It originally consisted of twenty books, of which the first ten remain entire. The eleventh breaks off in the year B.C. 312, but several fragments of the latter half of the history are preserved in the collection of Constantinus Porphyrogenetus, and to these a valuable addition was made in 1816 by Mai, from an old manuscript. Besides, the first three books of Appian were founded entirely upon Dionysius; and Plutarch's biography of Camillus must also be considered as a compilation mostly taken from the *'Roman Antiquities'*, so that perhaps upon the whole we have not lost much of this work. With regard to the trustworthiness and general value of Dionysius's history, considerable doubts may be justly entertained; for though he has evidently written with much greater care than Livy, and has studied Cato and the old annalists more diligently than his Roman contemporary, yet he wrote with an object which at once invalidates his claim to be considered a veracious and impartial historian. Dionysius wrote for the Greeks; and his object was to relieve them from the mortification which they felt at being conquered by a race of barbarians, as they considered the Romans to be; and this he endeavoured to effect by twisting and forging testimonies and botching up the old legends, so as to make out a *prima facie* proof of the Greek origin of the city of Rome, and he inserts arbitrarily a great number of set speeches, evidently composed for the same purpose. He indulges in a minuteness of detail which, though it might be some proof of veracity in a contemporary history, is a palpable indication of want of faith in the case of an ancient history so obscure and uncertain as that of Rome. With all his study and research, Dionysius was so imperfectly acquainted with the Roman constitution that he often misrepresents the plainest statements about it. (Niebuhr, *'Hist. Rome'*, vol. ii., p. 13, Engl. tr.) For instance, he imagines that the patricians had all the influence in the centuries, and that the plebeians and equites had nothing to do with the first class. (*'Antiq.'* vii. 82-87, x. 17. See Niebuhr, *'Hist. Rome'*, ii., p. 178, Engl. tr.) He thought the original constitution of Rome was a monarchical democracy, and calls the curies the *'demos'* (*δῆμος*). He believed when he wrote his second book that the decrees of the people were enacted by the curies and confirmed by the senate (*'Antiq.'* ii. 14), and not, as he afterwards discovered, the converse. (*'Antiq.'* vii. 83.) In a word, though the critical historian may be able to extract much that is of great importance for the early history of Rome from the garbled narrative and the dull trifling of Dionysius, he cannot be regarded as a meritorious writer, or recommended to the student of ancient history as a faithful guide. Dionysius also wrote a treatise on rhetoric; criticisms on the style of Thucydides, Lysias, Isocrates, Isæus, Dinarchus, Plato, and Demosthenes; a treatise on the arrangement of words, and some other short essays. His critical works are much more valuable than his history, and are indeed written with considerable power. The criticism on Dinarchus [DINARCHUS] displays good sense and judgment, and shows the great pains which the author took to separate the genuine writings of the Attic orators from the fabrications which passed under their name. The best edition of Dionysius is that of Reiske, *'Lips.'* 1774-1777, 6 vols., in 8vo. Mai's fragments were first published at Milan in 1816, and reprinted the following year at Frankfurt. They also appear in the second volume of Mai's *'Nova Collectio'*, Rome, 1827. His rhetoric has been published separately by Schott, Lips., 8vo, 1804; and his remarks on Thucydides by Krüger, Hal. Sax., 8vo, 1823.

DIONYSIUS of Byzantium lived before the year A.D. 106. His voyage (*'Analekta'*) in the Thracian Bosphorus was extant in the 16th century, for Gyllius, who died in 1555, has given extracts in Latin from it in his work on the *'Thracian Bosphorus'*. A single fragment from this work is printed in Ducange's *'Constantinopolis Christiana'*, and in Hudson's *'Minor Greek Geographers'*. Perhaps there is some confusion between this Dionysius and the author of the *'Periegesis'*, whom Suidas (*αὐτοβίος*) calls a Corinthian.

DIONYSIUS CATO. This is the name given to the author of a Latin work in four books entitled *'Dionysii Catonis Disticha de Moribus ad Filium'*. But the real name of the author is unknown, and also the time when he lived. It is admitted however that he lived before the time of the Emperor Valentinian. These *Disticha*, which are in verse, are short moral precepts intended for the edification of youth.

There was a work by M. Cato (probably the younger Cato) entitled *'Carmen de Moribus'*, from which Aulus Gellius (*xi. 2*) has given

several extracts; but it was not a poem, as some critics have falsely concluded from the word *Carmen*; for that word meant something expressed concisely, and did not necessarily imply any metrical arrangement of the words. The work of Cato seems mainly to have consisted of moral precepts, and the existence of such a work may have induced the writer or compiler of these Distichs to attach to it the name of Cato.

The style of these Distichs is simple, and the language generally pure. During the middle ages they were much used in the schools for the purposes of instruction, both on the continent of Europe and in England, and they have been used in some parts of England even to the present century.

The great number of editions shows the popularity which this little work once had. The earliest known edition is without date: a copy of it, apparently the only copy known to exist, is in the library of Earl Spencer. One of the latest and best editions is by Arntzenius, Utrecht, 8vo, 1735. There is a Greek translation of the Distichs by Maximus Planudes, which was published at Paris, 4to, 1543, Weigel. There are translations of the Distichs into many of the languages of Europe. Caxton published an English version of the Distichs, which was made from the French, folio, 1483. There are several English translations from the Latin, the latest of which perhaps is that of N. Bailey, 8vo, London, 1771.

(Bähr, *Geschichte Röm. Lit.*; Schweiger, *Handbuch der Classischen Bibliographie*.)

DIONYSIUS OF COLOPHON, a celebrated Greek painter, who lived in the time of Pericles. His works were known to Aristotle, who, in speaking of imitation, says, that it must be superior, inferior, or equal to its model, which he exemplifies by the works of three painters. Polygnotus, he says, painted men better than they are, Pauson worse than they are, and Dionysius as they are; by which we may infer that Dionysius was a good portrait painter. His style was laboured, as we learn from Plutarch, who states that his works had both force and spirit, yet they appeared to be too much laboured.

Polygnotus and Dionysius were contemporaries, and, according to Aelian, painted similar subjects in a similar style, except that Dionysius painted in small and Polygnotus in large. Aelian, in the passage alluded to, evidently refers to the styles of the two painters, and not their pictures; he says that Dionysius imitated in every respect, except in size, the art of Polygnotus. Nearly the same might be said of Garofolo with respect to his small works and the art of Raffaele, without implying that Garofolo copied in small the pictures of Raffaele, which is the interpretation given by Sillig and others to the words of Aelian, namely, that Dionysius copied in small the pictures of Polygnotus.

There was another painter of this name, who lived in Rome about the time of the first Roman emperors. Pliny states that his works filled picture-galleries. He was probably the same Dionysius who was called, according to Pliny, the 'Anthropograph,' because he painted nothing but men; some however think that it was Dionysius of Colophon who was so designated.

(Aristotle, *Poet.*, c. 2; Plutarch, *Timol.*, 36; Aelian, *Var. Hist.*, iv. 3; Pliny, *Hist. Nat.*, xxxv. 37, 40.)

DIONYSIUS PERIEGETES, the author of a Greek poem in 1186 hexameter verses, entitled *Τῆς Οἰκουμένης Περιήγησις*, or 'a description of the habitable world.' It is not known where Dionysius was born, nor where he lived. Perhaps the most probable opinion is, that he was a native of Byzantium and belonged to the latter part of the 3rd or the beginning of the 4th century A.D. As a poem the 'Periegesis' is of little value, and as a geographical work, not worth the trouble of reading. The commentary of Eustathius on the 'Periegesis' possesses some value for the miscellaneous information which is scattered through it. There are two Latin translations of this poem, one by Rufus Festus Avienus, and the other by Priscianus. There are numerous editions of Dionysius. The best edition of the 'Periegesis' is by G. Bernhardt, Leipzig, 8vo, 1828, in the first volume of his 'Geographi Græci Minores.'

DIOPHANTUS, a native of Alexandria, the exact date of whose birth is unknown, some authors asserting that he lived in the reign of Augustus, whilst others place him under Nero, or even the Antonines. The fact is that we do not know when he lived. He lived however, as is well ascertained, to eighty-four years of age.

Diophantus left behind him thirteen books of 'Arithmetical Questions,' of which however only six are extant; but from their distinct and peculiar character, in comparison with all the other writings of the Greek mathematicians, these books have given rise to much discussion. It is however scarcely to be conceived that whilst the cumbrous machinery of common language constituted the sole instrument of investigation, the very curious conclusions which we find in this work could have resulted from the researches of one single mind. To suppose that Diophantus was the inventor of the analysis which bears his name, is so contrary to all analogy with experience and the history of mental phenomena, as to be utterly impossible to admit. Still, if we inquire into the history of this branch of analysis, and ask who were the predecessors of Diophantus, or whether they were Greeks or Hindus, no satisfactory answer can be given. The question whether Diophantus was the original inventor, or whether he derived the original suggestion from India, will be noticed under *VIGA GANITA*.

Diophantus also wrote a book on 'Polygon Numbers' (*περὶ πολυγώνων ἀριθμῶν*). Holzmann published at Basel, in 1575, folio, a Latin translation of both the works of Diophantus. The first Greek edition was by Meziriac, Paris, 1621, folio; an improved edition of Meziriac's edition was published by S. de Fermat, Toulouse, 1670, folio. A valuable translation of the 'Arithmetical Questions' into German was published by Otto Schulz, Berlin, 1822, 8vo; to which is added Posseger's translation of the work on 'Polygon Numbers.'

DIOSCORIDES, PEDA'CIUS, or PEDA'NIUS, a Greek writer on materia medica, was born at Anazarbus, in Cilicia, and flourished in the reign of Nero, as appears from the dedication of his books to Aereus Asclepiadeus, who was a friend of the consul Licinius or Lecanius Bassus. In early life he seems to have been attached to the army; and either at that time or subsequently he travelled through Greece, Italy, Asia Minor, and some parts of Gaul, collecting plants with diligence and acquainting himself with their properties, real or reputed. He also gathered together the opinions current in his day concerning the medical plants brought from countries not visited by himself, especially from India, which at that time furnished many drugs to the western markets. From such materials he compiled his celebrated work on 'Materia Medica,' in five books, wherein between 500 and 600 medicinal plants are named and briefly described. He is moreover reputed the author of some additional books on therapeutics, &c.; but in the judgment of Sprengel the latter are spurious, and, from the mixture of Latin and Greek names of plants, are probably some monkish forgery.

Few books have ever enjoyed such long and universal celebrity as the 'Materia Medica' of Dioscorides. For sixteen centuries and more, to use the words of one of his biographers, this work was referred to as the fountain-head of all authority by everybody who studied either botany or the mere virtues of plants. Up to the commencement of the 17th century the whole of academical or private study in such subjects was begun and ended with the works of Dioscorides; and it was only when the rapidly increasing numbers of new plants and the general advance in all branches of physical knowledge compelled people to admit that the vegetable kingdom might contain more things than were dreamt of by the Anazarbian philosopher, that his authority ceased to be acknowledged.

This is the more surprising, considering the real nature of these famous books. The author introduced no order into the arrangement of his matter, unless by consulting a similarity of sound in the names he gave his plants. Thus, medium was placed with epimedium, althea cannabina with cannabis, hippophaestum (enicus stellatus) with hippophaë, and so on; the mere separation of aromatic and gum-bearing trees, esculents and corn-plants, hardly forms an exception to this statement. Of many of his plants no description is given, but they are merely designated by a name. In others the descriptions are comparative, contradictory, or unintelligible. He employs the same word in different senses, and evidently attached no exactness to the terms he made use of. He described the same plant twice under the same name or different names; he was often exceedingly careless, and he appears to have been ready to state too much upon the authority of others. Nevertheless, his writings are extremely interesting as showing the amount of materia medica knowledge in the author's day, and his descriptions are in many cases far from bad; but we must be careful not to look upon them as evidence of the state of botany at the same period, for Dioscorides has no pretension to be ranked among the botanists of antiquity, considering that the writings of Theophrastus, four centuries earlier, show that botany had even at that time begun to be cultivated as a science distinct from the art of the herbalist.

The most celebrated manuscript of Dioscorides is one at Vienna, illuminated with rude figures. It was sent by Basbequius, the Austrian ambassador at Constantinople, to Mathioli, who quotes it under the name of the 'Cantacuzene Codex,' and is believed to have been written in the 6th century. Copies of some of the figures were inserted by Dodoens in his 'Historia Stirpium,' and others were 'engraved in the reign of the Empress Maria Theresa, under the inspection of Jacquin; two impressions only of these plates, as far as we can learn, have ever been taken off, as the work was not prosecuted.' One of them is now in the Library of the Linnean Society; the other is, we believe, with Sibthorp's collection at Oxford. They are of little importance, as the figures are of the rudest imaginable description. Another manuscript of the 9th century exists at Paris, and was used by Salmasius; this also is illustrated with figures, and has both Arabic and Coptic names introduced, on which account it is supposed to have been written in Egypt. Besides these, there is at Vienna a manuscript believed to be still more ancient than that first mentioned, and three others are preserved at Leyden.

The first edition of the Greek text of Dioscorides was published by Aldus at Venice, in 1499, fol. A far better one is that of Paris, 1549, in 8vo, by J. Goupyl; but a better still is the folio Frankfurt edition, of 1598, by Sarracenus. Sprengel laments, "nullum rei herbarie peritum virum utilissimo huic scriptori operam impendisse." Nevertheless, there have been many commentators, of whom some, such as Fuchsius, Amatus Lusitanus, Ruellius, Tabernaemontanus, Tragus, and Dalechampius, are of no sort of authority, while others, especially Matthioli, Maranta, Cordus, John Bauhin, and Tournefort, among

the older, with Sibthorp, Smith, and Sprengel, among modern commentators, deserve to be consulted with attention. The last edition of the Greek text is by Sprengel, in the collection of 'Greek Physicians' by Kühn, Leipzig, 1829, 8vo, which has been improved by a collation of several manuscripts. Dr. Sibthorp, who visited Greece for the purpose of studying on the spot the Greek plants of Dioscorides, must be accounted of the highest critical authority; for it frequently happens that the traditions of the country, localities, or other sources of information, throw far more light upon the statements of this ancient author than his own descriptions. It will ever be a subject of regret to scholars, that Dr. Sibthorp should have died before he was able to prepare for the press the result of his inquiries; what is known of them is embodied in the 'Prodromus Floræ Græcæ,' published from his materials by the late Sir James Edward Smith, and in the 'Flora Græca' itself, consisting of 10 vols. fol., with nearly 1000 coloured plates, commenced by the same botanist, and since completed under the direction of Professor Lindley. [SIBTHORP.] So far as European plants are in question, we may suppose that the means of illustrating Dioscorides are now nearly exhausted; but it is far otherwise with his Indian and Persian plants. Concerning the latter, it is probable that much may still be learned from a study of the modern materia medica of India, though something has been collected by the researches of Dr. Royle. When the Nestorians, in the 5th century, were driven into exile, they sought refuge among the Arabs, with whom they established their celebrated school of medicine, the ramifications of which extended into Persia and India, and laid the foundation of the present medical practice of the natives of those countries. In this way the Greek names of Dioscorides, altered indeed, and adapted to the genius of the new countries, became introduced into the languages of Persia, Arabia, and Hindustan, and have been handed down traditionally to the present day. Thus Dr. Royle has shown, by an examination of this sort of evidence, that the *Kalamos aromatikos* of Dioscorides is not a Gentian, as has been imagined; that *Nardos Indike* is unquestionably the *Nardostachys Jatamansi* of De Candolle, and that the *Lukion Indikon* was neither a Rhamnus nor a Lycium, but as Prosper Alpinus long ago asserted, a Berberis. With regard to the last plant, Dr. Royle states that Berberis is at the present day called in India 'hoozis hindæ,' or Indian hoozis. This last word has for its Arabic synonym 'loofyon,' or 'lookyon;' therefore the Berberis is still called Indian lycium, with the reputed qualities and uses of which it moreover corresponds.

DIOSCURIDES (Διοσκουρίδης), a very celebrated ancient gem engraver who lived at Rome about the time of the Emperor Augustus. Augustus and later emperors were in the habit, according to Suetonius, of using a seal, representing Augustus's portrait, which was engraved by Dioscorides. There are still several gems extant which bear the name of Dioscorides, but the genuineness of most of them has been questioned; a few of them however are beautifully finished, and are perhaps worthy of the reputation of the greatest gem engraver of antiquity, a reputation which Dioscorides had, according to Pliny.

A Dioscorides of Samos was a worker in mosaic; two of his works have been discovered in Pompeii.

(Suetonius, *Augustus*, 50; Pliny, *Hist. Nat.* xxxvii. 4; Bracon, *Commentaria de Antiquis Sculptoribus*, &c.; Winckelmann, *Geschichte der Kunst des Alterthums*.)

DISRAELI, ISAAC, was born at Enfield in 1766. His father, Benjamin Disraeli, was the descendant of a family of Spanish Jews, who, driven from the Peninsula in the 15th century by the persecutions of the Inquisition, had settled in Venice, and there, to mark their race, had exchanged the Gothic-Spanish name they had hitherto borne for that of Disraeli—"a name never borne before or since by any other family" (the name was originally written D'Iraeli; but in his later years the subject of this memoir was in the habit of omitting the apostrophe). He had come over to England from Italy in 1748, and made a considerable fortune by commerce. He married in 1765 "the beautiful daughter of a family" of his own race "who had suffered much from persecution." She was a person of strong sense but no imagination, whose ruling feeling was "a dislike for her race." The only child of this union was the subject of our notice. His sensitive and poetical character as a boy puzzled both his parents, and, in particular, occasioned continual discord between him and his mother. His father destined him for commerce; but from the first he showed a decided aversion to an active life. Educated first at a school near Enfield, and then at Amsterdam, where the only advantage he received was that derived from access to a large library, he was not more than eighteen when, in spite of all that his father could say or do, he signified his intention of being a literary man. "He had written a poem of considerable length, which he wished to publish, against commerce." His father naturally opposed this intention, and accordingly "he enclosed his poem to Dr. Johnson with an impassioned statement of his case, complaining that he had never found a counsellor or literary friend. He left his packet himself at Bolt Court, where he was received by Mr. Francis Barber, the doctor's well known black servant, and told to call again in a week." When he did call the packet was returned to him unopened, with a message that the doctor was too ill to read anything. The doctor, in fact, was then on his death-bed. In 1788 Disraeli's father sent him to travel in France. On his return, finding Peter Pindar's satires in

everybody's mouth, he ventured anonymously to publish by way of corrective some verses "On the Abuse of Satire," which Walcott attributed to Hayley. About this time he became acquainted with Mr. Pye, afterwards poet laureate, who was of service to him in many ways, and who persuaded his father to allow him to follow his own inclinations. Accordingly from about 1790, without any farther opposition on the part of his family, and with sufficient means supplied by his father (who survived till 1819, when he was nearly ninety years of age), he was free to devote himself entirely to literature. His first efforts were in poetry and romance. His early verses are forgotten; but a volume of romantic tales, including one called 'The Loves of Mejnoun and Leila,' published by him some time before the close of the 18th century, reached a second edition. But, though he had much poetic taste, he was not fitted to be a poet or creative writer; and he was not long in finding out that his true destiny was "to give to his country a series of works illustrative of its literary and political history"—in other words, to prosecute researches in literary history and gossip. It was in the year 1790 that he published anonymously a little volume entitled 'Curiosities of Literature.' The success of this volume determined him to prosecute the walk which he had there entered upon. Accordingly, with the exception of the volume of romance above alluded to, and we believe, one other anonymous publication, all Mr. Disraeli's farther productions during his long life consisted of the fruits of his literary and historical researches. These researches were prosecuted partly in the British Museum, where he was a constant visitor at a time when the readers who had access to its treasures were not more than half-a-dozen daily; partly in his own library, which, especially in the end of his life (when he resided on his own manor of Bradenham in Buckinghamshire) was very extensive. The results of these researches were put forth from time to time either as additions to his 'Curiosities of Literature' (which thus eventually attained, in the eleventh edition published in 1839, the bulk of six volumes); or as independent publications. Among the independent publications may be mentioned his 'Essay on the Literary Character' originally published in 1795; his 'Calamities of Authors,' his 'Quarrels of Authors,' or 'Memoirs of Literary Controversy,' and his 'Inquiry into the Literary and Political Character of James the First'—works originally published between 1812 and 1822, and since then published collectively under the title of 'Miscellanies of Literature;' and his 'Life and Reign of Charles the First,' published in five volumes at intervals between 1828 and 1831. In acknowledgment of this last work he was made D.C.L. by the University of Oxford. He contemplated a 'Life of Pope,' and also 'A History of the English Free-thinkers,' and had collected materials for both; but a paralysis of the optic nerve which attacked him in 1839 prevented him from executing either. With the assistance of his daughter he selected from his manuscripts three volumes, which were published in 1841 under the title of 'Amenities of Literature.' His last years were spent in revising and re-editing his former works; and he died in 1848 at the age of eighty-two. "He was," says his son, from whose memoir, prefixed to a new and posthumous edition of his 'Curiosities of Literature,' we have derived the foregoing particulars, "a complete literary character, a man who really passed his life in his library. Even marriage produced no change in these habits: he rose to enter the chamber where he lived alone with his books, and at night his lamp was ever lit within the same walls." In his old age his appearance was mild and venerable; he had then become rather corpulent.

*DISRAELI, THE RIGHT HONOURABLE BENJAMIN, one of the sons of the subject of the preceding notice, was born in London in December 1805. He showed great precocity of talent; which however was for some time kept in check by drudgery in an attorney's office, where he had been placed by his father to qualify him for the legal profession. His first efforts with his pen were in 1826, when he contributed articles to a daily metropolitan newspaper then started in the Tory interest, under the name of 'The Representative.' The paper did not exist longer than five months. The experiment he had made in connection with it however was sufficient to confirm young Disraeli's determination to combine political ambition with what he might consider his hereditary right to distinction in literature. In 1828 he published his novel of 'Vivian Grey,' painting the career in modern society of a youth of talent, ambitious of a political celebrity. This work made a great sensation. From 1829 to 1831 Mr. Disraeli travelled on the Continent, and in the East, whence he brought home those impressions of Oriental life, the pictures of which appear in so many of his novels; and about the same time apparently he began those musings as to the function in the modern world of the race to which he belonged, which have since, under the form of a theory of the supremacy of the Semitic mind (Mr. Disraeli misnames it the *Caucasian* mind) pervaded most of his works. While on his travels Mr. Disraeli wrote and published two additional novels, 'Contarini Fleming' and 'The Young Duke.' On his return, at a time when the Reform Bill agitation had introduced a new era in British politics, he made various efforts to get elected to Parliament. He stood, with recommendations from Mr. Hume and Mr. O'Connell to back him, for the small borough of Wycombe in Bucks, his position being that of a candidate of Radical opinions, whom however the Tories as well as the Radicals supported, from opposition to the Whigs. Defeated in

this election he became a candidate (1833) in the Radical interest for the borough of Marylebone; describing himself in his address to the electors as a man who "had already fought the battle of the people," and who "was supported by neither of the aristocratic parties," and avowing himself a friend to Triennial Parliaments and Vote by Ballot. He was again unsuccessful; and seeing no chance of being elected by any other constituency, he resumed his literary occupations. The 'Wondrous Tale of Alroy,' and 'The Rise of Iskander,' published together in 1833 provoked some critical ridicule from the extravagance of their style, as well as from the extravagance of the author's claims in their behalf as novelties in the modern literary art. They were followed by the 'Revolutionary Epic,' a quarto poem (1834), the high pretensions of which were not confirmed by any impression it made on the reading public. In the same year he published a political pamphlet entitled, 'The Crisis Examined,' and in 1835 another pamphlet entitled, 'A Vindication of the English Constitution.' In this year he became a candidate for the borough of Taunton, and as he now came forward in the Conservative interest, O'Connell in reply to an attack made by Mr. Disraeli on him at the hustings, issued a diatribe against him, in which he accused him of inconsistency in language coarser and more personal than was perhaps ever used before on any similar occasion. This led to a hostile correspondence between Mr. Disraeli and Mr. O'Connell's son, and to altercations in the newspapers, in the course of which Mr. Disraeli explained his political principles in a manner intended to show how his professions and conduct in 1831 and 1833 might be reconciled with his professions and conduct in 1835. In a letter addressed to Mr. O'Connell himself, after his failure in the election, he said, alluding to this fact of his repeated failures:—"I have a deep conviction that the hour is at hand when I shall be more successful. I expect to be a representative of the people before the repeal of the union. We shall meet again at Philippi; and rest assured that, confident in a good cause, and in some energies which have not been altogether unimproved, I will seize the first opportunity of inflicting upon you a castigation which will at the same time make you remember and repent the insults that you have lavished upon Benjamin Disraeli." This was thought bravado at the time; but the prediction was realised. After an interval of two years—during which he published his novels 'Henrietta Temple' (1836) and 'Venetia' (1837)—Mr. Disraeli at the age of thirty-two was returned as Conservative member for Maidstone (1837). But the list of his failures was not yet closed. His maiden speech—prepared beforehand and in a very highflown style—was a total failure; he was accompanied through it by the laughter of the House, and at last was obliged to sit down. But before he did so, he energetically uttered the following sentences, "I have begun several times many things, and have often succeeded at last. *I shall sit down now, but the time will come when you will hear me.*" This proved to be true. Speaking little for some time, and carefully training himself to the parliamentary style and manner, he began about 1839 to obtain the attention of the House; and by the year 1841 he was recognised as the leader of the "Young England Party," who were trying to give a new form and application to Tory principles. His marriage in 1839 with Mrs. Wyndham Lewis, the wealthy widow of his parliamentary colleague for Maidstone, gave his talents the social means necessary for their full success in public life. It was during the Peel ministry of 1841-46 that he acquired his highest distinction as a master of parliamentary invective: during the latter portion of this period his attacks on Peel were incessant. He was then member no longer for Maidstone but for Shrewsbury (1841-47). After the repeal of the Corn Laws and the retirement of Sir Robert Peel from office, Mr. Disraeli laboured, in conjunction with Lord George Bentinck, to form the new Protectionist party as distinct from both the Peel-Conservatives and the Whigs. The results were decisive. After Lord George Bentinck's death in 1848, Mr. Disraeli (elected for Bucks in 1847) became the leader of the Protectionist or old Tory party in the House of Commons; and he led it with such consummate ability, that, on the retirement of Lord John Russell's cabinet in 1852, and the formation of a Tory government under Lord Derby, Mr. Disraeli became Chancellor of the Exchequer. This government however lasted only from March to December 1852, when it broke down on Mr. Disraeli's budget. The Coalition Ministry of Lord Aberdeen succeeded, to be followed by that of Lord Palmerston; and while we write (1856) Mr. Disraeli has never again been in office, but, like Lord Derby, has exercised his talents in parliamentary opposition to Whigs and Peelites. It is only necessary to add the list of his works published since the commencement of his parliamentary career in 1837. These are 'Alaricos: a Tragedy,' published in 1839; 'Coningsby: or the New Generation,' a political novel on Young England principles, published in 1844; 'Sybil, or the Two Nations,' a novel of similar purpose, published in 1845; 'Tancred, or the New Crusade,' also a political novel, published in 1847; and a 'Political Biography of Lord George Bentinck.' Of more trifling writings it is unnecessary to take note.

DISSEN, GEORGE LUDOLF, an eminent German scholar, was born on the 17th of December 1784, at Grossen-Schneen, near Göttingen, where his father was pastor. He lost both his parents at the age of thirteen, but a benevolent friend procured for him admission, free of expense, to the celebrated school at Pforta in Saxony, whither

the boy was sent in his fourteenth year, and there he laid an excellent foundation for his future philological studies. In 1804 he went to the university of Göttingen, where until the year 1808 he devoted himself to the study of philology and philosophy under Heyne and Herbart. His former friend continued to support him in the university; but he was obliged to increase his means by private tuition. The study of art and poetry, and of the beautiful in general, was his delight, and gave to his mind that tone and tendency which we can trace in all his literary productions. On his return to Göttingen he obtained the degree of Doctor in Philosophy, together with permission to deliver lectures in the university. On that occasion he published his first work, a dissertation—'De Temporibus et Modis Verbi Graeci,' Göttingen, 1809, 4to. The principal subjects with which he now occupied himself, and on which he lectured, were Greek Grammar and Greek philosophy, especially Plato, the study of whose writings brought about an intimate friendship between him and Boeckh, who then used to visit Göttingen very often. His natural tendency to assemble around him young men of talent and congenial pursuits, induced him, towards the end of 1811, to form a philological society at Göttingen, of which he was elected president. In 1812 he accepted the offer of an extraordinary professorship of Classical Philology in the University of Marburg. He entered upon his new office with an inaugural dissertation—'De Philosophia Morali in Xenophontis de Socrate Commentariis tradita,' Marburg, 1812. Philological studies were at that time rather neglected at Marburg, but Dissen gave a fresh impulse to them, although he did not remain there more than eighteen months; for in the autumn of 1813 he accepted an invitation as extraordinary professor of Classical Literature in the University of Göttingen, which was always his favourite place, and where in 1817 he was appointed ordinary professor. Incessant study and a secluded life had already impaired his health, but his activity as a lecturer was very great. His lecture-room was always filled, and he succeeded in inspiring his audience with an ardent love of the study of antiquity. The zeal with which he devoted himself to his professional duties and the cultivation of his own mind prevented his doing much as an author; and all that was published by him during the period from 1815 to 1825 consists of the part he took in Boeckh's great edition of Pindar, and some reviews which he wrote for the 'Göttinger Gelehrten Anzeigen.' In regard to ancient writers, and poets in particular, Dissen directed his attention more particularly to analysing the connection of the ideas, a point which had been much neglected by previous commentators. With a view to supply this want he prepared a new edition of Pindar, which appeared in 1830 in 2 vols. 8vo; and of which a second edition with some improvements was published by Schneidewin in 1843. In this work Dissen propounded his æsthetical views respecting the artistic construction of the Pindaric odes. The manner in which he has executed his task clearly shows that Dissen was not only no poet, but that he had little conception of the manner in which a poet sets to work. He displays great analytical powers, but they would have been more properly applied to the works of a philosopher than to those of a poet. His edition of Pindar is nevertheless one of the best that we have.

Dissen's illness was of an asthmatic nature, and about this time had become so much worse, that he was obliged to give up lecturing; but in proportion as his professional occupations decreased, his literary activity increased. Thus he produced in 1835 an edition of Tibullus, with valuable dissertations and a commentary, and in 1837 an edition of Demosthenes's oration 'De Corona.' The great object of these two publications is the same as that of his Pindar, to establish a mode of interpreting the ancients, which should not merely explain the language and subject-matter of a writer, but the artistic construction of his work, and should thus, as it were, trace the secret processes in the author's own mind. This mode of treating an ancient author may be very interesting and instructive, but it opens a wide field of speculation, and the results are seldom satisfactory. Immediately after the appearance of his 'Pindar,' Dissen was severely criticised, and among others by his friend Boeckh, which greatly irritated him. His edition of Tibullus is perhaps his best and most satisfactory production: it should not be used without Dissen's 'Supplementum editionis Albi Tibulli Heynii-Wunderlichiani,' which he published in 1819. His edition of the oration of Demosthenes contains many valuable remarks on the style and peculiarities of that orator: it was his last production, and appeared only a few days before his death, which took place about the middle of September, 1837.

Dissen was never married; but he supported with paternal care several young men of talent whose fathers had been his friends during their lifetime. He was a man of great sensibility, enthusiastic for everything great and noble, and capable of the most devoted friendship, though in his social intercourse he seldom conversed on any other topics than those relating to the study of antiquity, for his whole mental faculties were absorbed in his pursuits. Besides the works already mentioned, we must not leave unnoticed an excellent little treatise entitled 'Anleitung für Erzieher, die Odyssee mit Knaben zu lesen,' with a preface by the philosopher Herbart, Göttingen, 1809, 8vo. A number of smaller dissertations in Latin and German, together with a selection of the reviews written by Dissen, was published as a collection after his death by his friend K. O. Müller, under the title of 'Kleine Lateinische und Deutsche Schriften, von Ludolf Dissen,' Göttingen, 1839, 8vo. It is preceded by biographical notices written by

his friends Fr. Thiersch, F. G. Welcker, and K. O. Müller, from which the above notice is derived.

DITTON, HUMPHREY, an eminent divine and mathematician, was born at Salisbury May 29, 1675. He was an only son; and manifesting good abilities for learning, his father procured for him an excellent private education. It does not appear that he was ever at either of the universities, a circumstance owing probably to the religious principles of his parents. Contrary, it is understood, to his own inclination, but in conformity with his father's wishes, he chose the profession of theology; and he filled a dissenting pulpit for several years at Tunbridge with great credit and usefulness. His constitution being delicate, and the restraints of his father's authority being removed—he also having married at Tunbridge—he began to think of turning his talents into another channel. His mathematical attainments having gained for him the friendship of Mr. Whiston and Dr. Harris, they made him known to Sir Isaac Newton, by whom he was greatly esteemed, and by whose recommendation and influence he was elected mathematical master of Christ's Hospital. This office he held during the rest of his life, which however was but short, as he died in 1715, in the fortieth year of his age.

Ditton was highly esteemed amongst his friends; and great expectations were entertained that he would have proved one of the most eminent men of his time. He however attained a high degree of celebrity, and published several works and papers of considerable value, of which the following list contains the principal:—

1. 'On the Tangents of Curves,' &c., 'Phil. Trans.,' vol. xxiii. 2. 'A Treatise on Spherical Catoptrics,' in the 'Phil. Trans.' for 1705; from whence it was copied and reprinted in the 'Acta Eruditorum,' 1707.
3. 'General Laws of Nature and Motion,' 8vo, 1705. Wolfius mentions this work, and says that it illustrates and renders easy the writings of Galileo, Huygens, and the 'Principia' of Newton.
4. 'An Institution of Fluxions, containing the first Principles, Operations, and Applications of that admirable Method, as invented by Sir Isaac Newton,' 8vo, 1706.
5. In 1709 he published the 'Synopsis Algebraica' of John Alexander, with many additions and corrections.
6. His 'Treatise on Perspective' was published in 1712. In this work he explained the principles of that art mathematically; and besides teaching the methods then generally practised, gave the first hints of the new method, afterwards enlarged upon and improved by Dr. Brook Taylor, and which was published in the year 1715.
- In 1714 Mr. Ditton published several pieces, both theological and mathematical, particularly (7.) his 'Discourse on the Resurrection of Jesus Christ,' and (8.) the 'New Law of Fluids, or a Discourse concerning the Ascent of Liquids, in exact Geometrical Figures, between two nearly contiguous Surfaces.' To this was annexed a tract to demonstrate the impossibility of thinking or perception being the result of any combination of the parts of matter and motion: a subject which was much agitated about that time. To this work was also added an advertisement from him and Mr. Whiston concerning a method for discovering the longitude, which it seems they had published about half a year before. This attempt probably cost our author his life; for though it was approved and countenanced by Sir Isaac Newton before it was presented to the Board of Longitude, and the method has since been successfully put in practice in finding the longitude between Paris and Vienna, yet that board determined against it. The disappointment, together with some ridicule (particularly in some verses written by Dean Swift), so far affected his health, that he died in the ensuing year, 1715.

In the account of Mr. Ditton, prefixed to the German translation of his discourse on the Resurrection, it is said that he had published, in his own name only, another method for finding the longitude; but this Mr. Whiston denied. However, Raphael Levi, a learned Jew, who had studied under Leibnitz, informed the German editor that he well knew that Ditton and Leibnitz had made a delineation of a machine which he had invented for that purpose, that it was a piece of mechanism constructed with many wheels like a clock, and that Leibnitz highly approved of it for land use, but doubted whether it would answer on shipboard, on account of the motion of the ship.

DIXON, WILLIAM HEPWORTH, was born in 1821. In 1846 he came to London, and soon became known by his writings in periodical works. In the 'Daily News' he published a series of papers, 'On the Literature of the Lower Orders,' which attracted attention; and another series on 'London Prisons.' These papers, greatly enlarged, formed an interesting volume, published in 1850. His volume on 'London Prisons' had been preceded by 'John Howard and the Prison World of Europe.' In 1851 appeared 'William Penn, an Historical Biography.' Independently of the value of this life, it has attracted great attention with reference to what Mr. Dixon calls 'The Macaulay Charges.' Mr. Macaulay, in the first two volumes of his 'History of England,' made several strong statements regarding the character of Penn, which Mr. Dixon undertook to refute, especially with regard to the accusation of Penn having received a bribe for intervening to save the lives of some persons at Taunton, implicated in Monmouth's rebellion. To Mr. Dixon's statements Mr. Macaulay never replied; and upon the publication of his third and fourth volumes, continued to maintain his opinions of the conduct of the celebrated Quaker. Mr. Dixon again came forward, in a temperate but firm Preface to a new edition of his 'Biography.' In 1852 he published the 'Life of

Blake;' and he also wrote in that year a pamphlet to repel the fear of an invasion from France. Towards the end of 1853 he was appointed editor of the 'Athenaeum.' Mr. Dixon's biographical works display a great amount of original research; and the results of many careful investigations of original documents are presented in an agreeable form.

DMITRIEV, IVAN IVANOVITCH, was born in 1760, in the government of Simbirsk, where his father, who was himself a man of superior information, possessed an estate. After being educated at Kazan until his twelfth year, he was pursuing his studies at Simbirsk, when that part of the empire was thrown into an unsettled state by Pugatchev's rebellion, in consequence of which his family determined to leave it, and he was sent to St. Petersburg, where he was entered in the Semenovsky regiment of guards, and within a short time put on active service, in which he continued until the reign of the emperor Paul, when an appointment in the civil service was bestowed upon him. After the accession of Alexander he was made successively minister of justice and privy councillor, and finally retired from public life with a pension and the order of St. Vladimir of the first class. Although a life passed in such occupations was little favourable to literary pursuits, particularly the earlier part of it, a strong natural attachment to them led him to devote himself to them as sedulously as circumstances would permit, and with such success, that, after Karamzin, he was, among contemporary writers, the one who most contributed to polish the Russian language, imparting to it more ease and gracefulness of style and elegance of diction. His poems, which have passed through many editions, and are deservedly popular, consist principally of odes, epistles, satires, tales, and fables, in which last-mentioned species of composition—a very favourite one with his countrymen—he particularly excelled; and if we except Krilov, he occupies the first rank among the Russian fabulists. By some he has been styled the Lafontaine of Russia, as well on account of the refined tone of his subjects as the studied simplicity of his language. In his poetical tales he is unrivalled among his countrymen, not less for the playfulness and shrewdness of his satire than for the peculiar happiness and finish of his style. His odes likewise possess considerable merit; but as a lyric poet he falls short of Lomonosov, Derzhavin, and Petrov.

DOBREE, PETER PAUL, was born in the island of Guernsey in the year 1782. At an early age he was sent to Dr. Valpy's school at Reading, and stayed there till he became an undergraduate of Trinity College, Cambridge, in 1800; and took his B.A. degree in 1804. Having been elected a fellow of his college, he continued to reside at Cambridge, devoting himself to classical studies, and enjoying the intimacy of Porson, to whom he was devotedly attached, and from whom he derived all the spirit of his scholarship. After Porson's death, the books and manuscripts of that great critic were purchased by Trinity College, and the task of editing part of Porson's notes was intrusted to Dobree: he was prevented however by illness, a subsequent journey to Spain, and other causes, from publishing the portion of these remains assigned to him till 1820, when he brought out an edition of the Plutus and of all that Porson had left upon Aristophanes, along with some learned notes of his own. In 1822 he published Porson's transcript of the lexicon of Photius. In the following year he was elected Regius professor of Greek. He died on the 24th of September 1825. He was engaged on an edition of Demosthenes at the time of his death: his notes on this and other Greek and Latin authors were collected and published by his successor in 1831. Some of his remarks are very acute, and some of his conjectures most ingenious; but the greater part of his observations were certainly never intended for the press. As a scholar, Dobree was accurate and fastidious; he had some taste and much common sense, which preserved him from committing blunders. His unwearying industry supplied him with a vast induction of particular observations, but he was unwilling, perhaps unable, to generalise; and on the whole it must be allowed that he has neither done nor shown a power of doing anything to justify the extravagant encomiums of some of his friends.

DÖBRENTÉI, GABOR or GABRIEL, an Hungarian author and antiquary of distinguished merit, was born at Nagy-Szöllös, in the county of Vasprim in 1786. He showed very early not only a remarkable zeal for the Hungarian language and literature, but a singular social talent for enlivening others in his views. At Oedenburg, a town not far within the frontier from Austria, and chiefly inhabited by Germans, he succeeded in getting up an Hungarian literary society, of which he became the secretary; and under his superintendence, when a youth of nineteen, a volume of 'Transactions' was published. At twenty he studied at Wittenberg and Leipzig, and in 1807 was recommended by Kasziny, then the almost acknowledged head of Hungarian literature, to the post of tutor to Count Louis Gyulay, a nobleman of Transylvania, which made him for some years a resident in that country. With the literary contributions of some of his Hungarian and Transylvanian friends, and the pecuniary contributions of the Transylvanian magnates, he set on foot and edited a magazine, the 'Erdélyi Múzeum,' of which the first number was issued at Klausenburg and the remaining nine at Pesth, after which it ceased for want of support; but it contained so many articles of interest that no Hungarian library is considered complete without it. In 1820 Döbrentéi removed to Pesth, where he continued to reside for the

remainder of his life, in the occupation of several highly-respectable official posts of a legal character, and in such constant literary activity that he became the acquaintance or friend of almost every person of any note connected with Hungarian literature. Indeed almost all the information that has been put in circulation on that subject in England had its origin in Döbrentei. He was the friend and correspondent of Dr. now Sir John Bowring, to whom he supplied much of the information for his 'Poetry of the Magyars;' he also communicated to Miss Pardoe materials for her account of Hungarian literature and authors in her 'City of the Magyar,' and he wrote the article on the subject in the Leipzig 'Conversations-Lexikon,' which, by its being translated in Lieber's 'Encyclopædia Americana,' and the translation reprinted in the Glasgow 'Popular Encyclopædia,' has become familiar to thousands of English readers. As a poetical writer, Döbrentei was not successful; his original poems appear to have been pleasing, and no more; and though his translation of Shakspeare's 'Macbeth' was acted at Presburg in 1825, it did not receive such a welcome as to encourage the publication of his versions of the other masterpieces of Shakspeare, which were reserved in Hungarian for the more successful pen of a lady, Emilia Lemouton, who is, we believe, the only translator of our great poet in any language. Döbrentei was more at home in his exertions to establish a 'Casino' at Pesth, an establishment of nearly the same kind as an English club of our own days, but borrowed both in plan and name from Italy, where it is made use of not to render more exclusive the society of the capital, but to enliven the dullness of the provincial towns. He was, after Count Stephen Szechenyi, the most influential person in promoting this institution, and was for some years its secretary, but relinquished the post to take that of one of the secretaries of the Hungarian Academy in 1831, of which he was also a zealous promoter. Kohl, the traveller, bears testimony to the extraordinary influence of these establishments on the whole tone of society even in Hungarian villages, where they were imitated on a small scale. In 1837 Döbrentei received an intimation from the government that his holding the post of secretary to the Academy any longer would be incompatible with his official duties, and he then devoted himself to the editorship of his great work, the 'Régi Magyar Nyelvemlékek,' or 'Ancient Monuments of the Magyar Language,' the first volume of which, a substantial quarto, was published at Buda in 1825, and the fifth was in preparation at the time of Döbrentei's death. His labours on this work were the delight of his life, he pursued them with irrepressible ardour, and on the result his reputation rests securely. When he began hardly anything was known of the history of the Magyar language for centuries, and a subject that he found in darkness he left environed with light. He was indefatigable in discovering the existence of old correspondence or documents in family archives; when he had once discovered them, he was no less eager in obtaining permission to copy and make use of them, and he was not a man to take easily a refusal. By this combination of qualities he amassed a quantity of materials which nobody before him had ever supposed to exist, and he made such good use of them that the works of subsequent authors are full of constant references to Döbrentei's 'Nyelvemlékek,' which has become one of the principal monuments of Hungarian literature. How the revolution of 1848 affected him we have not seen stated, but it is well known that his friend and fellow-promoter of progress, Count Stephen Szechenyi, became a maniac. Döbrentei was still engaged in collecting materials for his great work when surprised by death on the 27th of March 1851, at the age of 65. He was the author of numerous lives of Hungarian worthies both in the periodicals to which he contributed and in the 'Esmertetch Tára,' or Hungarian translation of the Leipzig 'Conversations-Lexikon,' with original additions to the Hungarian articles, and in editions of Berzsenyi and other authors published under his superintendence, but no extended account of himself appears to have been published since his death.

DOBRIZHOFER, MARTIN, Jesuit missionary to the South American Indians, was born at Grätz, in Styria, in 1717. He was admitted into the Society of Jesus in 1736, and having undergone the regular course of training and probation, was sent in 1749 to the society's mission in Paraguay. Dobrizhoffer dwelt among the Abipones and Guarinis for eighteen years, when, on the expulsion of the Jesuit missionaries from Spanish South America, in 1767, he was compelled to return to Europe. He took up his residence at Vienna, where he became much noticed, on account of his descriptions of the people among whom he had laboured. The empress Maria-Theresa is said to have been a frequent auditor to his animated narratives. At length he was induced to write an account of the more remarkable of the two races. In 1784 this account was published at Vienna, under the title of 'Historia de Abiponibus, equestri bellicosaque Paraguaris Natione, locupletata copiosis barbarum gentium, urbium, hominum, ferarum, amphibiorum, insectorum, serpentium præcipuorum, piscium, avium, arborum, plantarum, aliarumque ejusdem provincie proprietatum observationibus,' 8 vols. 8vo. Dobrizhoffer's account of the Abipones is very ample, and minute even to tediousness; and though it contains many curious and interesting facts about a people long since (1770) migrated from their own country [ABIPONES, in ENG. Cyc., QUOS. DIV.], it is impossible to read it without considerable scepticism. Dobrizhoffer was in fact an old man when he wrote his history, and some sixteen years had passed away since he was compelled to

leave the country; and, like Bruce, his imagination had come to play falsely with his memory. Thus when, in illustration of the longevity of this wonderful race, he says that an Abiponian who dies at eighty is thought to have come to an untimely end, and that in ordinary cases a man of a hundred has his sight and hearing unimpaired, and can leap on his horse as nimbly as a boy, and without fatigue sit there for hours, we are constrained to hesitate about accepting the statement without some grains of allowance. Dobrizhoffer's book was a favourite with Southey, and at his suggestion Sara Coleridge translated it into English: 'An Account of the Abipones, an Equestrian people of Paraguay,' 3 vols. 8vo, 1822. It has also been translated into German.

DOBROWSKY, JOSEPH, known as the patriarch of modern Bohemian literature, was the son of a Bohemian sergeant in an Austrian regiment of dragoons, and was born on the 17th of August 1758 at Gyarmat near Raab in Hungary, where the regiment was in quarters. His father's name was Daubrawsky, but the regimental chaplain, who was ignorant of Bohemian spelling, entered the child in the baptismal register as Dobrowsky, and this was ever afterwards recognised as his name. The boy did not learn the Bohemian language till he was ten years old, when he was sent to Deutschbrot for his education, and in after-life it was long before he took any particular interest in the subject. His taste for study made him adopt an ecclesiastical life, and he entered the order of Jesuits in October 1772, only ten months before its dissolution, after which he prosecuted his studies at the university of Prague, and acquired some reputation for his knowledge of the oriental languages. He then became a tutor in the family of the Count von Nostitz, one of the great families of Bohemia, where he found as fellow-tutor Durich, the historian of Slavonic literature, and Pelzel, a noted miscellaneous writer, who was then engaged in compiling his 'Biographies of Bohemian and Moravian Authors and Artists,' in German and Latin, the book which, with Balbinus's 'Bohemia Docta,' has been the source of most that is in circulation on the Bohemian worthies. Pelzel requested Dobrowsky to assist him in collecting particulars for some of his biographies, and Dobrowsky, who had a most tenacious memory, became by this means so versed in a short time in the minutiae of the subject, that he warmed more and more into interest for it, and it finally became the business of his life. (It may be remarked that Dobrowsky subsequently wrote the lives of both Durich and Pelzel, but that, though as a member of the Bohemian Society he was bound to furnish the society with some account of his own, he always deferred doing so for more than forty years, and finally the careful biographer died without leaving any particulars of his own biography. His first separate publication was in 1778, when he issued an edition of the fragment of St. Mark's Gospel preserved at Prague, and believed to be in the handwriting of the apostle, but which he so forcibly demonstrated to be spurious, that the papal nuncio of Vienna openly expressed his opinion that he had settled the question. Such an outcry however was raised against him by the inferior clergy in Bohemia, that he found it advisable to print a pamphlet which had been written against his views at his own expense, and to circulate his answer to it only in manuscript. He next commenced a periodical review of Bohemian and Moravian literature, but this was soon stopped by the censorship for some incautious expressions in one of his prefaces complained of by some ecclesiastical authority, and which he refused to retract. It was evident to his friends that with his ardent and somewhat refractory temperament he would make no way in the church, and after the death of the emperor Joseph in 1790, he quietly withdrew into a learned retirement, subsisting on a pension which was paid him by the Austrian government as a compensation for a suppressed post he had held in the time of Joseph, and on another granted him by the Nostitz family. He made in 1792 an expedition to Denmark, Sweden, and Russia, at the expense of the Royal Bohemian Scientific Society, to inquire into the fate of the books and manuscripts, which at the time of the capture of Prague by the Swedes in the Thirty Years War, had been carried off from the Bohemian libraries. He also made at different times excursions through every part of Bohemia and Moravia, but with this exception his life was chiefly passed in quiet at the country-seat of one of the Nostitzes. For this there was unfortunately a strong reason. In 1795 he was for some time out of his senses; in 1801 he was obliged to be confined in a lunatic asylum, and though he soon recovered from this violent attack, yet ever after, on an average twice a year, he became occasionally disordered in mind. His physicians considered that this was owing to over-study, Dobrowsky stoutly maintained that study never did harm to any man, but attributed his illness to a shot which had entered his breast in 1782 at a hunting party, and remained unextracted to his death. The longest interval of freedom from his disorder which he enjoyed was once for eighteen months, when he was writing the 'Institutiones linguæ Slavicæ dialecti veteris,' on which his mind was fully occupied. Meanwhile his fame was constantly spreading, he was elected a member of all the distinguished academies of the east of Europe, and spoken of very highly by Göthe. For about twenty years, from 1809 to 1829, he was generally recognised as the highest authority on questions connected with the history of the Bohemian language and literature, then every year coming more and more into notice. This position was not always a pleasant one;

it led to his involvement in a controversy respecting an ancient manuscript, the discussions on which are said to have embittered his life for some years. This controversy is in many points one of the most singular and interesting in the whole history of literature.

In 1818, shortly after the foundation of the Bohemian Museum at Prague, its conductors received an anonymous letter, evidently written in a feigned hand, inclosing a Bohemian manuscript, which the writer of the letter stated that he had purloined from his master, whose name was of course not given, because he knew that he would rather burn it than present it to the museum. The manuscript contained a poem, since well known under the name of 'The Judgment of Libussa,' which those who maintain its genuineness regard as the most ancient monument of the Bohemian language, and older than the 10th century. Dobrowsky suspected its authenticity from the first, and immediately on seeing it pronounced it without hesitation to be a forgery, the production of some Bohemian Chatterton, adding, to his friends, that he had no doubt it was from the hands of Wacław Hanka. Hanka was a young antiquary, who had recently made a tour for the purpose of collecting poetical manuscripts, and had been fortunate enough to find at Kralodvz a collection of ancient poetry which has been since universally recognised as the finest relic of ancient Bohemian literature, if it be really ancient, which was at first not generally believed.

The accused protested his innocence; but the judgment of Dobrowsky in such matters was regarded as almost infallible, and it was thought best by Bohemian patriots to let the matter fall quietly into oblivion. In 1820 however Rakowiecki printed the fragment of 'Libussa's Judgment' in his 'Prawda Ruaha,' at Warsaw, as authentic; in 1821 Admiral Shishkov reproduced it in the 'Accounts' of the Russian Academy at St. Petersburg; and an opinion now began to gain ground in Bohemia that authentic or not it was a piece of great value. Dobrowsky, indignant at the revival of the affair, published, in Hormayr's 'Archiv,' a Vienna periodical, an article upon it, headed 'Literary Fraud,' and concluding with the words that "it was the obvious imposture of a scoundrel who wished to play his tricks on his credulous countrymen." In 1828 however Hanka, then (and now) librarian of the museum, made a third discovery. He stated that he had purchased from a second-hand bookseller at Prague a volume bound in parchment, and on removing and examining the cover—unfortunately without informing any one else of his proceedings—had found it was a portion of a manuscript of St. John's Gospel, in Latin, with an interlinear Bohemian translation, supposed to be of a date anterior to the tenth century. Dobrowsky examined this manuscript, and pronounced in favour of its genuineness. He was then placed on the horns of a cruel dilemma: the manuscript of the St. John had many of the peculiarities which had been thought a proof against the 'Libussa.' Dobrowsky was so thoroughly perplexed that when a professor of chemistry proposed to apply some chemical tests to the ink of the 'Libussa' manuscript—but said that of course in doing so a part of it would be destroyed—Dobrowsky opposed the proposal, because, as he said, "the manuscript might be genuine after all." An elaborate examination of the subject by Safarik and Palacky ('Aeltesten Denkmäler der Böhmischen Sprache,' Prague, 1840) left them convinced that the manuscript was what it professed to be, and Hanka enjoys the reputation, not of an excellent poet, but of a very fortunate antiquary. The whole of his poetical discoveries were translated into English by Wratislav as undoubtedly genuine, and published at Cambridge in 1852. Dobrowsky, who was much annoyed at the turn the affair had taken, died on a journey at Brunn in Moravia, on the 6th of January, 1829, the year after the production of the manuscript of St. John.

The works of Dobrowsky are numerous: a complete list of them is given in Palacky's 'Joseph Dobrowsky's Leben und gelehrtes Wirken,' Prague, 1833. It is singular that nearly all of them are in the German language, it being in fact the opinion of Dobrowsky that the Bohemian language should only be made use of in works intended for the people. The modern Bohemian writers have, on the contrary, lately made it a point to write in their native language even their works of erudition. His essays 'On the Introduction of Printing into Bohemia,' 'On the earliest Bohemian Translation of the Bible,' 'On the History of the Bohemian Adamites,' &c., first appeared in the German 'Transactions of the Bohemian Scientific Society,' a most valuable series of volumes, and almost all of his compositions in his native language in the 'Casopis Českého Muzeuma,' a Bohemian periodical. His more important productions are a 'German and Bohemian Dictionary,' a 'Grammar of the Bohemian Language,' a 'History of the Bohemian Language and Elder Literature,' and, above all, the 'Institutiones Linguae Slavicae Dialecti Veteris,' Vienna, 1822, a book by which he threw a flood of light on a subject before involved in obscurity. The language treated of is that still used by the Russians in their church-service, and the book has been recognized by the Russians as of the highest value.

DOBSON, WILLIAM, was born in the parish of St. Andrews, Holborn, in 1610. He was a very distinguished painter, and succeeded Vandyck in the favour of Charles I., who used to call him the English Tintoret. His father was of a good family of St. Albans, but being at length in poor circumstances, his son was apprenticed to Mr. Peake, afterwards Sir Robert Peake, painter and picture-dealer,

who kept a shop at Holborn Bridge; but he learnt more, according to R. Symonds, of Francis Cleyn, a German, who stood also in great favour with Charles I.

Sir Robert Peake set Dobson to copy pictures for him, and exposed the copies for sale in his shop-window. One of these copies was seen by Vandyck in a shop-window on Snow Hill, and having made inquiries for the artist, he found him at work in a poor garret, whence he took him and introduced him to the king. After the death of Vandyck, Charles I. appointed Dobson sergeant-painter and groom of the privy-chamber, and he accompanied the king to Oxford, where he painted the king, Prince Rupert, and many of the nobility. The Rebellion however and his own extravagance got Dobson into difficulties, and he was thrown into prison for debt, from which he was released by a Mr. Vaughan, whose portrait he painted, and he considered it his best work in that class. He did not long enjoy his liberty: he died in London in 1646, aged only thirty-six, and was buried at St. Martin's-in-the-Fields.

Dobson painted both portrait and history; and his portraits are generally considered so excellent, that he has been termed the English Vandyck: his reputation was certainly unrivalled by that of any English portrait painter until the appearance of Sir Joshua Reynolds. There are several excellent historical pictures by Dobson in various parts of England. There is a 'Beheading of John the Baptist' at Wilton, in which the head of John is from Prince Rupert; at Blenheim is Francis Carter, an architect and pupil of Inigo Jones, with his family, a picture, says Walpole, equal to anything he had ever seen by Dobson. Walpole mentions several other family pieces, and many portraits with one or more figures, of which he particularly praises one at Drayton, in Northamptonshire, of Henry Mordaunt, earl of Peterborough, in armour, with a page holding his horse and an angel giving him his helmet. Walpole says further, "Dobson's wife, by him, is on the stairs of the Ashmolean Museum at Oxford; and his own head is at Earl Paulet's: the hands were added long since by Gibson, as he himself told Vertue." He also etched his own portrait. Dr. Waagen mentions a few pictures by Dobson which are not noticed by Walpole, all of which he uniformly praises, except in the colouring, which he considers inferior. Considering Dobson's short life and the very unsettled period in which he lived, a great proportion of his works have evidently been preserved, and it is to be regretted that there is not a single specimen of "the English Vandyck" in the British National Gallery. Dobson is said by Dargenville to have been the first artist to adopt the system of requiring half the payment of a portrait at the commencement of it: he did it to reduce the number of his sitters to within a practicable limit.

(Walpole, *Anecdotes of Painting, &c.*; Waagen, *Treasures of Art in England*; D'Argenville, *Abrégé de la Vie des plus fameux Peintres*.)

DODD, THE REV. WILLIAM, LL.D., was born in 1729, at Bourn, in Lincolnshire, of which place his father was vicar. In 1745, he was admitted a sizar of Clare Hall, Cambridge, and took his Bachelor's degree with reputation in 1750. Soon afterwards he removed to London, where he contracted an imprudent marriage. In 1753 he received priest's orders from the Bishop of London; and from this time he continued to obtain a succession of small preferments in the church, holding, in the latter part of his life, two chapels in London with a rectory and vicarage in the country, and possessing an ecclesiastical income of 800*l.* a year. His character as a popular preacher, and as a man of letters, aided by his assiduous courtship of persons of rank, procured for him patronage of a high order. He was one of the king's chaplains till he was displaced for a simoniacal offer; and in 1763 he was intrusted with the education of Philip Stanhope, afterwards the famous Earl of Chesterfield. During all this time his literary activity was great and varied. In February 1777 he was arrested on a charge of having forged the signature of his late pupil, Lord Chesterfield, to a bond for 4000*l.*, of which he had obtained payment. He repaid the money, but was brought to trial and convicted. He was executed on the 27th of July 1777. The writings of this unfortunate person are numerous, and in their matter exceedingly various. There are poems, among which are 'A New Book of the Dunciad,' published anonymously in 1760; and the blank verse poem, called 'Thoughts in Prison,' which was composed in the interval between his conviction and execution. Among the prose works are many sermons, and the well-known 'Reflections on Death,' 1763. A work of another character is his 'Beauties of Shakspeare,' in which, besides the extracts which make up the body of the volume, are interspersed many criticisms. These, like Dodd's other works, are fluent and tasteful rather than original or vigorous. Indeed some of them are mere plagiarisms. It is worth while to observe, that just before his apprehension he had entered on negotiations for publishing an expensive edition of Shakspeare's works; and that the desire of raising money for the engraving of the plates has been assigned as most probably his reason for committing the forgery. It is further stated in Cooke's 'Memoirs of Foote,' i. 195, that during his confinement in Newgate, Dodd completed a comedy he had begun some time before, entitled 'Sir Roger de Coverley;' and that after his condemnation he sent for Woodfall the printer to consult with him respecting its publication: but the comedy if finished was never acted or printed, and we are disposed, although the story has often been repeated and

never, as far as we are aware, contradicted, to doubt its correctness. Foote is a very unsafe authority for such a statement.

DODDRIDGE, PHILIP, D.D., was born in 1702, of an old dissenting family living in London, where he had the early part of his education. He was then for a time at St. Albans; and it having been early perceived that his turn of mind peculiarly pointed to the profession of a minister, he was entered about 1718 at a dissenting theological academy at Kibworth in Leicestershire, over which Mr. John Jennings presided. In 1722 he commenced his ministry at Kibworth, his late tutor Mr. Jennings removing in that year to Hincley, where he died in the succeeding year. The death of Mr. Jennings was an important event in the history of Doddridge. Great expectations had been formed among the Dissenters of the success of Mr. Jennings in the education of ministers, and it was thought a point of importance to maintain an academy of that kind in one of the central counties. Mr. Jennings had mentioned his pupil Doddridge as being a person eminently qualified to carry on the work, and the eyes of the Dissenters were generally directed to him as the person best qualified to do so. However, several years passed, during which Doddridge was leading the life of a non-conformist minister, his services being divided between the chapel at Kibworth, and one at the neighbouring town of Market Harborough. He was diligent in his ministry both in public and private, but he found time also for much theological reading, by which means he qualified himself the better for the office which he and his friends had in view.

In 1729 he began his academy, which soon attained a high reputation. It was the institution in which most of the more distinguished ministers of the Old or orthodox Dissenters in the middle of the 18th century were educated. It was first established at Market Harborough, where he at the time resided; but before the end of the year he removed to Northampton, having been invited to become the minister of the Dissenting congregation in that town; and at Northampton he continued both as pastor of the Dissenting congregation, and head of the Dissenting academy, till his death. Having gone to Lisbon on account of ill health, he died there thirteen days after his arrival, October 26, 1751.

Doddridge lived at a time when the zeal of the class of persons to whom he belonged had lost some part of its former fervour. This he saw with regret, and was very desirous to revive it. This appears to have been a principal object, and one kept steadily in view both in his ministerial labours and his published writings. His printed sermons are remarkable for the earnestness with which he presses the great importance of a religious life, the evil of spiritual indifference or carelessness, and the indispensable necessity of uniting with the practice of the moral duties the cultivation of the spirit of piety, and a deep and serious regard to the momentous truths of religion. This appears particularly in a book of his which has been very popular both at home and abroad, entitled 'The Rise and Progress of Religion in the Soul,' and it is also very apparent in the practical part of another very excellent publication of his entitled 'The Family Expositor,' in which is given the whole of the New Testament (the gospels being in a harmony), with a paraphrase, a series of critical notes, and reflections, or, as he calls them, improvements of each section into which the whole is divided. This work has also been often printed, and it marks the extent of his learning, as well as the depth of his piety; the notes abound with critical remarks, gathered out of numerous authors, or suggestions of his own mind, full of that knowledge which fits a man to illustrate those difficult writings. The course of metaphysical, ethical, and theological lectures, through which he conducted the young men who were trained by him for the Christian ministry, was published after his death in 2 vols. 8vo, and supplied for the time an excellent text-book of systematic divinity, as well as a very useful body of references to writers on metaphysics, ethics, and divinity. To Doddridge also the Dissenters owe some of the best hymns which are sung by them in their public services.

Two accounts of his life by contemporaries have been published: the first by Job Orton, another divine of a kindred spirit, who belonged to the same community; the second by the Rev. Dr. Kippis, a pupil of Dr. Doddridge, who has introduced it in the 'Biographia Britannica,' of which he was the editor. More recently his 'Correspondence' has been published by one of his descendants.

DODSLEY, ROBERT, was born in 1709, as is supposed, near Mansfield, in Nottinghamshire, where his father is said to have kept the Free school. Robert and several brothers however appear to have all commenced life as working artisans or servants. Robert is said to have been put apprentice to a stocking-weaver, from whom, finding himself in danger of being starved, he ran away, and took the place of a footman. After living in that capacity with one or two persons, he entered the service of the Honourable Mrs. Lowther, and while with that lady he published by subscription in 1732 an octavo volume of poetical pieces, under the title of 'The Muse in Livery, or the Footman's Miscellany.' The situation of the author naturally drew considerable attention to this work at the moment of its appearance; but the poetry was of no remarkable merit. His next production was a dramatic piece, called 'The Toyshop;' he sent it in manuscript to Pope, by whom it was much relished, and who recommended it to Rich, the manager of Covent Garden Theatre, where it was acted in 1735 with great success. With the profits of his play, Dodsley the

same year set up as a bookseller; and, under the patronage which Pope's friendship and his own reputation and talents procured him, his shop in Pall Mall soon became a distinguished resort of the literary loungers about town. His business, which he conducted with great spirit and ability, prospered accordingly; and in his latter days he might be considered as standing at the head of the bookselling trade. He continued also throughout his life to keep himself before the public in his first profession of an author, and produced a considerable number of works of varying degrees of merit, both in prose and verse. In 1737 his farce of 'The King and the Miller of Mansfield' was acted at Drury Lane with great applause. It was followed the same year by a sequel, under the title of 'Sir John Cockle at Court,' which however was not so successful. Nor was he more fortunate with his ballad farce of 'The Blind Beggar of Bethnal Green,' which was brought out at Drury Lane in 1741. This year also he set up a weekly magazine, under the title of 'The Public Register,' to which he was himself a principal contributor; but it was discontinued after the publication of the 24th number. It is curious to note that, in his farewell address to his readers, he complains that certain rival magazine publishers (understood to mean the proprietors of the 'Gentleman's Magazine') had exerted their influence with success to prevent the newspapers from advertising his work. In 1745 he published another short dramatic piece, entitled 'Rex et Pontifex,' being an attempt to introduce upon the stage a new species of pantomime; but this was never acted. A collected edition of all these dramas was published in 1748, in a volume, to which he gave the title of 'Trifles.'

The following year he produced a masque on the subject of the peace of Aix-la-Chapelle, under the title of 'The Triumphs of Peace,' which was set to music by Dr. Arne, and performed at Drury Lane. In 1750 appeared anonymously the first part of the ingenious and well-known little work, 'The Economy of Human Life,' which was long attributed to Lord Chesterfield, and was from the first extremely popular. It was, after Dodsley's death, ascribed to him by the 'Monthly Review,' and has ever since been confidently stated to be his writing: as far as we know however its authorship is by no means ascertained. The first part, entitled 'Agriculture,' of a poem in blank verse, on the subject of public virtue, which Dodsley published in 1754, was so coldly received that the second and third parts which he originally contemplated were never produced. In 1758 he closed his career of dramatic authorship with a tragedy entitled 'Cleone,' which was acted at Covent Garden with extraordinary applause, and drew crowded audiences during a long run. When it was published, 2000 copies were sold the first day, and it reached a fourth edition within the year. 'Cleone' however is now pretty well forgotten. Dodsley died at Durham, while on a visit to a friend, on the 25th of September 1764. He had retired from business some years before, having made a good fortune. Besides his 'Select Collection of Old Plays,' 12 vols. 8vo, 1780, in connection with which his name is now most frequently mentioned, and his 'Collection of Poems by Several Hands,' 4 vols. 12mo, 1748, in which many since famous short poems appeared for the first time, Dodsley's name is associated with several works of which he was only the projector and the publisher, but from his connection with which he is now more generally remembered than for his own productions. Among them may be mentioned the two periodical works, 'The Museum,' begun in 1746 and extended to three volumes, in which there are many able essays by Horace Walpole, the two Wartons, Akenside, &c. (of this Dodsley was only one of the shareholders), and 'The World,' 1754-57, conducted by Edward Moore, and contributed to by Lords Lyttleton, Chesterfield, Bath, and Cork, Horace Walpole, Soame Jenyns, &c.; 'The Preceptor,' 2 vols., 1748, to which Johnson wrote a preface; and especially the 'Annual Register,' begun in 1758, and still carried on. These, and the other works in which he was engaged, brought him into intimate connection with most of the eminent men belonging to the world of letters during the period of his able and honourable career. He has also the credit of having first encouraged the talents of Dr. Johnson, and by purchasing his poem of 'London' in 1738 for the sum of 10 guineas, and of having many years afterwards been the projector of the 'English Dictionary.' A second volume of Dodsley's collected works, forming a continuation of the 'Trifles,' was published under the title of 'Miscellanies,' in 1772. (Besides the articles in the second edition of the 'Biographia Britannica,' in Chalmers, and in the 'Biographia Dramatica,' there are many notices respecting Dodsley in Nichols's 'Literary Anecdotes of the Eighteenth Century'.)

DODSWORTH, ROGER, an eminent antiquary, was the son of Matthew Dodsworth, registrar of York Cathedral, and chancellor to Archbishop Matthew. He was born on July 24th, 1585, at Newton Grange in the parish of St. Oswald, in Rydale, Yorkshire. He died in the month of August, 1654, and was buried at Rufford in Lancashire. His manuscript collections, partly relating to Yorkshire, in 162 volumes folio and quarto, 122 of them in his own handwriting, were bequeathed to the Bodleian Library at Oxford in 1671, by General Fairfax, who had been Dodsworth's patron. Chalmers says that Fairfax allowed Dodsworth a yearly salary to preserve the inscriptions in churches.

Dodsworth was the projector, and collected many of the materials for the early part, of the work now known as 'Dugdale's Monasticon,'

in the title-page of the first volume of which his name appears as one of the compilers.

There is a detailed catalogue of the contents of Dodsworth's collections, now in the Bodleian Library, in the great catalogue of the Manuscripts of England and Ireland, folio, Oxon., 1697.

(Gough, *Brit. Top.* vol. i., pp. 123-24; Chalmers, *Biog. Dict.*, vol. xii., p. 160; and the Preface to the last edition of the *Monasticon*.)

DODWELL, EDWARD, F.S.A., was a man of fortune, and was educated at Trinity College, Cambridge. He left the university in 1800, and from that time till his death in May 1832, he mostly resided abroad, and occupied himself in researches connected with the earlier antiquities of Greece and her colonies. The first results of his investigations and studies in this field he gave to the world in 1810, in two quarto volumes entitled 'A Classical and Topographical Tour through Greece during the years 1801, 1805, and 1806.' This learned and accurate work was followed in 1821 by a folio volume of 'Views in Greece, from Drawings by Edward Dodwell, Esq.,' containing thirty coloured prints, accompanied by short descriptions in French and English, from a collection of nearly a thousand drawings which he had made of architectural objects and natural scenery. In the summer of 1830 Mr. Dodwell brought on a severe illness by fatigue and long exposure to the sun while engaged in seeking for the situation of some ancient cities in the Sabine Mountains; and from this he never completely recovered. He left on his death a very large collection of drawings, from which a folio volume of lithographic plates was published at London in 1834, under the title of 'Views and Descriptions of Cyclopiæ or Pelasgic Remains in Greece and Italy; with Constructions of a later Period, from Drawings by the late Edward Dodwell, Esq., F.S.A., &c., intended as a Supplement to his Classical and Topographical Tour in Greece, &c.' Of the views seventy-one are Grecian, fifty-five Italian. The descriptions by which the plates are accompanied are very brief.

DODWELL, HENRY, was born in Dublin in 1642. His father, who had been in the army, possessed some property in Ireland, but having lost it in the rebellion, he brought over his family to England, and settled at York, in 1648. Young Dodwell was sent to the York Free school, where he remained for five years. In the meantime both his father and mother had died, and he was reduced to great distress from the want of all pecuniary means, till, in 1664, he was taken under the protection of a brother of his mother's, at whose expense he was sent, in 1666, to Trinity College, Dublin. There he eventually obtained a fellowship, which however he relinquished in 1666, owing to certain conscientious scruples against taking holy orders. In 1672, on his return to Ireland, after having resided some years at Oxford, he made his first appearance as an author by a learned preface, with which he introduced to the public a theological tract of the late Dr. Stearn, who had been his college tutor: it was entitled 'De Obstinatione,' and published at Dublin. Dodwell's next publication was a volume entitled 'Two Letters of Advice: 1. For the Susception of Holy Orders: 2. For Studies Theological, especially such as are Rational.' It appeared in a second edition in 1681, accompanied with a 'Discourse on the Phœnician History of Sanchoiathion,' the fragments of which, found in Porphyry and Eusebius, he contends to be spurious. Meanwhile, in 1674, Dodwell had settled in London, and from this time to his death he led a life of busy authorship. Many of his publications were on the popish and nonconformist controversies; they have the reputation of showing, like everything else he wrote, extensive and minute learning, and great skill in the application of his scholarship, but little judgment of a larger kind. Few, if any, of the champions of the Church of England have strained the pretensions of that establishment so far as Dodwell seems to have done; but his whole life attested the perfect conscientiousness and disregard of personal consequences under which he wrote and acted. In 1688 he was elected Camden Professor of History by the University of Oxford, but was deprived of his office, after he had held it about three years, for refusing to take the oath of allegiance to William and Mary. He then retired to the village of Cookham in Berkshire, and soon after to Shottesbrooke in the same neighbourhood, where he spent the rest of his days. He possessed, it appears, an estate in Ireland, but he allowed a relation to enjoy the principal part of the rent, only reserving such a moderate maintenance for himself as sufficed for his simple and inexpensive habits of life. It is said however that his relation at length began to grumble at the subtraction even of this pittance; and on that Dodwell resumed his property, and married. He took this step in 1694, in his fifty-third year, and he lived to see himself the father of ten children. The works for which he is now chiefly remembered were also all produced in the latter part of his life. Among these are his 'Dissertations and Annotations on the Greek Geographers,' published in Hudson's 'Geographie Veteris Scriptores Græci Minores,' Oxon., 1698, 1703, and 1712; his 'Annales Thucydidei et Xenophontei,' 1696; his 'Chronologia Græco-Romana pro Hypothesibus Dion. Halicarnassensis,' 1692; and his 'Annales Velleiani, Quintilianii, Statiani,' 1698. These several chronological essays, which are drawn up with great ability, have all been repeatedly reprinted. Dodwell's principal work is considered to be his 'De Veteribus Græcorum Romanorumque Cyclis, Obiterque de Cyclo Judæorum ac Fæto Christi, Dissertationes,' 4to, Oxon., 1701. He also published in 8vo., in 1706, 'An Epistolary Discourse, proving from the Scriptures and the first Fathers, that the Soul is a principle

naturally mortal, but immortalised actually by the pleasure of God, to punishment or to reward, by its union with the divine baptismal spirit; where it is proved that none have the power of giving this divine immortalising spirit since the Apostles, but only the Bishops.' This attempt to make out for the bishops the new power of conferring immortality raised no small outcry against the writer, and staggered many even of those who had not seen any extravagance in his former polemical lucubrations. Of course it gave great offence to the Dissenters, all of whose souls it unceremoniously shut out from a future existence on any terms. Dodwell died at Shottesbrooke on the 7th of June 1711. Of his sons, the eldest, Henry, who was a barrister, published anonymously in 1742, a tract, which has been generally, but perhaps erroneously, looked upon as a covert attack upon revealed religion, under the title of 'Christianity not founded on Argument;' and another, William, who was in the church, distinguished himself by some pamphlets in the controversy with Dr. Conyers Middleton about miracles; and also wrote an answer to his brother's anonymous tract just mentioned.

DOLCI, CARLO, was born at Florence, May 25, 1616. His father Andrew, and his mother's father and brother, Pietro and Bartolomeo Marinari, were all painters, and much esteemed and respected in their native city. At the age of four years, Carlo had the misfortune to lose his father, and his mother was obliged to maintain a numerous family by her industry. At the age of nine she placed him with Jacopo Vignali, a pupil of Roselli, who was famous for his powers of teaching. In four years Carlo could paint. His first efforts attracted the notice of Piero de' Medici, an amateur, who procured him the notice of the court, and he was soon busily and profitably employed. In 1654 he married Theresa Bucharrelli, by whom he had a numerous family. About 1670 he was invited to paint the likeness of Claudia, the daughter of Ferdinand of Austria, at Innsbruck, which place he visited for a short time. After his return he was afflicted with melancholy, and he died on Friday, January 17, 1686, leaving one son in holy orders, and seven daughters, of whom Agnese, married to Carlo Baci, a silk merchant, painted in the manner of her father.

Dolci's biographer, Baldinucci, attributes his excellence in painting to the goodness of Heaven, as a just reward for his singular piety, in illustration of which numerous anecdotes are told. When invited to take Claudia's portrait, he declined for fear of the length of the journey, never having lost sight of the cathedral dome and campanile of his favourite city since his birth; and his assent was only procured by obtaining the commands of his confessor, which he obeyed at once. In like manner he was recovered from his first fit of melancholy by the command of his confessor to proceed with a picture of the Virgin. He appears to have been extremely good and amiable, but singularly timid. His last illness is said to have been brought on by a remark which Luca Giordano uttered in joke, according to his intimate friend Baldinucci, that his slowness would never allow him to amass 150,000 dollars as the expeditious Giordano had done, but that he must starve. Upon this, poor Carlo seems to have grown bewildered; fancied that the threatened evil was imminent, and refused food for some time. In the midst of his troubles, his excellent wife died, and death soon released him from his grief. In all his insanity he was never violent, but dejected and helpless, and as obedient as a child to his ghostly adviser.

From his first attempts at painting, Carlo determined to paint none but sacred subjects, and he almost literally observed this rule. His style is pleasing, and full of gentle and tender expressions; his drawing for the most part, but not always, correct; his colouring varied, soft, bright, and harmonious; sometimes too pearly in its tint. He elaborated all he did with the most consummate patience and delicacy. His pictures are numerous, and found in many collections, for he painted many duplicates, and many copies were made by his pupils Alessandro Lomi and Bartolomeo Mancini, and Agnese, his daughter. Onorio Marinari, his cousin and scholar, gave great promise, but died young. (Baldinucci.)

DOLLOND, JOHN, an eminent optician, was descended from a French refugee family, settled in Spitalfields, and born on the 10th of June 1706. His parents were in humble circumstances, his father being an operative silk weaver; and the son was brought up to the same occupation. The little leisure however which he had was spent in the acquisition of a varied circle of knowledge. Besides the study of mathematics and physics, to the latter of which his reputation is chiefly due, he studied anatomy and natural history in general, on the one hand, and theology and ecclesiastical history on the other. In furtherance of this diversified class of subjects, which, considering the toil to which the day was devoted, was sufficiently extensive, he undertook the Greek and Roman classics; he was partially acquainted with several of the modern languages, but with French, German, and Italian he was intimately conversant. Notwithstanding the cares of a family and the duties which it imposed upon him, Dollond still found means to cultivate the sciences; and having apprenticed his eldest son, Peter, to an optical instrument-maker, he was in due time able to establish him in business in Vine-court, Spitalfields. In this business he finally joined his son, for the especial purpose, it would seem, of being able to unite his tastes with his business more perfectly than silk-weaving enabled him to do.

Immediately on this arrangement being completed, Dollond com-

mened a series of experiments on the dispersion of light, and other subjects connected with the improvement of optical instruments, and especially of telescopes and microscopes, the results of which were communicated to the Royal Society in a series of papers. Three of them were printed in the 'Philosophical Transactions' for 1753, one in 1754, and the last in 1755, the titles of which are given below. It was about 1755 that he entered upon a systematic course of experiments on dispersion, and after, to use his own words, 'a resolute perseverance' for more than a year and a half, he made the decisive experiment which showed the error of Newton's conclusions on this subject. The memoir in which the series of investigations was detailed appeared in the 'Philosophical Transactions,' and was the last which he gave to the world. It was rewarded by the council of the Royal Society with the Copley medal.

It was the lot of Dollond to undergo considerable annoyance on account of the claims set up for this discovery in favour of others, especially of Euler; but there is not a shadow of a doubt of Dollond's priority as well as originality, in this very important discovery, left on the minds of the scientific world. The discrepancies which followed the application of Newton's doctrine to the varied cases that presented themselves in the course of different experiments might, in speculative minds, have created a suspicion of the accuracy of that doctrine; yet there does not appear to have been the least hesitation among scientific men in attributing these discrepancies to errors of observation exclusively, and consequently not the least ground for honestly attempting to deprive Dollond of the honour of the discovery.

In the beginning of the year 1761 Dollond was elected a Fellow of the Royal Society, and appointed optician to the king. He did not long survive to enjoy the honour or advantages of his discoveries; as on the 30th of September of that year, he was attacked by a fit of apoplexy, brought on by a too close and long continued application to a paper which he was studying. This attack immediately deprived him of speech, and in a few hours of life itself.

Besides his eldest son Peter, already mentioned (who survived him till 1820, when he died aged ninety), he left another son John, and three daughters. The two sons carried on the business jointly with great reputation and success; and upon the death of the younger in 1804, Peter Dollond took into partnership a nephew, George Huggins, who assumed the name of Dollond, and who continued the business without diminution of the high character attached to the name of Dollond, till his death in May 1832. Mr. George Dollond transmitted the now famous business to a nephew of his, also named George Huggins, and he in his turn obtained the royal permission to assume the surname of Dollond instead of Huggins.

The following is the list of John Dollond's published papers:—1, 'A Letter to Mr. James Short, F.R.S., concerning an Improvement in Reflecting Telescopes;' 'Phil. Trans.,' 1753, p. 103. 2, 'Letter to James Short, A.M., F.R.S., concerning a mistake in Mr. Euler's Theorem for correcting the Aberration in the Object Glasses of Refracting Telescopes;' 'Phil. Trans.,' 1758, p. 287. 3, 'A Description of a Contrivance for measuring Small Angles;' 'Phil. Trans.,' 1753, p. 173. 4, 'An Explanation of an Instrument for measuring Small Angles;' 'Phil. Trans.,' 1754, p. 551. 5, 'An account of some Experiments concerning the different Refrangibility of Light;' 'Phil. Trans.,' 1753, p. 733.

DOLOMIEU, DEODAT-GUY-SILVAIN TANCREDE GRATET DE, was born at Grenoble on the 24th of June 1750. In early youth he was admitted a member of the religious order of Malta, but in consequence of a quarrel with one of his companions which ended in a duel fatal to his adversary he received sentence of death, but after imprisonment he was pardoned, and went to France. After some hesitation whether he should devote himself to classical literature or to natural history, he decided in favour of the latter. While at Metz with the regiment of carbiniers, in which he had obtained a commission, he formed an acquaintance with the celebrated La Rochefoucault, which ceased but with his existence. Dolomieu was soon afterwards elected a corresponding member of the Academy of Sciences, and quitted the military profession.

At the age of twenty-six Dolomieu went to Sicily, and his first labour was an examination of the environs and strata of *Ætna*. He next visited Vesuvius, the Apennines, and the Alps, and in 1783 published an account of his visit to the Lipari Islands. He returned to France at the commencement of the revolution, and early ranged himself on the popular side. He had however no public employment until the third year of the republic, when he was included in the *École de Mines*, then established; and he was one of the original members of the National Institute, founded about the same time. He was indefatigable in the pursuit of geological and mineralogical science, and in less than three years he published twenty-seven original memoirs, among which were those on the nature of *Leucite*, *Peridot*, *Anthracite*, *Pyroxene*, &c.

When Bonaparte undertook the conquest of Egypt, Dolomieu accompanied the expedition. He visited Alexandria, the Delta, Cairo, the Pyramids, and a part of the mountains which bound the valley of the Nile; and he proposed also to explore the more interesting parts of the country, but before he could carry his plan into execution his health became so deranged that he was compelled to return to Europe.

On his passage home he was with his friend Cordier, the mineralogist, and many others of his countrymen, made prisoner after being driven into the Gulf of Tarentum. His companions were soon set at liberty, but the remembrance of the disputes which had existed between him and the members of the Order of Malta led to his removal and subsequent imprisonment at Messina, where he was confined in a dungeon lighted only by one small opening, which, with barbarous precaution, was closely shut every night. The heat, and the small quantity of fresh air admitted by the window of his prison, compelled him to spend nearly the whole of his time in fanning himself with the few tattered remnants of his clothes, in order to increase the circulation of the air. Great exertion and urgent demands were made by the scientific men of various countries to obtain his enlargement; and when, after the battle of Marengo, peace was made with Naples, the first article of the treaty was a stipulation for the immediate release of Dolomieu. On the death of Daubenton he was appointed professor of mineralogy, and soon after his return to France he delivered a course of lectures on the philosophy of mineralogy at the Museum of Natural History.

In a short time Dolomieu again quitted Paris, visited the Alps, and returned to Lyon by Lucerne, the glaciers of Grindelwald and Geneva, and thence to Châteaufort, to visit his sister and his brother-in-law De Drée: here he was attacked by a disorder from the effects of which he died, November 26, 1801.

Dolomieu had projected two journeys for adding to his vast store of geological knowledge—the first through Germany, and the second through Norway, Denmark, and Sweden. He also proposed to publish a work which he had planned in his prison at Messina; of this there was printed a fragment on 'Mineral Species,' which is a monument at once of his misfortunes and his genius, being written in his dungeon in Sicily, on the margin of a few books, with a bone sharpened against his prison-walls for a pen, and the black of his lamp-smoke mixed with water for ink. In this work the author proposes that the integral molecule shall be regarded as the principle by which the species is to be determined, and that no other specific characters should be admitted than those which result from the composition or form of the integral molecule. It must however be admitted as an objection to this proposal that the integral molecule is not always easily ascertained or characterised.

Soon after his death was published, 'Journal du Dernier Voyage du Citoyen Dolomieu dans les Alpes,' edited by Brunn-Nelgard, Paris, 8vo, 1802. M. Dolomieu's numerous 'Mémoires' are contained in the 'Mémoires de l'Institut,' 'Journal des Mines,' 'Journal de Physique,' 'Recueil de l'Académie des Sciences,' and the 'Voyage Pittoresque de Naples et de Sicile;' he also wrote several articles for the 'Dictionnaire Minéralogique,' and the 'Nouvelle Encyclopédie.'

Dr. Thomson, in the 'Annals of Philosophy,' vol. xii., p. 166, has drawn up an elaborate summary of the "results of Dolomieu's observations and the bases of his geological systems."

DOMAT, or DOUMAT, JEAN, a distinguished French civilian, was born at Clermont in Auvergne, on the 30th of November 1625. He connected himself with the brilliant circle of literary recluses at the Port-Royal, among whom his reputation stood high both for jurisprudence and ethics. He was a very modest man, and comparatively little is known of his personal history. For nearly thirty years he presided, with marked credit, in the lower court of judicature at Clermont. He was in the confidence of Pascal, attended him on his death-bed, and was intrusted with many of his papers. His great systematic work on the civil law appears to have long existed and been perused by his friends in manuscript before it was published. Rumours of the value of the work coming to Louis XIV., Domat received a pension, and took up his abode in Paris, where he received encouragement from the kindness of D'Aguesseau, then conseiller d'état, through whose patronage many distinguished jurists appear to have found their way to notice. Domat married Mademoiselle Blondel, by whom he had thirteen children—a circumstance deemed worthy of particular commemoration in France. He died at Paris on the 14th of March 1695, and, notwithstanding his pension and his office, is said to have ended his days in extreme poverty. In his works he stands pre-eminently above all jurists of his age, and acquired a reputation throughout Europe that has hardly been subsequently reached by any of his countrymen. His work, 'Les Loix Civiles dans leur Ordre Naturel, suivies du Droit Public,' appeared anonymously in 1689, and is said to have been for some time attributed to Delauney, professor of jurisprudence in the University of Paris—a statement scarcely reconcilable with the alleged reputation of the work while in manuscript. The author's method of dividing the subject is, by first treating of the rules of law in general. This branch of the work is almost of an ethical character. The principle of every law, as having a foundation in utility or some other reason connected with morals or religion, is the main feature of the work, and in this it adopts the system which was afterwards more elaborately carried out and applied to a larger number of subjects by Montesquieu. The substance of the law is divided into private and public. The former class is subdivided into the law of contracts and the law of succession. The public law is divided into government, official and executorial arrangements, crimes, and procedure civil and criminal. There have been several editions of the work in French, generally in two volumes, folio.

Although intended for the use of Frenchmen, it does not include the provincial peculiarities of tenure, but is nearly an echo of the Roman law purified of matters peculiar to Roman habits and customs, and thus it became a book for Europe at large. In 1722 it was translated into English by William Strahan, 'with additional remarks on some material differences between the civil law and the law of England,' 2 vols. folio. This translation is the most extensive systematic work on the civil law in the English language. Domat paid great attention to mercantile law, and it is believed that this translation has been of extensive service in keeping the mercantile law in general, and the admiralty and consistorial systems of England in unison with the civil law, and consequently with the practice of the rest of Europe. Domat's work used to be in high esteem in Scotland before the study of civil law was neglected at the Scottish bar. A posthumous work by Domat, 'Legum Delectus, ex Libris Digestorum et Codicis,' was published at Amsterdam in 1703, 4to. M. Victor Cousin wrote in the 'Journal des Savants,' 1843, a series of articles on Domat, in which he published some particulars respecting him previously little known.

DOMENICHINO. DOMENICO ZAMPIERI, called DOMENICHINO, was born at Bologna, in 1581, of poor parents. According to some authorities, his first master was Denis Calvart; but Bellori gives him Fiammingo for his first teacher. Fiammingo, entertaining a jealous dislike (says the biographer) to the Caracci, beat his pupil, and turned him out of doors, because he found the boy copying a design by Annibale. On the occasion of his dismissal being made known to Agostino Caracci, he was admitted to the school of the Caracci, and he soon gained one of the prizes which Lodovico customarily distributed, much to the surprise of his fellow-students, who had expected little from a youth of his retiring awkward manners. After visiting Parma, Domenichino went to Rome, where he studied and worked for some time under Annibale Caracci. He afterwards obtained the patronage of Cardinal Geronimo Agucchi, and while he lived in his house painted many pictures for him. Besides painting, he studied architecture, and was appointed architect to the apostolic palace by Gregory XV. After the death of that pontiff, finding himself somewhat reduced in circumstances, and receiving an invitation to Naples, he removed thither with his wife and children. He died at Naples, April 15, 1641. During his life he was much respected. He formed a particularly strict friendship with Albano, in whose house he lived for two years when he first arrived in Rome.

Domenichino was so slow in his early progress as to disappoint many of his friends, and he had the appellation of Bue (ox) among his fellow-students; but Annibale Caracci, who perceived in him the marks of that genius which he afterwards developed, told the jeerers that their nickname was only applicable to the patience and fruitful industry of the laborious student. He retained the utmost deliberation in his mode of working to the last; though when after long reflection he once began to work at his picture he did not leave it until he had completed it. It is said that he had many maxims which justified his slowness, such as, that no line was worthy of an artist which was not in his mind before it was traced by his hand. He was so entirely devoted to his art that he only left his retired study to make sketches and observations upon expression in active life; much of his time was however spent in reading history and poetry.

Domenichino was profoundly studied in his drawing, rich and natural in his colouring, and, above all, correct and life-like in his expression. Annibale Caracci is said to have been decided in his judgment between two pictures of the 'Scourging of St. Andrew,' painted in competition by Domenichino and Agostino Caracci, by hearing an old woman point out with much earnestness the beauties of Domenichino's to a little child, describing every part of it as if it were a living scene, while she passed the other over in silence. To the graver design of the Bolognese school Domenichino added something of the ornamental manner of the Venetian, his pictures being rich in the accessories of architecture and costume. His genius however is not characterised by great invention; he has been accused of borrowing too directly from the works of others, and his draperies are regarded as harsh and too scanty in the folds. Nevertheless, he has been esteemed by the best judges (and among them are the Caracci and Nicholas Poussin) as one of the first of painters, and by some second only to Raffaello. Such however he will never be thought by the world at large.

Domenichino excelled also in landscape, and was famous for his admirable execution of the figures with which he enlivened them. His principal works are at Rome and Naples; among them the 'Communion of St. Jerome,' now placed opposite Raffaello's 'Transfiguration,' in the Vatican, and the 'Martyrdom of St. Agnes,' are the most celebrated. There are three or four of Domenichino's pictures in the National Gallery, London, but neither of them is of any remarkable merit.

DOMINIC, SAINT. Domingo de Guzman, founder of the Order of Dominicans, was born in 1170 at Calahorra, in Castilla la Vieja, Spain. He completed his education at the University of Palencia; in 1193 was made canon of the cathedral of Oseña; and in 1198 a priest and archdeacon. He subsequently became known as an eloquent and earnest preacher, and was sent on missions to various parts of Spain, and into France. Having had his zeal inflamed by the progress of the

Albigenses, he bent all his energies to their conversion. Finding his own efforts insufficient, he appears to have conceived the idea of founding an order of preaching friars, whose special duty should be the conversion of heretics; and about the commencement of the 13th century he began to carry his purpose into effect. He soon found numerous volunteers to his new order, and, to disarm opposition, he and his followers adopted the rule of St. Augustine. As a distinct order they did not however receive the formal verbal approval of the pope, Innocent III., till 1215. This order was confirmed in the following year by a bull of Honorius III., under the name of the Predicants, or Preaching Friars: they were afterwards called Dominicans, from their founder. In England they were known as Black-Friars, from the colour of their habits; in France as Jacobins, from their first house in that country being situated in the Rue St. Jacques, Paris. Dominic was the first general of the order. He was also about the same time created by the pope Master of the Sacred Palace at Rome, an office since always held by a Dominican. The order rapidly increased in numbers, and spread all over Europe: at the dissolution of the monasteries in the reign of Henry VIII. the Dominicans had fifty-eight houses in England and Wales.

Dominic did not however trust for the uprooting of heresy simply to his own preaching and that of his followers. Finding that his eloquence failed to convert the Albigenses, he, with the papal legates, Peter of Castelnau and Rainier of Raoul, obtained permission of Innocent III. to hold courts, before which they might summon by authority of the pope, and without reference to the local bishops, any individuals suspected of heresy, and inflict upon them if obstinate capital punishment, or otherwise any lesser penalty. Peter of Castelnau, who had made himself especially obnoxious by his severity, was killed at Toulouse in 1203; and then was proclaimed by the pope, at the instigation of Dominic, that fearful 'crusade,' as it was designated by Innocent, to which all the barons of France were summoned, and which, under the captaincy of De Montfort, led to the slaughter of so many thousands of these so-called heretics. Dominic himself, it has been said, was not personally cruel; but towards heretics he had no compassion, and it is certain that, so far from attempting to lessen the horrible slaughter, he did what he could to stimulate it. Dominic is very frequently said to have been the founder of the Inquisition: but this is an error. He and his companions in the commission to examine and punish the Albigenses were commonly called 'Inquisitors,' but their commission was merely local and temporary. The 'Holy Office' was not formally established till 1233, when Gregory IX. laid down the rules and defined the jurisdiction of the courts, which he appointed for various countries under the name of 'Inquisitorial Missions.' It is however worthy of notice that the chief inquisitor was a Dominican monk, Pietro da Verona; and that the governance of the Inquisition was placed pretty much in the hands of the Dominicans.

According to the biographers of Dominic, he was permitted to exhibit the divine sanction to his missions by raising the dead to life, as in the case of a young nobleman named Napoleon at Rome, on the Ash-Wednesday of 1218, and by other miracles. Dominic died at Bologna in 1221. He was canonised by Pope Gregory IX. on the 3rd of July 1234: the Church of Rome keeps his festival on the 4th of August. Dominic is said to have written some commentaries upon St. Matthew, St. Paul, and the Canonical Epistles, but they have not come down to us.

DOMINIS, MARCUS ANTONIUS DE, an Italian theologian and natural philosopher, was born in 1566, of an ancient family, at Arba, on the coast of Dalmatia; and, having been educated in a college of the Jesuits at Loretto, he completed his studies at the University of Padua. The progress which he made in the sciences was so satisfactory that the persons in authority at the university used their influence to induce him to enter the order of Jesuits: to this he appears to have consented; and, while passing his novitiate, he gave instruction in mathematics, physics, and eloquence. At the same time he employed his leisure in the study of theology; and it was then that he composed his work entitled 'De Radiis Visus et Lucis in Vitris perspectivis et Iride,' which was published at Venice by one of his pupils in 1611.

The routine of a college life not suiting his taste, De Dominis quitted Padua; and, on the recommendation of the Emperor Rodolphus, he was appointed bishop of Segal. Two years afterwards he was made archbishop of Spalatro; but, while holding this dignity, he became embroiled with the pope (Paul V.) by taking a part in the disputes between that pontiff and the Venetians respecting the endowment of ecclesiastical establishments. On this occasion he threw out a censure on the conduct of the pope; and he further gave offence by entering upon the important but personally dangerous subject of reforming the manners of the clergy.

Being suspected of an inclination in favour of the reformed religion, he found it convenient to consult his safety by resigning his archbishopric and retiring to Venice; this was in the year 1615, and in the following year he came to England, where he experienced a favourable reception from James I. The king appointed him to the deanery of Windsor; and at this time he composed his work entitled 'De Republica Ecclesiastica,' the object of which is to show that the pope has no supremacy over other bishops; it is in two parts, of

which one was published in 1617, and the other in 1620, both in London. The work was much esteemed at the time, but is now scarcely remembered. He also published a sermon, which he preached in 1617, in the chapel belonging to the Mercers' Company; and, in the following year, a work entitled 'Scogli del Cristiano Naufragio quali va scopendo la Santa Chiesa.' De Dominis appears to have been restless and inconstant; for after a few years he expressed a wish to return to the bosom of the Catholic Church, and having received from the pope (Gregory XV.) a promise of pardon, he set out for Rome. Soon after his arrival, some intercepted letters gave indications that his repentance was not sincere, and he was in consequence committed to the castle of St. Angelo, where, after an imprisonment of a few months, he died, September 1624. Being convicted after his death of heresy, his body was disinterred and burnt.

De Dominis has the merit of being the first who assumed that the rainbow was produced by two refractions of light in each drop of rain, with an intermediate reflection from the back part of the drop; and he verified the hypothesis by receiving the ray of light from a globe of glass exposed to the sun in the same manner as the drops of rain are supposed to be situated with respect to that luminary. He knew nothing of the different refrangibilities of the rays of light; and he conceived that the colours were produced by the different forces with which the rays strike the eye in consequence of the different lengths of path described within the drop, by which it was supposed that they retain more or less of the original impulsive force. He erred also in supposing that the rays which formed one of the bows came from the upper part of the sun's disc, and those which formed the other from the lower.

DOMITIANUS, TITUS FLAVIUS, younger son of the Emperor Vespasianus, succeeded his brother Titus as emperor A.D. 81. Tacitus ('Hist.' iv. 51, 68), gives an unfavourable account of his previous youth. The beginning of his reign was marked by moderation and a display of justice bordering upon severity. He affected great zeal for the reformation of public morals, and punished with death several persons guilty of adultery, as well as some vestals who had broken their vows. He completed several splendid buildings begun by Titus; among others an Odeum, or theatre for musical performances. The most important event of his reign was the conquest of Britain by Agricola; but Domitian grew jealous of that great commander's reputation, and recalled him to Rome. His suspicious temper and his pusillanimity made him afraid of every man who was distinguished either by birth and connexions or by merit and popularity, and he mercilessly sacrificed many to his fears, while his avarice led him to put to death a number of wealthy persons for the sake of their property. The usual pretext for these murders was the charge of conspiracy or treason; and thus a numerous race of informers was created and maintained by this system of spoliation. His cruelty was united to a deep dissimulation, and in this particular he resembled Tiberius rather than Caligula or Nero. He either put to death or drove away from Rome the philosophers and men of letters; Epictetus was one of the exiled. He found however some flatterers among the poets, such as Martial, Silius Italicus, and Statius. The latter dedicated to him his 'Thebais' and 'Achilleis,' and commemorated the events of his reign in his 'Silvæ.' But in reality the reign of Domitian was anything but favourable to the Roman arms, except in Britain. In Moesia and Dacia, in Germany and Pannonia, the armies were defeated, and whole provinces lost. (Tacitus, 'Agricola,' 41.) Domitian himself went twice into Moesia to oppose the Dacians, but after several defeats he concluded a disgraceful peace with their chief Decebalus, whom he acknowledged as king, and agreed to pay a tribute, which was afterwards discontinued by Trajan; and yet Domitian made a pompous report of his victories to the senate, and assumed the honour of a triumph. In the same manner he triumphed over the Catti and the Sarmatians, which made Pliny the Younger say that the triumphs of Domitian were always evidence of some advantages gained by the enemies of Rome. In A.D. 95 Domitian assumed the consulship for the seventeenth time, together with Flavius Clemens, who had married Domitilla, a relative of the emperor. In that year a persecution of the Christians is recorded in the history of the Church, but it appears to have been directed particularly against the Jews, with whom the Christians were then confounded by the Romans. Suetonius ascribes the proscriptions of the Jews, or those who lived after the manner of the Jews, and whom he styles as 'improfecti,' to the rapacity of Domitian. Flavius Clemens and his wife were among the victims. [CLEMENS ROMANUS.] In the following year (96), under the consulship of Fabius Valens and C. Antistius Vetus, a conspiracy was formed against Domitian among the officers of his guards and several of his intimate friends, and his wife herself is said to have participated in it. The immediate cause of it was his increasing suspicions, which threatened the life of every one around him, and which are said to have been stimulated by the predictions of astrologers and soothsayers, whom he was very ready to consult. He was killed in his apartments by several of the conspirators, after struggling with them for some time; he was in his forty-fifth year, and had reigned fifteen years. On the news of his death the senate assembled and elected M. Cocceius Nerva emperor.

The character of Domitian is represented by all ancient historians in the darkest colours, as being a compound of timidity and cruelty, of dissimulation and arrogance, of self-indulgence and stern severity

towards others. He punished satirists, but encouraged secret informers. He took a delight in inspiring others with terror, and Dion relates a singular banquet, to which he invited the senators, with all the apparatus of a funeral and an execution. He is also said to have spent whole hours in hunting after and killing flies. At one time, before his becoming emperor, he had applied himself to literature and poetry, and he is said to have composed several poems and other works. (Tacitus, Suetonius, Dion, and Pliny the Younger.)

Coin of Domitian.

British Museum. Actual size. Copper. Weight 432½ grains.

DON, DAVID, was born at Forfar in Scotland, in 1800. His father was proprietor of a nursery and botanic garden in this place, and is well known as having been an acute practical botanist, and one who cultivated the botany of his native country with great success. When David was still a young man his father was appointed to the charge of the botanic garden at Edinburgh, and the knowledge which David then possessed of botany attracted the notice of Mr. Patrick Neill, and other gentlemen connected with the garden, and they procured for him the means of attending on some of the classes in the university. His father however soon quitted Edinburgh, and again opened his garden in Forfar. David afterwards procured a situation in the establishment of Messrs. Dickson of Broughton, near Edinburgh, where he had the care of the finest collection of plants in Scotland. In 1819 he came to London, and was recommended to Mr. Lambert, who had at that time a large collection of plants. He was soon appointed by Mr. Lambert to be his librarian and curator, and lived entirely in his house.

One of his earliest publications was the description of a number of species of plants which were either entirely new, or had only been found in a few localities where they had been collected by his father and others in Scotland. It was entitled 'Descriptions of several New or Rare Native Plants, found in Scotland chiefly by the late Mr. George Don of Forfar,' and was published in vol. iii. of the Memoirs of the Wernerian Society of Edinburgh. He shortly after published in the 'Transactions of the Linnean Society,' vol. xiii. 'A Monograph of the genus Saxifraga;' this attempt at describing the various species of the genus gained for him a reputation as a sound botanist. In 1822 the office of librarian to the Linnean Society became vacant, and he was appointed to that post. In this position he had great opportunities of improving his knowledge of botany. The collections of plants from India in the Linnean Museum turned his attention to that part of the world, and in 1825 he published descriptions of species of plants in Nepal under the title 'Prodromus Floræ Nepalensis,' 12mo. Almost every volume of the 'Transactions of the Linnean Society' after his appointment as librarian contains papers by him on various departments of systematic botany.

On the death of Professor Burnett, in 1836, he was appointed to the chair of botany at King's College, London, a position which he held with great credit to himself and advantage to the institution, till his decease. His numerous papers descriptive of various new genera and species, and on various points in the physiology of plants, which are contained in every volume of the 'Transactions of the Linnean Society,' from vol. xiii. to vol. xviii.; in the 'Memoirs of the Wernerian Society of Edinburgh,' vols. iii.-v.; and in the 'Edinburgh New Philosophical Journal,' vols. ii.-xix., are sufficient proof of his industry: and they have a real value. Don's knowledge of plants was most extensive, and his appreciation of species ready and exact. He was not however fully alive to the importance of studying plants in their morphological relations, and many of his papers are open to criticism on this ground. His constitution was robust and strong, but at the end of 1840 a malignant tumour appeared on his lip, which, although removed at first, speedily reappeared, and terminated his existence on the 8th of December of the same year.

(Proceedings of the Linnean Society.—Don's Works.)

*DONALDSON, THOMAS LEVERTON, Architect, Professor of Architecture in University College London, and author of literary and illustrative works relating to architecture, was born October 17th, 1795, in Bloomsbury Square, London. At nine years of age Donaldson was sent to St. Albans Grammar School, where he remained till the age of fourteen. He then accompanied one of his father's friends to the Cape of Good Hope, whence he was allowed to join the 87th Regiment in the expedition to the Isle of France, with the prospect of receiving a commission. Before Port Louis he had joined those chosen for a storming party, when the place was yielded by the

French without firing a shot. Thus compelled to choose a different path in life he returned to England, and at the age of sixteen began architectural studies under his father, an architect, and in the antique school of the Royal Academy. In 1817 he gained the silver medal. In 1818 he went to pursue his studies abroad, visiting the most interesting localities in Italy, Greece, and Asia Minor. Many of the results of his elaborate researches have been published—some by Colonel Leake. In conjunction with Mr. Jenkins and Mr. Lewis Wolfe he measured the ruins of the temple of Apollo Epicurius at Bassæ, near Phigaleia in Arcadia, whence were afterwards obtained the Phigaleian marbles. There, was discovered a curious variety of the Ionic order, and fragments of a Corinthian column, interesting from the small number of examples of the latter order in Greece. Subsequently, Messrs. Donaldson and Jenkins travelled through Sicily, and also resided for a short time amongst the ruins of Pompeii. Mr. Donaldson next spent a year in Rome, revisited Naples and examined the ruins of Paestum. Afterwards, at Rome, he drew out a design for a temple of Victory according to ancient usages, which procured his election to the Academy of St. Luke, of which Canova was then president. The course of study which Mr. Donaldson had been pursuing was such as was then deemed best for the architect's profession; but it differed in many respects from the course at present. The requirements of professional architecture have now widened. But elaborate illustrated works and present facilities of travel have not been made to afford similar advantages to those which were formerly sought, and the practice of studying the art of architecture from the monuments themselves, has lately been pursued mainly with reference to mediæval works. After visiting the chief cities of Northern Italy, where his drawings procured him election to several of the Academies, Mr. Donaldson returned to England after an absence of nearly five years.

At home his first success was in a competition for the church at Brompton, Middlesex. His studies had been directed to classic art rather than the style chosen, which circumstance was a subject of regret to him; and the design itself was injured by unwise restrictions. In 1827 he supplied architectural details and descriptive letterpress to a folio book on Pompeii, published by W. B. Cooke. In 1830 Mr. Weale published the supplementary volume to Stuart's 'Athens,' edited by Mr. Kinnaird, Mr. Donaldson supplying the matter as regarded the temple at Bassæ, the treasury of Atreus, various details to which his name is attached, and the chapter on the theatre of the Greeks, the latter an admirable exposition of what had been a difficult subject. In 1833 and 1836 appeared his 'Collection of the most approved examples of Doorways from Ancient and Modern Buildings in Greece and Italy,' about which time he was elected a corresponding member of the Institute of France. In 1834 he was invited by some junior members of the profession to co-operate in forming a new architectural society, but was led to put forth the plan of an institution on a more important basis, and on the 15th of June 1835, was inaugurated the Institute of British Architects, Messrs. Donaldson and Charles Fowler being the first secretaries. Somewhat previous to this, at Mr. Donaldson's suggestion, a medal was struck in honour of Sir John Soane, and on the death of that architect in 1837 Mr. Donaldson read at the Institute a memoir of him, afterwards published. Mr. Donaldson during a period of ten years filled the responsible office of Chairman of the Commissioners of Sewers for Westminster and part of the County of Middlesex, superintending and promoting the construction of 50 miles of sewerage, and an expenditure of 300,000*l.*, which onerous duties were wholly gratuitous. In 1843 he was appointed Professor of Architecture and Construction at University College, London. In 1844, on the passing of the Metropolitan Buildings Act (now to be distinguished as that of 7 and 8 Vict.), he was appointed surveyor to the district of South Kensington. He also published in 1847 a small volume of architectural maxims and theorems, and a lecture on the 'Education and Character of the Architect.' On retiring from office as one of the ordinary secretaries of the Institute, the members presented to him a silver candelabrum, value 100 guineas; and in 1851 he had awarded to him the Royal Gold Medal. With Sir Charles Barry and Mr. Cockerell, architects, and Messrs. W. Cubitt, Stephenson, and Brunel, engineers, he was on the Building Committee for the selection of a design for the building of the Great Exhibition of 1851, and with Messrs. Cockerell and Scott on the committee for selection of architectural drawings to be forwarded to the 'Exposition Universelle' of 1855, whereat he himself received from the jury one of the first-class gold medals.

Mr. Donaldson designed and superintended the erection of All Saints' Church, near Gordon-square; the library, Flaxman Hall, and staircase at University College; and was associated with a French architect in the erection of Mr. Hope's residence in Piccadilly; and he has also built the Scots Church, Woolwich, and various houses and churches in the country. In 1840 his design for the Royal Exchange was adjudged to be the best in what was considered to be the first class; but was regarded as not complying in all respects with the requisitions. This however the architect denied. The chief feature was a noble portico, somewhat resembling what exists in the present building. The conduct of the committee with reference to the competitors generally, as too frequently in such cases, justified animadversion; and eventually a second competition was got up, from which

Mr. Donaldson and other competitors were excluded.—Mr. Tite's design being at last carried out. Mr. Donaldson has from time to time, with pains and alacrity, prepared materials of great interest for the Institute—of which body he remains foreign secretary; and his relations with foreign and English architects have enabled him to do considerable service to his professional brethren and to students.

DONATELLO. DONATO DI BELTO DI BARDO, called Donatello, was born at Florence in the year 1383. He was brought up in the house of a Florentine gentleman named Ruberto Martelli, a liberal patron of the arts, and received his first instructions from Lorenzo Biceci, from whom he learned painting in fresco; but he afterwards became more famous as a sculptor. He also practised architecture. In the course of his life he visited many towns of Italy, among which were Venice, Padua (where the people wanted to detain and naturalise him), and Rome. Donatello was much esteemed by his contemporaries, and executed a great number of works, both in private and public buildings, and for the grand-duke Cosmo I. He was the first to employ bas-relief in telling stories, according to the more elaborate style of Italian sculpture. When he first became so infirm as to be unable to work, the grand-duke Piero I. gave him a small estate: but he was so much annoyed by the troublesome references of his labourers, that he insisted on relinquishing it; and Piero gave him a pension instead, in daily payments, which perfectly contented him. He died paralytic, December 13, 1466.

The principal works of Donatello are at Florence; but some have decayed, or been removed from their original station. One, a figure of St. Mark, which was nicknamed (according to the common propensity of the Florentines) *Lo Zucccone* (the Gourd), on account of its bald head, is much commended. A St. George is also much esteemed; and Vasari, speaking of a Judith bearing the head of Holofernes, in bronze, calls it, with all the strength he gathered from his intense love of his art, "A work of great excellence and mastery, which, to him who considers the simplicity of the outside, in the drapery and in the aspect of Judith, sees manifested from within it the great heart (animo) of that woman and the aid of God; as in the air of that Holofernes, wine and sleep, and death in his members, which, having lost their spirit, show themselves cold and falling." Donatello left several pupils, to whom he bequeathed his tools. The most noted are Bertoldo, Nanni d'Anton di Bianco, Rossellino, Desiderio, and Vellano di Padova. To the last he left all the works which he retained at his death. (Vasari; Baldinucci.)

DONATUS, ÆLIUS, a celebrated grammarian, who lived in the middle of the 4th century. He wrote a Grammar, which long continued in the schools; and also Notes upon Terence and Virgil. He was most eminent in the time of Constantius, and taught rhetoric and polite literature at Rome in the year 356, about which time St. Jerome studied grammar under him. Donatus has given ample employment to the bibliographers, who all speak of an 'Editio Tabularis sine ulla nota' of his Grammar, as one of the first efforts at printing by means of letters cut on wooden blocks. (See Meerman, 'Origines Typograph.' of this and other editions, 4to, Hag. Com., 1765, tom. i. pp. 126, 132; *ib.*, pp. 107, 215, 218.) This Grammar has been printed with several titles, as 'Donatus,' 'Donatus Minor,' 'Donatus Ethimolyzatus,' 'Donatus pro puerulis,' &c., but the work is the same, namely, 'Elements of the Latin Language for the use of Children.' In the volume of the 'Grammatici Veteres,' printed by Nic. Jenson, without date, it is entitled 'Donatus de Barbarismo et de octo partibus Orationis.' Dr. Clarke, in his 'Bibliographical Dictionary,' vol. iii. pp. 144-148, has given a long list of editions of Donatus, to which the more inquisitive reader is referred. Donatus's 'Commentarii in quinque Comædiis Terentii,' were first printed without date, probably before 1460, and reprinted in 1471 and 1476. The 'Commentarius in Virgilium,' fol., Ven., 1529, though ascribed to him, is thought by many not to be his.

Donat, in the middle ages, both in English and French, became a synonym for any system of grammar: as in *Piers Plowman*—

"Then drave I me among drapers my Donet to lerne."

In the statutes of Winchester College, written about 1386, grammar is called 'Antiquus Donatus,' the old Donat. Cotgrave quotes an old French proverb, "*Les Diables estoient encores en leur Donat*," "the devils were but yet in their grammar."

(Harles, *Introd. in Hist. Ling. Latinæ*, 8vo, Bremæ, 1773, pp. 202, 203; Clarke, *Bibliogr. Dict.*, *ut supra*; Warton, *Hist. Eng. Poet.*, 4to, vol. i. p. 281; &c.)

DONATUS, Bishop of Casa Nigra in Numidia, from whom, and from another Donatus originated the schismatic sect of the Donatists. Donatus was the great opponent to the election of Cecilianus into the bishopric of Carthage. He accused Cecilianus of having delivered up the sacred books to the Pagans, and pretended that his election was thereby void, and all those who adhered to him heretics. Under this pretext of zeal he set up for the head of a party, and, about the year 312, taught that baptism administered by heretics was ineffectual; that the church was not infallible; that it had erred in his time, and that he was to be the restorer of it. But a council held at Arles, in 314, acquitted Cecilianus, and declared his election valid. The partisans of Donatus, who were very numerous, irritated at the decision, refused to acquiesce in the sentence of the council; and the better to

support their cause, they subscribed to the opinions of Donatus, and openly declaimed against the Catholics. It is said that they gave out that the church was become prostituted; re-baptised the Catholics; trod under foot the hosts consecrated by priests attached to the Holy See; burned their churches: and committed various other acts of violence. They had chosen into the place of Cecilianus one Majorinus, but he dying soon after, they brought in another Donatus, different from him of Casa Nigra, as bishop of Carthage. It was from this new head of the sect, who used so much violence against the Catholics, that the Donatists are believed to have received their name. They appear to have sent one of their bishops to Rome, and to have attempted likewise to send some bishops into Spain, that they might any their church began to spread itself everywhere. They attained their greatest prosperity in the beginning of the 5th century, when they are said to have been little inferior in numbers to the orthodox party in Africa, and to have been directed by four hundred bishops. After many ineffectual efforts to crush this schism, the emperor Honorius ordered a council of bishops to assemble at Carthage in the year 410, where a disputation was held between seven of each party, when it was decided that the laws enacted against heretics had force against the Donatists. The glory of their defeat was due to St. Augustine, bishop of Hippo, who bore the principal part in this controversy. The Donatists however continued as a separate body, and attempted to multiply their sect even in the 6th century; but the orthodox bishops used so much prudence that they insensibly brought over most of those who had strayed from the bosom of the church. The church of the Donatists gradually dwindled to nothing, and became quite extinct in the 7th century. (Broughton, *Dict. of all Religions*, folio, Lond., 1766, pp. 340, 341; Mosheim, *Ecc. History*, 4to, Lond., 1765, vol. i. pp. 211, 214, 259, 305; Moreri, *Dict. Historique*, folio, Paris, 1759, tom. iv. p. 214.)

DONEAU, Latinised DONELLUS, HUGUES, a lawyer, was born at Châlons-sur-Saône, in France, December 23, 1527. He is said to have been idle in his youth, and an anecdote is preserved, according to which he was frightened into diligence by a threat of his father to have him brought up as an assistant to a swineherd. He studied literature at Tournon and jurisprudence at Toulouse, and subsequently at Bourges, where he took a degree as Doctor of Laws in 1551. He soon afterwards began to teach jurisprudence at Bourges, and continued to do so till the massacre of St. Bartholomew in 1572. He had embraced the opinions of the Huguenots, and, dreading to be involved in ruin with others of his persuasion, he made his escape to Geneva, being aided by his pupils, among whom he seems to have been popular, and who had determined to defend his person if he were attacked. After having remained a short time in Geneva, he was called by the Calvinist Elector Palatine Frederic III. to be Professor of Law at Heidelberg. Ludwig IV., the successor of this prince, who did not follow his religious opinions, made changes in the university which drove Doneau thence, and leaving Heidelberg in 1579, he settled in Leyden. Having adopted the faction in favour of the Earl of Leicester, he was obliged to leave Holland and return to Germany. He died at Altorf on the 4th of May 1591. He was a voluminous commentator. His earliest work appears to have been 'In titulum de Usuris in Pandectis Commentarius,' Paris, 1556. A collection of his commentaries was published in five volumes, fol., at Frankfurt, in 1596, and again in 1626, with the title 'Commentariorum de Jure Civili libri xxviii., ex recensione et cum supplementis Scipionis Gentilis.' One of the most complete extant lists of Doneau's works will be found in the printed catalogue of law books in the Advocates' Library, Edinburgh. His Life is in the Supplement of 'Les Vies des plus célèbres Jurisconsultes,' by Taisand.

DONELLUS. [DONEAU.]

DONIZETTI, GAETANO, was born September 25, 1798, at Bergamo, in Northern Italy. He studied in the Lyceum of that town, and his father having originally destined him for the law, it was somewhat late before he commenced his musical studies. He received his first instruction at the Musical Institute of Bergamo, of which Simone Mayer was then director. Here he remained three years, and in 1815 removed to Bologna, where his musical education was completed under Pilotti and Mattei. In consequence of some dispute with his father, he entered into the army, and while in garrison with his regiment at Venice in 1818 produced his first opera, 'Enrico di Borgogna.' He continued to write for the theatre, and in 1822 left the army. His earliest pieces are forgotten, or at least are no longer performed, and it was not till 1830, when he produced 'Anna Bolena' at Milan, that he began to take rank with the higher class of musical composers. In the course of these first twelve years of his career he composed 31 operas. During the fourteen years from 1830 to 1844, when his last opera, 'Catarino Cornaro' was performed, he produced 33 operas, of which several have sunk into oblivion, but others still retain their places on the stages of Italy, Germany, France, and England. Some are especial favourites, and frequently performed. Among these more fortunate productions may be mentioned 'Anna Bolena,' Milan, 1830; 'L'Elisir d'Amore,' Milan, 1832; 'Lucrezia Borgia,' Milan, 1833; 'Marino Faliero,' Paris, 1835; 'Lucia di Lammermoor,' Naples, 1835; 'Betty,' Naples, 1836; 'La Fille du Régiment,' Paris, 1840; 'La Favorite,' Paris, 1840; 'Linda di Chamouni,' Vienna, 1842; 'Don Pasquale,' Paris, 1843; 'Maria di Roban,' Vienna, 1843. Most of these

later operas, besides his usual grace and facility, exhibit strength, solidity, command of the resources of counterpoint, and skill in instrumentation, much superior to his earlier productions. His artistic powers were thus manifestly improving and expanding towards the termination of his musical career. Soon after the performance of his 'Lucia,' which excited great admiration, he was appointed Professor of Counterpoint in the Royal College of Music at Naples, and after the production of 'Linda' at Vienna, he was named chapel-master and composer to the imperial court. In 1845, while in Paris, symptoms of mental decay, arising chiefly from habits of intemperance, began to show themselves, and he was for some time in a lunatic asylum. In October 1847 he was removed to his native town of Bergamo, where he died on the 8th of April 1848. (*Nouvelle Biographie Générale*.)

DONNE, JOHN, was born at London in the year 1573 of respectable parents. At the early age of eleven, being esteemed a good Latin and French scholar, he was sent to the University of Oxford, and after remaining there a few years was removed to Cambridge. Although he greatly distinguished himself in his studies he took no degree, as his family being Roman Catholic had conscientious objections to his making the requisite oath. At the age of seventeen he went to Lincoln's Inn to study the law; and while here, in order to satisfy certain religious doubts, he read the controversies between the Roman Catholics and Protestants, and decided in favour of the latter. After travelling for about a year in Spain and Italy, he became on his return secretary to Lord Elsinore, and fell in love with that nobleman's niece, the daughter of Sir George More. The lady returned his affection, and they were privately married. When this union was discovered by Sir George he was so indignant, that he induced Lord Elsinore to dismiss Donne from his service. The unfortunate secretary was afterwards imprisoned by his father-in-law, and his wife was taken from him; but by an expensive law-proceeding, which consumed nearly all his property, he was enabled to recover her. Sir George forgave him shortly afterwards, but absolutely refused to contribute anything towards his support, and he was forced to live with his kinsman, Sir Francis Whalley. Dr. Morton, afterwards bishop of Gloucester, advised Donne to enter into the Church, and offered him a benefice; but although in great poverty he refused the offer, thinking himself not holy enough for the priesthood. Sir Francis Whalley at last effected a complete reconciliation between Donne and Sir George, who allowed his son-in-law 800*l.* in quarterly sums of 20*l.* each, till the whole should be paid. Still he continued to be in embarrassed circumstances, and after residing some time at Mitcham, whither he had removed for the sake of his wife's health, he lived in the house of Sir Robert Drury, at Drury Lane. He accompanied that gentleman to Paris, contrary to the solicitations of his wife, who could not bear to be parted from him, and who, as she said, felt a foreboding of some evil. While Donne was in Paris, there is a story that he saw the apparition of his wife enter his apartment bearing a dead child, and shortly afterwards received the intelligence that his wife had actually been delivered of a dead child at that very moment. The honest angler, Izaak Walton, who writes Donne's biography, seems inclined to believe this story. On Donne's return to England he was introduced to James I., and delighted the king by a polemic treatise against Catholicism, entitled 'Pseudo-Martyr.' James was so anxious that he should take holy orders, that Donne at length complied, and became the king's chaplain-in-ordinary. His style of preaching is thus described by Walton: "always preaching as an angel from a cloud, but not in a cloud." The University of Cambridge made him doctor of divinity; the benchers of Lincoln's Inn presented him with their lectureship; and after accompanying an embassy to the Queen of Bohemia, James's daughter, he became dean of St. Paul's and vicar of St. Dunstan's, being then in the fifty-fourth year of his age. Falling into a consumption, he was unable to perform his clerical duties; but some enemy having hinted that he merely feigned illness because he was too idle to preach, he mounted his pulpit, and almost in a dying state, preached what Walton has called his "own funeral sermon." This discourse was afterwards printed under the quaint title of 'Death's Duel.' From this time he abandoned all thoughts of life, and even had a portrait painted of himself, enveloped in a shroud, a design apparently for the shrouded effigy afterwards placed as his monument in St. Paul's cathedral: this portrait he kept in his bed-room. Shortly afterwards he died, having exalted himself (according to Walton), almost to a state of angelic beatitude.

Of the real goodness and piety of Donne there can be no doubt. But while we admire these genuine qualities, we must not be blind to the superstitions which were blended with Donne's religion, though these might be attributed partially (but not wholly) to the age. There was evidently a great deal of simplicity about him, as well as about his biographer Walton, who, enthusiastic in his admiration, exalts a weakness as much as his hero's most brilliant qualities. However, to those who wish to see characters like Donne treated in the spirit of their own time, we cannot recommend a more delightful book than Walton's 'Life of Donne.'

As a poet, Donne was one of those writers whom Johnson has (to use Wordsworth's expression) 'strangely' designated metaphysical poets; a more infelicitous expression could not well have been devised. The fact is, that 'quaint conceits' are only the deformities of Donne's

poetical spirit: the man himself had a rich vein of poetry, which was rarely concealed even when most laboriously encumbered, while some of his pieces, both for thought and even melody, are absolute gems. His fault, far from being coldness, is too much erotic fervour; he allows his imagination to run loose, at least in some of his poems written before adopting the ecclesiastical profession, into the most prurient expressions; and in some of his amatory pieces, the conceit stands as a corrective to their excessive warmth. His satires, though written in a measure inconceivably harsh, are models of strength and energy. Their merits were discovered by Pope, who (to use his own odd phrase) translated them into English, but in the process deprived them of no small portion of their strength and freshness.

Donne's principal theological works, besides sermons, are the 'Pseudo-Martyr,' and a treatise against suicide, called 'Bia-thanatos.' His works, edited by the Rev. H. Alford, were published in 1839 in 6 vols. 8vo.

DONOSO CORTÉS, JUAN, an eminent Spanish statesman and author, was born in 1809, of wealthy parents, at the town of El Valle in Extremadura. He was so precocious that at the age of eleven he studied logic at Salamanca, and had completed his legal studies at Seville long before he was competent to be admitted as advocate at the age of twenty-four. He was known to a large circle of friends at Seville as a promising poet, and an ode which he published on the nuptials of King Ferdinand with Maria Christina was particularly distinguished among all those on the occasion. In 1832, when the temporary revocation by Ferdinand of the decree for the succession of the present Queen Isabel (CALOMARDE) awakened the apprehensions of the liberal party that all progress would be checked, a large number of the principal young men of Madrid waited on Queen Christina to offer her their lives in defence of the rights of her infant daughter, and at their head was Donoso Cortés. From this time he was distinguished by the favour of Queen Christina, and entered upon a political career before he was of age to enter on a legal one. A pamphlet however which he composed under the title of a 'Mémorial on the rights of Isabel the Second,' was suppressed by the advice of his friends as containing ideas so ultra-liberal as to be certain to give offence. He was appointed in the same year to a post in the ministry of Grace and Justice, and in the next published his 'Considerations on Diplomacy and its Influence on the Political and Social State of Europe, from the time of the Revolution of July to that of the Quadruple Alliance.'

In 1835 he was sent as a royal commissioner with General Rodil to bring back to obedience his native province of Extremadura, and acted with such success as to receive the grand cross of Carlos III. and a higher official station; but, dissatisfied with the turn that affairs were taking, he resigned his post, and for some time occupied himself in combating the party which supported the revolution of La Granja. He founded the newspaper 'El Piloto,' in which he was assisted by Alcalá Galiano (GALLIANO), and was for some time editor of the 'Revista de Madrid,' a review or rather magazine established on the plan of the French 'Revue des deux Mondes.' His first article in which was one of a series on 'Spain since 1834.' He delivered in 1837 at the Athenæum of Madrid, a series of lectures on the science of politics, which attracted much attention. He was in France in 1840 at the time of the expulsion of Queen Christina, hastened to offer her his services on her arrival in that country, and is said to have been the author of the manifesto which she issued from Marseille. He afterwards went to Madrid on a commission from her to defend her rights against Espartero, but his efforts were unsuccessful. He then returned to France and occupied himself with the composition of a 'History of the Minority of Queen Isabel II.,' passages of which were published in the 'Revista de Madrid,' and have received high applause from Spanish critics. He returned to Spain in 1844 after the fall of Espartero, and was named plenipotentiary to invite Queen Christina back to Madrid, when his services were rewarded with the title of Marquis de Valdegamas. His pen, which never ceased to be active, was by this time active in an entirely different cause from that in which he had first won his laurels. From an ultra-liberal Donoso Cortés had become a Catholic conservative, and after Balme, the most distinguished literary advocate of Catholicism in Spain. He was ambassador to Prussia at the time of the revolution in 1848, and afterwards ambassador to France, a country for which he always avowed a strong partiality. It was while holding that post, and very soon after he had officiated as Spanish ambassador at the marriage of Louis Napoleon with a Spanish consort, that he was seized with an attack of pericarditis, which carried him off, after about a month's illness, on the 3rd of May 1853 at Paris.

A select collection of his writings, 'Colección escogida de los escritos del excelentísimo Señor Don Juan Donoso Cortés,' was published in two volumes at Madrid in 1848. It comprises none of his poetry but most of his political writings that we have mentioned, and several of his articles from the reviews, which seem, like those of Macaulay, to be considered the brightest ornaments of his literary coronet. For brilliancy of style they are remarkable among the general flatness of Spanish composition, but for soundness of thought they are not, we think, likely to acquire a high reputation in England. One of them on Pius IX., bears of the "singular privilege which Italy enjoys in conjunction with Spain of drawing towards itself the attention of the civilized world," and goes on to affirm that "the nations always keep

their eyes fixed by instinct on the Italian and the Spanish race." There is much that is as questionable on most of the subjects on which he touches.

DONOVAN, EDWARD, a writer on various departments of natural history. One of his earliest publications was 'A Natural History of British Insects,' 16 vols. 8vo, commenced in 1792 and finished in 1816. Although at the time this work was published, especially the earlier volumes, it was of great assistance in the study of entomology, it has been surpassed both in execution and matter by more recent works. It will however always be an important work in the history of the literature of entomology. In 1794 he published a little work on the formation of museums of natural history, entitled 'Instructions for Collecting and Preserving various Subjects in Natural History,' 8vo, London. From 1794 to 1797 he published at intervals four volumes of a work containing drawings and descriptions of British birds, entitled 'The Natural History of British Birds,' 8vo. In 1798 he commenced a series of illustrated works on the insects of Asia. These were called 'An Epitome of the Insects of China,' 1798, 4to, London; 'An Epitome of the Natural History of the Insects of India,' 1800, 4to, London; 'An Epitome of the Insects of Asia,' 1798-1805, 3 vols. 4to, London. These works had an extensive sale, and did much for creating a taste for the study of general entomology. In 1805 he published a work entitled 'Descriptive Excursions through South Wales and Monmouthshire in the year 1804 and four preceding Summers,' 2 vols. 8vo, London. In 1823 he commenced a periodical work entitled 'The Naturalist's Repository, or Monthly Miscellany of Exotic Natural History.' Of this work three volumes appeared containing descriptions and drawings of various animals from different parts of the world. He also published 'An Essay on the Minute Parts of Plants in general.' Although constantly occupied on his various works, his profits from them seem to have been small. So great was his dissatisfaction at the small profits which he received from the publishers of his works, that in 1833 he published 'A Memorial respecting my Publications on Natural History,' in which he endeavours to prove that, whilst he had been ruined, those who sold his books had realised large sums.

Science is not indebted to Donovan for any new discovery or important generalisation; but the field which his labours occupied was an important one, and his illustrated works have done much to diffuse a knowledge of and engender a taste for the study of natural history. He died on the 1st of February 1837.

DOO, GEORGE THOMAS, though not the best known, is perhaps the most eminent living English historical engraver. Line-engraving, when executed by the conscientious artist without the assistance of 'prentice hands or mechanical appliances, is in any case a slow process. When the plates are of large size, and require in their progress frequent comparison with the original pictures, years are consumed in their execution. Such have been the character of some of Mr. Doo's works, and such is the natural explanation of his comparatively infrequent appearance before the public; but besides this, it has somehow happened in the present day that the taste for the higher class of line-engravings has passed away, or greatly declined, among English purchasers of modern prints; and while the engravers in mezzotint, and other showy but less elaborate and costly styles, find ample patronage, the historical line-engravers have been left without commissions, and some of the best of them have in consequence, like Mr. Doo, almost or quite abandoned the practice of their profession. The works by which Mr. Doo is best known perhaps are his large and finely conceived plate of 'Knox preaching before the Lords of the Covenant,' after Wilkie; his vigorous rendering of Etty's 'Combat,' his elaborate and exquisitely-finished version of Eastlake's picture of 'Italian Pilgrims coming in Sight of Rome,' the 'Portia and Bassanio' and 'Sterne and the Grisette,' after Newton, prints in their day universally popular; the heads of women and children after Lawrence, such as the 'Lady Meade,' the 'Calveady Children,' and the 'Child with Flowers,' or, in a lower walk, the 'Fair Forester' and the 'Proffured Kiss,' after Wyatt; and lastly, what is by far the best portrait yet published of her majesty, the 'Queen,' after Partridge. But the lover of the highest class of art will cherish as among the choicest examples of modern line-engraving, Mr. Doo's admirable engravings—evidently works of love—from Raffaele's 'Messiah,' and his 'Infant Christ bearing the Cross,' so true in drawing, exquisite in tone, delicate in feeling; and the 'Ecce Homo' of Correggio. As we have indicated above, the style of Mr. Doo is of a rare order of merit. He is always true to the original, yet there is always something of his own in his rendering of it. His handling is firm, his line free, spirited, and masterly, entirely removed from conventionalism and pedantry, while thoroughly conscientious. He is in tone and tint harmonious, yet clear and brilliant. Everywhere he exhibits grandeur and largeness of style combined with a refined and artistic feeling.

Mr. Doo was born January 6, 1800, in the parish of Christ Church, Surrey. He has for some time past resided at Stanmore, and for the last few years has painted in oil numerous small, highly-finished, and very characteristic portraits, chiefly of eminent naturalists. Portraits by him of Bell, Brown, Yarrell, Latham, and Henfrey, were in the Exhibition of the Royal Academy in 1855. From the Royal Academy Mr. Doo has received no mark of professional recognition. His only English professional distinction is the honorary one of Historical Engraver to the Queen. He is an honorary member of the

Society of Arts, Amsterdam, and of the Pennsylvanian Academy of the Fine arts, and a corresponding member of the Academy of the Fine Arts, Parma. Mr. Doo was elected a Fellow of the Royal Society, June 5, 1851.

DOPPELMAYER, JOHANN GABRIEL, a German mathematician, born at Nürnberg in 1671, was the son of a trader in that city, who had distinguished himself by his taste for physics, and is said to have made some improvements in the air-pump. Johann was sent for instruction to Altorf, and he completed his education at the University of Halle, where he applied himself to the study of the law; but, abandoning this pursuit, he cultivated with diligence the different branches of natural philosophy. In 1700 he made a journey to Basel, whence he proceeded to Holland, and he subsequently visited England. After an absence of two years he returned to Nürnberg, where in 1704 he was appointed professor of mathematics and astronomy, which post he held during the remainder of his life. In December 1733 he was admitted a fellow of the Royal Society of London, and in 1740 a member of the academies of Sciences at St. Petersburg and Berlin. He died December 1, 1750.

Doppelmayer was acquainted with the French, Italian, and English languages, besides Latin and his native tongue. He had acquired considerable skill in grinding lenses for object-glasses, and in polishing specula for reflecting telescopes; and in the latter part of his life he distinguished himself by the performance of electrical experiments. He published in German (1714), and also in Latin (1731), an 'Introduction to Geography,' as an accompaniment to the 'Atlas' of Homann; 'Notices of the Mathematicians and Artists of Nürnberg,' in German (1730); and a 'Celestial Atlas,' engraved on thirty plates, with descriptions in Latin (1742); a translation, in Latin, of Street's 'Astronomical Tables'; also translations, in German, of Wilkins's 'Defence of Copernicus,' and of Bion's 'Traité de la Construction, etc., des Instruments d'Astronomie'; but his principal work is one entitled 'Neu-entdeckte Phänomene von Bewundernswürdigen Wirkungen der Natur, welche bey der fast allen Körpern zukommenden electrischen Kraft in einem Systemati vorstellig gemacht,' 4to, Nürnberg, 1774.

DORAT, CLAUDE JOSEPH, was born at Paris, December 31, 1734. He was educated for the bar, but having a considerable fortune, he devoted himself entirely to poetry, and produced a number of tragedies, which, though some were successful, drew on him torrents of ridicule from contemporary wits. He seems however to have attained some reputation as a writer of the lighter class of poems. He had a great passion for bringing out splendid editions of his own works, the cost of which consumed his fortune. He died on the 29th of April 1780. The works of Dorat fill twenty volumes, but they are not highly estimated. *La Harpe* will scarcely allow him mediocrity. '*La Déclamation Théâtrale*,' a work on the proper department of actors, is considered his chef-d'œuvre; but, though it is replete with wholesome advice to performers, it is deficient in everything that can be called poetry. His lighter tales in verse are told with naïveté and humour; of these '*Alphonse*' enjoys the best reputation, but they are terribly indecent. His dramas are entirely forgotten. The edition of the works of Dorat in twenty volumes is adorned with engravings superior to most works of the time; and though we may blame the author for his prodigality, we must not refuse the praise which is due to his taste, considering that these choice engravings were made at his own suggestion.

DORIA, ANDREA, was born in 1466 at Oneglia, in the western Riviera of Genoa, of an ancient noble family, to which Oneglia belonged as an imperial fief. Having lost his parents at an early age, Doria embraced the profession of arms, served under several princes in various parts of Italy, and lastly entered the service of Francis I., who made him commander of his fleet in the Mediterranean. Genoa had been for a long time distracted by factions, which had brought it under the dominion or protection, as it was styled, of the Visconti and Sforza, dukes of Milan. The French having conquered the duchy of Milan, placed a garrison in Genoa, upon condition of respecting the liberties of the citizens, a promise which they kept with the usual faith of conquerors. The citizens were oppressed in various ways, and Doria having remonstrated with the agents of Francis in behalf of his countrymen, a secret order came for his arrest, just after his nephew and lieutenant, Filippino Doria, had gained an important victory for the French over the imperial fleet near the coast of Naples in 1528. The French were then besieging Naples by land. Barbezieux, a French naval officer, was sent to Genoa with twelve galleys to seize on the person of Andrea Doria, who, having had intimation of this design, retired into the Gulf of La Spezia, sent for his nephew to join him with the galleys which he had fitted out at his own expense, and offered his services to Charles V., who received him with open arms. Doria stipulated with Charles that Genoa, as soon as it was freed from the French, should be restored to its independence under the imperial protection, but no foreign garrison or government should be admitted into it. At the same time he engaged to serve the emperor with twelve galleys, fitted out by himself, which number was afterwards raised to fifteen, for which Charles agreed to pay him 90,000 ducats a year.

Doria soon after appeared before Genoa with his little squadron, and, being favoured by the inhabitants, he obtained possession of the city, and drove the French away. It is said that Charles offered him

BIOG. DIV. VOL. II.

the sovereignty of Genoa; but Doria preferred a nobler course. He re-organised the government of the republic, and, in order to extinguish the factions, he named a certain number of families of nobles and citizens, out of which the legislative council was to be chosen annually. New families might be added to the number from time to time. A 'signoria,' or council of sixteen, with a doge, renewed every two years, composed the executive, and five censors were appointed for five years as guardians of the laws. Doria was appointed censor for life, with the title of 'Father and Liberator of his Country.' He now resumed his naval career as admiral of Charles V., and distinguished himself against the Turks and the Barbary pirates. He escorted Charles V. to the expedition of Tunis in 1535, and contributed greatly to the taking of the place. In 1538 he joined the Venetian fleet off Corfu, when he lost the opportunity of attacking, with every chance of success, the Turkish armament commanded by the famous Barbarossa. [BARBAROSSA.] His conduct on the occasion was attributed to secret instructions from the emperor. In 1541 Doria commanded the fleet in the expedition of Charles V. against Algiers, from which he is said to have tried in vain to dissuade the emperor. It turned out as he had foreseen, and he could only save the emperor with a small part of the army. In his old age Doria retired to Genoa, where he lived in great splendour and reputation, the first among his fellow-citizens, respected by all, and consulted upon all matters of importance. Charles V. created him Prince of Melfi and Tarsi in the kingdom of Naples. At the beginning of 1547 his life was threatened by the conspiracy of Fieschi; his nephew Giannettino was murdered, but Andrea escaped, and Fieschi perished in the attempt. A few months after a fresh conspiracy was formed against him by Giulio Cibo, a Genoese emigrant, who however was discovered and executed. In 1548 some of the ministers of the emperor proposed to build a fortress and introduce a Spanish garrison in Genoa, under the pretence of preventing any new conspiracies, but the Genoese appealed to Doria, who interposed and prevented the execution of the project. In 1552, Doria, then eighty-five years old, went to sea again, to attack his old enemies the Turks, who, under Dragut Reis, were ravaging the coast of Naples. Doria lost some of his galleys, which were surprised by the Turks, but Dragut sailed away for the Levant. In 1556 he resigned his command to his nephew, Gian Andrea Doria, who was confirmed as admiral by Philip II. Andrea Doria died in his palace at Genoa, in November 1560, being then ninety-four years of age. He left no issue, and no very large fortune, owing to his splendid way of living and generous disposition. The Genoese paid great honours to his memory, and lamented his death as a public calamity.

Doria was one of the greatest characters that Italy produced during the middle ages, and one of the few that were fortunate to the last. Several individuals of his family have distinguished themselves at various times in the service of the republic of Genoa. A branch of the Doria family are settled at Rome, with the title of princes.

(Casoni, *Annali di Genova*; Botta, *Storia d'Italia*.)

DORIGNY, SIR NICOLAS, a distinguished French designer and engraver, was born at Paris in 1657. He was the son of Michel Dorigny, a painter and engraver of some celebrity in his day, who married Vouet's daughter; but his father died when he was very young, and Nicolas was educated as an advocate. His taste however led him to follow the arts as a profession, and he accordingly went to his brother Louis at Rome, who was, like his father, a painter and engraver, and put himself under his tuition. He lived twenty-eight years in Italy, devoting his time chiefly to etching and engraving, and he became one of the first of the French historical engravers in his style, being inferior to Girard Audran alone. His works are however very hard, though they are drawn with great vigour and abound in expression, and his bold heavy lines appear to have been executed with extreme ease; but there is no delicacy of light and shade or tone in any of his works.

Dorigny engraved many celebrated Italian paintings during his long stay in Italy, including three of the best pictures in Rome: the 'Transfiguration,' by Raffaele, in 1705, on the whole his finest work; the 'Taking Down from the Cross,' by Daniele da Volterra, in 1710; and the 'Lame Man Healed by St. Peter,' by Cigoli. He engraved also the 'Martyrdom of St. Sebastian,' after Domenichino, and other celebrated pictures.

He became acquainted at Rome with some English gentlemen, who persuaded him to visit England for the purpose of engraving the cartoons of Raffaele. He arrived in England in 1711, and commenced his task in the spring of the following year. Queen Anne had given him a room in Hampton Court, with the necessary perquisites. The expense was defrayed by subscription at four guineas the set. The prints were, with the assistance of Charles Dupuis and Claude Dubose, finished April 1, 1719, when he presented two complete sets to George I., who gave him a purse of 100 guineas, and knighted him in the following year. As his sight at length failed him, he determined to desist from further practice, and in 1723 he made a sale of his drawings, and in 1724 returned to Paris. His drawings were sold for 320*l.*, at the sale of which the drawings of the cartoons brought 52 guineas, and a lot of 104 heads and other studies from them, 74*l.*

These heads were afterwards engraved by various French artists, and published with some other studies by John Boydell, under the

title of 'The School of Raffaello, or the Student's Guide to Expression in Historical Painting.' Dorigny was elected a member of the French Academy of Painting in 1725, and died at Paris in 1746. He engraved altogether 163 plates, according to Vertue.

His elder brother Louis was a good fresco-painter; he lived chiefly in Italy, and died at Verona in 1742, aged eighty-eight.

(Vertue, *Catalogue of Engravers, &c.*; Watelet, *Dictionnaire des Arts, &c.*; Huber, *Manuel des Amateurs, &c.*)

DOSSI, DOSSO and GIOBATTISTA, two celebrated Ferrarese painters of the early half of the 16th century. They were born about 1480-1490, in Dossò, near Ferrara, and first entered the school of Lorenzo Costa, after leaving whom they studied together six years in Rome, and five years in Venice. Though they always worked together, they were constantly disputing: Giobattista, the younger, was deformed, and his disposition was the type of his body. He had great skill in landscape and in decoration, but no skill in the human figure. Dossò, on the other hand, was a master in the figure. They were together employed by Alfonso I. and Ercole II., dukes of Ferrara; and Giobattista somewhat against his inclination was forced to execute the accessory parts of his brother's pictures.

There are still several of their joint works in or about Ferrara; they made the cartoons of the tapestries in the cathedral of Ferrara, and of those in the palace and in San Francesco at Modena, representing the deeds of the family of Este, which, according to Vasari, Pordenone was commissioned by Ercole to execute, but he died in 1540, by poison it is alleged, shortly after his arrival at Ferrara for the purpose; Vasari mentions the two Dossi with unjust depreciation. They are praised and enumerated by Ariosto among the other great painters of Italy and the immortal artists of Greece ('Or. Fur.' xxxiii. 2). Dossò painted the portrait of Ariosto, and made illustrations to the Orlando Furioso; he painted also the head of Ariosto in a picture of Paradise on the ceiling of the vestibule of the refectory of the convent of San Benedetto at Ferrara: the portrait is in the possession of the Academy of Sciences of Ferrara, formerly the Academy degli Intrepidi.

There is a good collection of Dossò's oil paintings in the gallery of Dresden, where there are several of his works, the best of which is the four fathers, Saints Gregory, Ambrose, Augustine, and Jerome, disputing on the miraculous conception of the Virgin; the figures are of the size of life, but the style has much of the hardness of the early Italian schools. Dossò survived his brother some years: he died about 1560.

(Frizzi, *Guida di Ferrara*; Lanzi, *Storia Pittorica, &c.*; Valery, *Voyages en Italie.*)

DOUAREN. [DUAREN.]

DOUBLEDAY, EDWARD, a naturalist of eminence, was born in 1810, and died in London in 1849. The family of Doubleday are honourably distinguished for their devotion to natural history pursuits, and the subject of this notice early distinguished himself by his contributions to the literature of Ornithology and Entomology. His first papers were devoted to the subject of entomology, of which many were published in the volumes of the 'Entomological Magazine.' In the early part of his life he made a tour through the United States of America, and made many important observations on the animals of that country. These he published in a paper 'On the Natural History of America,' in the fifth volume of the 'Entomological Magazine.' On his return from America he was appointed one of the curators of the British Museum. The large collections in this institution afforded him abundant materials for increasing his knowledge and developing his views of the structure of insects. The results he made known in a variety of papers, but more especially in his work 'On the genera of Diurnal Lepidoptera.' This work which was published in parts and left unfinished at the author's death, consisted of descriptions, with coloured illustrations of great beauty and accuracy by Mr. Hewitson, of all the genera of butterflies. This family of insects was studied by Mr. Doubleday with the greatest industry, and his contributions to our knowledge of their forms are the most valuable of his labours. He devoted also considerable attention to ornithology, and assisted his brother Henry in publishing a work on this subject. He also contributed a paper 'On the Occurrence of Alligators in East Florida,' to the 'Zoologist.' A list of his papers will be found in the second volume of Agassiz's 'Bibliographia Zoologica,' published by the Ray Society.

DOUCE, FRANCIS, was born in 1762. He was the youngest son of Thomas Douce, who was one of the Six Clerks of the Court of Chancery. Francis was sent to school at Richmond in Surrey, where he learnt Latin and some Greek. He afterwards held a situation in the Six Clerks' office. His father died in 1799, having previously resigned to him his lucrative office as one of the Six Clerks. The bulk of his father's property, which was very considerable, was bequeathed to his elder brother, and the rest was left to himself and his sisters. A very large addition was made to his property in 1822, by Nollekens, the sculptor, who made him one of his executors, and left him nearly one-half of the fortune which he had accumulated. [Nollekens.] Douce was a Fellow of the Antiquarian Society, and was in habits of constant intercourse, both personal and by correspondence, with almost all the leading antiquarians of his time. He was a great collector of scarce books, prints, coins, medals, and all

kinds of curious antiquities. He died at his residence in Gower-street, London, March 30, 1834.

Douce published in 1807 'Illustrations of Shakspeare and Ancient Manners,' 2 vols. 8vo, London. The book was roughly treated by some of the reviews, and the author was greatly offended. He also published, about the beginning of 1834, 'The Dance of Death,' exhibited in elegant Engravings on Wood, with a Dissertation on the several Representations of that Subject, but more particularly of those ascribed to Macaber and Hans Holbein, by Francis Douce, F.A.S., Esq., 8vo, London. The substance of the dissertation had appeared about forty years before, in illustration of Hollar's etchings, published by Edwards, of Pall Mall, London. The engravings, of which there were forty-nine, were executed by Bonner and Byfield, two of the best engravers on wood then living. These are the only works which Douce published separately. He has some essays in the 'Archæologia,' and there are many communications by him to the 'Gentleman's Magazine.'

Douce was a mere antiquarian without any largeness of view even in antiquarian matters. As a critic on Shakspeare, his remarks are of little value when true, and they are frequently erroneous, though sufficiently arrogant. As an illustrator of ancient manners, he has been somewhat more successful.

Douce left his valuable collection of printed books, prints, drawings, illuminated manuscripts, coins, and medals, to the Bodleian Library, Oxford. His miscellaneous antiquities he left to Dr. afterwards Sir Samuel Meyrick, of Goodrich Castle, Wales. The manuscripts of his own writing, together with all his correspondence, he directed to be inclosed in a strong box, and sealed up, and given to the British Museum, with this inscription on the box, "Mr. Douce's Papers, to be opened in the year 1900." If the British Museum refused to accept the box on these terms, it was then to be given to the Bodleian Library.

DOUGLAS FAMILY. This family derives its name from certain lands on the Douglas or Black Water, in the shire of Lanark, which were granted about the middle of the 12th century by Arnold, abbot of Kelso, to one Theobald, a Fleming, whose son was thence called William de Douglas.

William married a sister of Friskin de Kerdal, in the province of Moray, and had several children, all of whom, except the eldest, settled in the north. Brice, the second son, became bishop of Moray; Alexander, the third son, became sheriff of Elgin; and their sister, Margaret, married Hervey de Keith, great marshal of the kingdom.

Archibald, the eldest son, married one of the daughters and co-heiresses of Sir John de Crawford, of Crawford, and had two sons, William and Andrew, each of whom had two sons likewise. William's eldest son married a sister of Lord Abernethy, but dying without issue, was succeeded by his brother, some time governor of the castle of Berwick. Andrew's eldest son married the only daughter of Alexander, lord high steward of Scotland, and had two sons, the eldest of whom was Sir James Douglas of Loudon, so called to distinguish him from his cousin, 'the good Sir James,' one of the chief associates of Bruce in achieving the independence of his country. 'The good Sir James' was made a knight-banneret under the royal standard at Bannockburn, where he commanded the centre division of the Scottish van. He died in a contest with the Saracens when, in fulfilment of the trust committed to him, he was on his way to deposit the heart of Bruce in the Holy Land.

William de Douglas, some time governor of Edinburgh Castle, was a natural son of Sir James of Loudon, whose eldest lawful son, also William de Douglas, had the earldom of Athol conferred upon him on the death of John Campbell without issue; but he soon afterwards resigned the title, and gave a charter of the earldom to Robert, lord high Steward of Scotland. This William de Douglas was lord of Liddesdale, and though himself 'the flower of chivalry,' as he was called, is to be particularly distinguished from Sir William Douglas, the knight of Liddesdale, natural son of the good Sir James. The knight of Liddesdale long merited the eulogy which Fordun gives him, of being "England's scourge and Scotland's bulwark;" but the praise of patriotism, and even of humanity itself, he outlived; for being hurt at Ramsey of Dalwolsay's appointment to the sheriffship of Roxburgh, he waited his opportunity, and came upon the brave and virtuous Ramsey with an armed band, wounded him, and dragged him away to Hermitage Castle. There Douglas immured his unoffending victim, faint with thirst, and with his rankling wounds, till, after a period of seventeen days' suffering, death at length terminated his existence. The government of the country was in such a state at the time, that the king not only could not avenge the outrage, but was obliged to pardon the relentless murderer, and moreover to put him into the vacant sheriffship. He at last died by the hand of an assassin of the house of Douglas.

The good Sir James had another natural son, whom we shall mention presently, but having no lawful issue, he was succeeded by his brothers, Hugh and Archibald, the latter of whom married the daughter of John Cumyn, of Badenoch, by Marjory, sister of John Baliol, king of Scotland, and had two sons, the younger of whom, William, inherited the family estates, and became Earl of Douglas, in which character we find him lord justiciar of Lothian the year in which king Robert II. ascended the throne. He was thrice married. He married

first a daughter of the twelfth Earl of Mar, and in her right was styled Earl of Douglas and Mar. His son James, second Earl of Douglas and Mar, married Margaret, eldest daughter of king Robert II., but leaving no surviving male issue, the earldom of Mar devolved on his sister, and the earldom of Douglas on Archibald Douglas, the natural son of the good Sir James above alluded to, by special settlement. This Archibald, third Earl of Douglas, styled from his great prowess 'Archibald the Grim,' had himself a natural son, who married a daughter of king Robert II.

William, the first Earl of Douglas, had no children by his second marriage. By his third marriage, which was with the Lady Margaret, sister and heir of the third Earl of Angus, he had a son, George, who obtained, on his mother's resignation, a grant of the earldom of Angus. He also got a grant of the sheriffship of Roxburgh, and is found in that office anno 1398. The previous year he married Mary, second daughter of king Robert III.

Sir John Douglas, who gallantly defended the castle of Lochleven against the English in the minority of David II., was a younger brother of William, lord of Liddesdale, above mentioned. He had several children, three of whom only however we shall here notice, James, Henry, and John. The last of these married Mariota, daughter of Reginald de Cheyne, co-justiciar of Scotland beyond the Grampians, with John de Vaux. Sir Henry married a niece of king Robert II., and by her had a son, who married a granddaughter of the same king. Sir James, the eldest, succeeded his uncle, the lord of Liddesdale, in the lordship of Dalkeith and his other extensive possessions. He was twice married, his second wife being a sister of king Robert II. His eldest son, by his first marriage, married a daughter of king Robert III., and had a grandson, who married Johanna, daughter of king James I., and relict of James, third Earl of Angus, and was on the 14th of March 1457-58 created Earl of Morton.

We have thus three earls of the house of Douglas: the Earl of Douglas, the Earl of Angus, and the Earl of Morton.

Archibald IV., earl of Douglas, eldest son of Archibald the Grim, married the eldest daughter of king Robert III., and by her had a son of the same name, who in the lifetime of his father was styled Earl of Wigton. On the death of king James I. he was chosen one of the council of regency, and the next year made lieutenant-general of the realm. His two sons, particularly William, the young Earl of Douglas, despising the authority of an infant prince, and encouraged by the divisions which arose among the nobility, erected a sort of independent power within the kingdom, and forbidding the vassals of the house to acknowledge any other authority, created knights, appointed a privy council, and assumed all the exterior of royalty. They were both at length however beheaded, and the earldom of Douglas passed to a grand-uncle, whose eldest son married his cousin, 'the fair maid of Galloway,' and restored the house to its former splendour. He became lieutenant-general of the kingdom, and no less formidable to the crown than the last in his family who held that high office. But this power proved his ruin, and dying without issue, he was succeeded by his brother, in whom this great branch of the house of Douglas was cut down and overthrown for treason.

Archibald V., earl of Angus, great-grandson of William, first earl of Douglas, through George, who obtained the earldom of Angus on his mother's resignation as above-mentioned, was some time warden of the East Marches, and on the death of Argyll was made lord high chancellor of the kingdom, and so continued till 1498, when he resigned. He was commonly called 'the Great Earl of Angus;' and according to the historian of his house, "was a man every way accomplished both for mind and body." Gawin, bishop of Dunkeld, the translator of Virgil, was his third son by his first marriage, which was with a daughter of the lord high chamberlain of Scotland. The bishop's two elder brothers, George, master of Angus, and Sir William Douglas of Glenbervie, fell on the fatal field of Flodden; and their father, the old earl, who had in vain dissuaded the king from the ruinous enterprise, bending under the calamity, retired into Galloway, and soon after died. Sir Archibald Douglas of Kilspindie, the earl's son by a second marriage, was made lord treasurer of Scotland towards the end of the year 1526, by king James V., who used to style him, his 'Grey Steil;' and the next year we find Archibald VI., earl of Angus, eldest son of the deceased George, master of Angus, lord high chancellor of the kingdom. This Archibald, the sixth earl of Angus, married Margaret of England, queen dowager of James IV., and had by her a daughter, who became the mother of Henry, lord Darnley, husband of Mary, queen of Scots, and father of James I. of England. On the fall of Angus, Sir George, his brother, was exiled, and spent the remainder of James's reign in England; and their sister Jean was burnt as a witch on the castle hill of Edinburgh. The son of Sir George succeeded his uncle as seventh earl of Angus; and on the death of his son, the eighth earl, commonly called "the Good Earl of Angus," without male issue, Sir William Douglas of Glenbervie, great-grandson of Archibald, the great earl, succeeded to the earldom, and had soon afterwards a charter from King James V., confirming all the ancient privileges of the Douglas, namely, to have the first vote in council, to be the king's lieutenant, to lead the van of the army in the day of battle, and to carry the crown at coronations.

The seventh Earl of Angus had a younger brother, who became fourth Earl of Morton, and was the famous Regent Morton. He was

condemned to death for the murder of Darnley, and was executed by the *maiden*, an instrument which he himself introduced into Scotland.

Sir William Douglas of Glenbervie above mentioned conveyed the lands of Glenbervie to a younger son. His eldest son became tenth Earl of Angus; and the son of the latter was in 1633 created Marquis of Douglas, the same year in which another branch of the Douglas family was advanced to be Earl of Queensberry. Archibald, eldest son of the first Marquis of Douglas, officiated as lord high chamberlain at the coronation of king Charles II., and was thereupon created Earl of Ormond. His younger brother William had been some years before created Earl of Selkirk; but marrying afterwards Anne, duchess of Hamilton, he was on her grace's petition created Duke of Hamilton for life, and a new patent of the earldom of Selkirk issued in favour of his younger sons, two of whom were themselves also elevated to the peerage. The third Marquis of Douglas was advanced to be Duke of Douglas; but on his death the dukedom became extinct, and the marquise devolved on the seventh Duke of Hamilton. His grace was one of the parties in the great "Douglas cause," the subject of which was the Douglas estates; but these were ultimately awarded to his opponent, who becoming entitled to the estate, assumed the name and arms of Douglas, and in 1790 was raised to the peerage as Baron Douglas of Douglas castle, in the shire of Lanark.

The year following, George, 16th Earl of Morton, was enrolled among the peers of Great Britain as Baron Douglas of Lochleven. The third Earl of Queensberry had previously been raised to a marquise and dukedom; and the fourth Duke of Queensberry, who was also third Earl of March, made a peer of England by the title of Baron Douglas of Amesbury; but on the death of his grace in 1810, the English barony, conferred upon himself, and the Earldom of March, conferred upon his grandfather, expired; while the dukedom devolved on the Duke of Buccleuch, and the original peerage descended to the Marquis of Douglas.

DOUGLAS, DAVID, was born at Scone, in Perthshire, in 1798, where his father was a working mason. He received a plain education at the parish school of Kinnoull, and was early placed as an apprentice in the garden of the Earl of Mansfield, at Scone Palace. As a lad he was remarkable for his fondness for books and the study of plants. In the winter he devoted his evenings to reading, and in the summer to making botanical excursions for the purpose of collecting the wild plants of the neighbourhood. In 1818 he went to live at Valleyfield, the seat of Sir Robert Preston, Bart., whose garden was then celebrated for its choice collection of exotic plants. Here he was treated with great kindness by the head-gardener, Mr. Stewart, who procured him access to Sir Robert's valuable botanical library. From Valleyfield he removed to Glasgow, where he was employed in the botanic garden of the university. His intelligence attracted the attention of Dr. (now Sir William) Hooker, who was the professor of botany at Glasgow, and he made him his companion in his botanical excursions for the purpose of collecting materials for his 'Flora Scotica.' By Sir William Hooker he was recommended to the Horticultural Society of London as a botanical collector, and in 1823 he was sent to the United States, where he procured many fine plants, and greatly increased the collection of fruit-trees in the possession of the society. In 1824 he was sent by the Horticultural Society to explore the vegetable productions of the country adjoining the Columbia River, and southward towards California. The vessel in which he went out touched at Rio de Janeiro, where he collected many rare orchidaceous plants and bulbs. In the course of his voyage round Cape Horn he shot many rare and curious birds. He visited the island of Juan Fernandez, where he sowed a quantity of garden-seed, with the wish, he says, that he might "add to the collection of a second Robinson Crusoe, should one appear." He arrived at Fort Vancouver, on the Columbia River, in April 1825. During his journey he sent home from time to time large numbers of beautiful plants, with seeds and dried specimens, the latter of which were added to the herbarium of the society at Chiswick. Of the genus *Pinus* he discovered several species of gigantic size, one of which has been named after himself, *P. Douglasii*. In the spring of 1827 he went from Fort Vancouver across the Rocky Mountains to Hudson's Bay, where he met Captain (afterwards Sir John) Franklin, Dr. Richardson, and Captain (now Sir George) Back, returning from their second overland arctic expedition. With these travellers he returned to England, bringing with him the results of his researches. Shortly after his return he was elected, free of expense, fellow of the Linnean, Zoological, and Geological societies. He remained in London two years, and sailed again for the Columbia River in 1829. He afterwards went to the Sandwich Islands, where he had remained some months when an accident put an end to his existence. The natives of the Sandwich Islands are in the habit of making pits, in which they catch the wild bulls. In one of his excursions, Mr. Douglas fell accidentally into one of these pits, in which an infuriated animal was already trapped. The animal fell upon him, and he was found dreadfully mutilated and quite dead. This occurred on the 12th of July 1834.

Of modern botanical travellers, Douglas was one of the most enterprising and successful. Almost all the new hardy plants of our gardens were introduced by him. To him we are not only indebted for many valuable timber-trees, for numerous species of the beautiful genus *Ribes*, and other ornamental shrubs, but the favourites of every

garden—the Clarkias, Penstemons, Enocheras, and Lupines, were almost all first collected by him. A list of all the plants collected by him would occupy too much space, but an idea of the value of his labours may be formed when we mention that of the species commonly growing in our gardens no less than 217 species, belonging to 43 genera, are the result of his various voyages. Of these, 53 are woody plants and 145 herbaceous plants. His dried collection of Californian plants alone consists of about 800 species, but these were only a part of his extensive herbarium. (*Gardener's Magazine*, vols. xi. and xii.; *Companion to the Botanical Magazine*.)

DOUGLAS, GAWIN, was born in the year 1474 or 1475, and was the third son of Archibald, sixth earl of Angus, surnamed Bell-the-Cat. Being intended for the church, he received the best education which Scotland and France could give. He obtained successively the provostship of the collegiate church of St. Giles's, Edinburgh, and the rectorship of Heriot church. He was then made abbot of Aberbrothick, and lastly, bishop of Dunkeld; but his elevation to the archbishopric of St. Andrews was prevented by the pope. In 1513 some political intrigues compelled him to retire to England, where he was favourably received by Henry VIII. He died of the plague in 1521 or 1522, at the Savoy, where he had resided during the whole of his stay.

In his early years he translated Ovid's 'Art of Love,' and composed two allegorical poems, 'King Hart' and the 'Palace of Honour;' but he is best and most deservedly known by his translation of Virgil's 'Æneid,' which, with the thirteenth book by Mapheus Vegius, was produced in 1513. To each book is prefixed an original prologue, some of which give lively and simple descriptions of scenery, written in a manner which proves their author to have been possessed of considerable poetical power. At the end of the work (p. 380, ed. of 1553) he informs us that "compiliet was this work Virgilean . . . in eighteen moneths space," for two months whereof he "wrote never one word."

Those who take the trouble to examine Douglas for themselves, will find his language not nearly so different from our own as might be imagined from a cursory glance at the pages. The chief difference consists in the spelling and the accent, which we may suppose to have borne, as in Chaucer, a considerable resemblance to the present pronunciation of French; at least without some such supposition it appears impracticable to scan either.

(Warton, *Ilist. Engl. Poetry*, who gives copious extracts; *Biog. Brit.*, art. *Douglas*.)

• DOUGLAS, GENERAL SIR HOWARD, BART., was born in 1776, at Gosport, Hampshire. His father, Admiral Sir Charles Douglas, was a distinguished naval officer, who received his title for having in 1776 forced a passage up the river St. Lawrence, in order to relieve the city of Quebec. Sir Charles Douglas was Captain of the Fleet in the West Indies under Admiral Rodney, when the naval action of the 12th of April 1782 was fought between the French and English fleets; and to Sir Charles Douglas has been ascribed, apparently with truth, the merit of suggesting the manoeuvre of breaking through the centre of the French line of battle, and by this operation rendering some of the enemy's ships useless, and thus gaining the victory.

Sir Howard Douglas entered the army at an early age: he served in the expedition to Walcheren, was present at the battle of Coruña, and served in Portugal and Spain in 1808-9. In 1809, on the death of his brother he succeeded to the title, and returned to England. He served again in Spain in 1811-12. Sir Howard Douglas, while thus actively employed in the army, appears not only to have studied his own profession, but to have watched also with peculiar interest the operations of the navy in all parts of the world. In 1816 he published an 'Essay on the Principles and Construction of Military Bridges, and the Passage of Rivers in Military Operations,' 8vo, London. In 1817 he sent to the Lords of the Admiralty the manuscript of his treatise on Naval Gunnery, which, having received their approbation, was published in 1819, 'A Treatise on Naval Gunnery, dedicated by special Permission to the Lords Commissioners of the Admiralty,' 8vo, London. The 3rd edition, revised and much enlarged, was published in 1851, and a 4th edition, revised, in 1856.

Sir Howard Douglas was governor of New Brunswick from 1823 to 1829, in which last year he received the degree of D.C.L. from the University of Oxford. From 1835 to the end of 1840 he was Lord High Commissioner of the Ionian Islands. He was elected member of parliament for Liverpool in 1842, and continued to represent that borough till 1847. He became general in 1851 and also colonel of the 15th Regiment of Foot. Sir Howard Douglas married in 1799, and his wife died in 1854. His son, the heir to the baronetcy, became a lieutenant-colonel in the army in 1842.

The first edition of the 'Treatise on Naval Gunnery' contained certain plans for the establishment of schools of naval gunnery. The government however did nothing towards carrying out the author's recommendations till the political horizon became clouded in 1830, when a gunner-school was instituted on board her Majesty's ship 'Excellent' at Portsmouth, to which was afterwards added a naval college in the dockyard, and the whole establishment has been since extended and improved. The third edition of the 'Naval Gunnery,' as enlarged by the author, is divided into five parts, of which the first part treats of the general organisation and training of gunners, and is

more historical than didactic; the second part deals with the theory and practice of gunnery, more particularly as applied to the service of naval ordnance; the other three parts treat of the construction of guns and mortars, the forms of shot and shell, the machinery of ships of war, the service of guns in action, and the entire theory and practice of naval operations. In the fourth edition, published at the beginning of 1855, Sir Howard Douglas censured very decidedly the whole conduct of the war in the Crimea, and intimated that Sebastopol would not be taken till another plan of operations had been entered upon—till in fact the north side of the harbour had been assaulted and carried by the allies, and the guns of the northern forts directed against the town and forts of the southern side. The result has added another proof to those of previous times of the uncertainty, in matters of actual war, of predictions founded on scientific reasoning.

Besides some 'Observations on Carnot's Fortification,' and 'Considerations on the Value and Importance of the British and North American Provinces,' Sir Howard Douglas published an elaborate exposition of his father's claim to the manoeuvre of the 12th of April 1782, the object of which work will be best explained by giving the title-page in full: 'Naval Evolutions; a Memoir by Sir Howard Douglas, Bart., K.S.B., C.B., F.R.S., &c., containing a Review and Refutation of the principal Essays and Arguments advocating Mr. Clerk's Claims in Relation to the Manoeuvre of the 12th of April 1782, and vindicating by tactical Demonstration and numerous authentic Documents the professional Skill of the British Officers employed on that Occasion,' 8vo, London, 1832.

DOUW, or DOW, GERARD, was born at Leyden in 1618. In 1622 he was put by his father, a glazier, to study drawing under Bartholomew Dolendo, an engraver, with whom he remained eighteen months. He afterwards received the instructions of Peter Kouwhoorn, a painter on glass, and learned his art so well that he proved of great advantage to his father. It being determined that he should study painting in oil, the illustrious Rembrandt was in 1628 chosen for the lad's master. From that great painter Gerard learned the mastery of colour and chiaroscuro, but when he began to practise on his own account he differed entirely from his teacher in his manner of painting. Instead of growing bolder and rougher in his handling as he grew older, he became more and more delicate in his finish, elaborating everything which he touched with the most exquisite delicacy and minuteness, inasmuch that the threads of brocades and of fine carpets are expressed even in his smallest paintings. Nothing escaped his eye or his pencil. And yet, with all his elaboration of detail, his pictures are powerful in effect and harmonious and brilliant in colour. As specimens of technical ability they are admirable, as illustrations of mental power their value is very little. He was accustomed to prepare his own tools, that he might have them of the requisite fineness.

Gerard Douw has been charged with excessive slowness in finishing, and some anecdotes are told in proof of it. Sandrart says that he once visited Gerard's study in company with Bamboccio, and on their both expressing their admiration of a certain miniature broom-handle in one of his pictures, he said that he should spend three more days upon it before he left it: and this story, whether true or not, very fairly illustrates the character of his pictures—the amount of care and thought expended on a broom-handle is precisely the same as is expended on the head of the principal figure in the composition. It is said that his sitters were so wearied by his dilatoriness, and disgusted by the transcripts of their jaded faces, which he faithfully put upon the canvases, that others were deterred from sitting, and he was obliged to abandon portrait-painting. But Karel de Moore, who had been a pupil of his, averred that he was not so slow as had been asserted; and the number of his pictures tends to corroborate his statement. Douw, like most minute finishers, got excellent prices for his paintings, generally from 600 to 1000 florins; and Sandrart informs us that Spiering, a gentleman of the Hague, paid him an annual salary of 1000 florins for the mere right of refusal of all the pictures he painted, at the highest price he could obtain. Gerard Douw died in 1680. The most famous among his pupils was Mieris. His pictures are in all great collections. (Argenville; Sandrart.)

• DOYLE, RICHARD, was born in London in 1826. He is the son of Mr. John Doyle, generally believed to be the author of the celebrated 'H.B.' political sketches which were a few years ago so remarkably popular, and which, while exhibiting with abundant keenness the prominent features and peculiarities of the persons caricatured, were always gentlemanly in feeling and free from any appearance of malice. The younger Mr. Richard Doyle's designs were for some years a chief attraction in the pages of 'Punch,' and possibly no previous pictorial satirist of passing customs and follies ever exhibited so much graceful fancy and playful exuberance of quaint invention and humour. And with all the temptations from the pressure of haste, political excitement, and the necessity of catching the passing whim or hitting the current fault or folly, he never, as far as we can recollect, was charged or chargeable with descending to coarseness or vulgarity. Mr. Doyle possesses a surprising facility and accuracy of drawing, great keenness of observation, and considerable range of character. But he is most at home in London life. Nothing can exceed the infinite variety of his men about town, and their doings, in 'Ye Manners and Customs of ye English;' or the richness of his 'Brown, Jones, and Robinson,' whether at home or abroad. But with his foreigners he is not so

happy; while his sentimental young ladies and gentlemen of the Ethel and Clive Newcome class are "most tolerable and not to be endured." Since he ceased in 1850 to contribute to 'Punch,' Mr. Doyle has illustrated various fairy tales, &c., besides publishing his admirable Christmas book, 'The Foreign Tour of Messrs. Brown, Jones, and Robinson;' but his later works have hardly the light mirthfulness or the vigour of those he executed under the stimulus of constant occupation, constant applause, and the assurance that every satirical or humorous touch would produce its immediate and intended effect.

DRACO, an Athenian legislator, who flourished about the 39th Olympiad, B.C. 621. Suidas tells us that he brought forward his code of laws in this year, and that he was then an old man. Aristotle says ('Polit.,' ii., at the end), that Draco adapted his laws to the existing constitution, and that they contained nothing peculiar beyond the severity of their penalties. The slightest theft was punished capitally as well as the most atrocious murder, and Demades remarked of his laws that they were written with blood, and not with ink. (Plutarch, 'Solon,' cxvii.) Draco however deserves credit as the first who introduced written laws at Athens, and it is probable that he improved the criminal courts by his transfer of cases of bloodshed from the archon to the *ephetai* (Jul. Pollux, viii. 124, 125), since before his time the archon had a right of settling all cases arbitrarily, and without appeal—a right which they enjoyed in other cases till Solon's time. (Bekker's 'Anecdota,' p. 449, l. 23.) It appears that there were some offences which he did not punish with death; for instance, loss of the civil rights was the punishment for a *bekk*, for attempt to alter one of his laws. (Demosth., 'C. Aristocr.,' p. 714, Bekk.) Draco was archon (Pausan., ix. 36, § 8), and consequently an *eupatrid*; it is not therefore to be supposed that his object was to favour the lower orders, though his code seems to have tended to abridge the power of the nobles. He died in the island of *Ægina*. On the legislation of Draco in general, see Wachsmuth, 'Hellenische Alterthumskunde,' ii. 1, p. 239, and following.

DRAKE, SIR FRANCIS, was born in or after the year 1539 (Barrow's 'Life of Drake,' ch. i.) in an humble cottage on the banks of the Tavy, in Devonshire. His father, who was, according to the common accounts, a poor and obscure yeoman, had twelve sons, of whom Francis was the eldest. According to Camden, who derived his information from Drake himself, Francis Russel, afterwards earl of Bedford, stood as his godfather, and John Hawkins, a distinguished navigator, defrayed the slight expenses of his short school education. In the days of persecution under Queen Mary, his father, who was known in his neighbourhood as a zealous Protestant and a man of some acquirements, fled from Devonshire into Kent, where Drake was brought up; "God dividing the honour," says Fuller, "betwixt two counties, that the one might have his birth and the other his education." Under Elizabeth his father obtained an appointment "among the seamen in the king's navy to read prayers to them;" and soon afterwards is stated by Camden and others to have been ordained deacon, and made vicar of Upnor church on the Medway, a little below Chatham, where the royal fleet usually anchored. But there must be some inaccuracy here, as "there is not now and never was either church or chapel at Upnor, but a small castle was built there by Elizabeth to protect the anchorage." (Barrow.) The suggestion of Mr. Barrow has considerable likelihood: "he was more probably one who in those days bore the title of 'preacher' or 'minister,' who had received holy orders, but was without church preferment, and engaged in giving instruction to the neighbouring people, and reading prayers to them."

Francis thus grew up among sailors; and while he was yet very young, his father, "by reason of his poverty, apprenticed him to a neighbour, the master of a bark, who carried on a coasting trade, and sometimes made voyages to Zealand and France." This master kept Drake close to his work, and "pains, with patience in his youth," says Fuller, "knit the joints of his soul, and made them more solid and compact." When his master died, having no children of his own, he bequeathed to young Drake the bark and its equipments. With this he continued in the old trade, and had got together some little money, and was in the fair way of becoming a thriving man, when his imagination was inflamed by the exploits of his protector Hawkins in the New World; and suddenly selling his ship, he repaired to Plymouth, and embarked himself and his fortunes in that commander's last and unfortunate adventure to the Spanish Main. In this disastrous expedition Drake lost all the money he had in the world; he suffered moreover somewhat in character, being charged with having disobeyed orders, and deserted his superior. He however showed skilful seamanship, and brought the vessel he commanded—the 'Judith,' a small bark of fifty tons—safely home. A chaplain belonging to the fleet comforted Drake with the assurance that, as he had been treacherously used by the Spaniards, he might lawfully recover in value upon the King of Spain, and repair his losses upon him whenever and wherever he could. Fuller says, "The case was clear in sea divinity; and few are such infidels as not to believe doctrines which make for their profit. Whereupon Drake, though a poor private man, undertook to revenge himself on so mighty a monarch, who, not contented that the sun riseth and setteth in his dominions, may seem to desire to make all his own where he shineth." Being readily joined by a number of sea adventurers, who mustered

among them money enough to fit out a vessel, Drake made two or three voyages to the West Indies, to gain intelligence and learn the navigation of those parts; but Camden adds, that he also got some store of money there, "by playing the seaman and the pirate." In 1570 he obtained a regular commission from Queen Elizabeth, and cruised to some purpose in the West Indies. In 1572 he sailed again for the Spanish Main, with the 'Pasha' of seventy tons, and the 'Swan' of twenty-five tons, the united crews of which amounted to seventy-three men and boys—the oldest man being fifty, all the rest under thirty years of age. At Port Pheasant on the coast of South America he landed and put together the three pinnaces, of which they had brought the frame-work with them, and here they were joined by another bark, from the Isle of Wight, with thirty-eight men. With this insignificant force he partly plundered the town of Nombre de Dios, and made great spoil among the Spanish shipping. He partially crossed the Isthmus of Darien, and obtained a view of the great Pacific, an ocean as yet closed to English enterprise; and with his eyes anxiously fixed upon its waters, he prayed God to grant him "life and leave once to sail an English ship in those seas." After some extraordinary adventures, Drake returned to England, with his frail barks absolutely loaded and crammed with treasure and plundered merchandise; and on the 9th of August 1573 anchored at Plymouth. It was a Sunday, and the townsfolk were at church; but when the news spread thither that Drake was come, "there remained few or no people with the preacher," all running out to welcome the Devonshire hero. A 'Relation' of this voyage, revised by Drake himself, was published by his nephew in 1646 in a small and now very rare quarto volume. In this 'Relation' Drake himself asserts strongly that the voyage was undertaken by him expressly to avenge himself for his treacherous usage by the viceroy of Mexico.

Drake being employed in the interval in the service of the queen in Ireland, was forestalled in the honour of being the first Englishman to sail on the Pacific by one John Oxenham, who had served under him as common sailor and cook; but as this man merely floated a 'pinnace' on the South Sea, and was taken by the Spaniards and executed as a pirate, he could scarcely be an object of envy.

In 1577, under the secret sanction of Queen Elizabeth, Drake departed on another marauding expedition, taking with him five vessels, the largest of which was of 100, and the smallest of 15 tons. The united crews of this miniature fleet amounted to 164 men, gentlemen and sailors. Among the gentlemen were some young men of noble families, who (not to mention the plunder anticipated) "went out to learn the art of navigation." After many adventures along the coasts of the South American continent, where some of his attacks were completely successful, Drake and his choice comrades came to Port Julian, on the coast of Patagonia, near the Straits of Magalhaens, where they were much comforted by finding a gibbet standing—a proof that Christian people had been there before them. Drake, during his stay in Port Julian, put to death 'Master Doughtie,' a gentleman of birth and education, whose fate is still involved in some mystery, notwithstanding the laudable endeavours of Dr. Southey and Mr. Barrow to rescue the fame of one of our greatest naval heroes from the suspicion of a foul murder.

On the 20th of August Drake reached Cape Virgenes, and sailed through the Strait of Magalhaens, being the third navigator who had performed that passage. On the seventeenth day after making Cape Virgenes he cleared the strait, and entered the Pacific or South Sea. Having obtained an immense booty by plundering the Spanish towns on the coast of Chili and Peru, and by taking, among many other vessels, a royal galleon called the 'Cacafuego,' richly laden with plate, he boldly determined to sail in his little vessel of 100 tons, with its diminished and sickly crew, to the north-east, in the hope of finding in that direction a passage back to the Atlantic. He reached 48° North lat., where the extreme severity of the cold discouraged his men, and contrary winds arising he put back ten degrees, and took shelter in Port San Francisco. Here he established friendly relations with the natives, and formally took possession of the country, which he named New Albion, in the name of the Queen of England. After staying five weeks in that port, he determined to follow the example of Magalhaens, and steer across the Pacific for the Moluccas. He made Ternate, one of the Molucca group, in safety, and thence set his course for Java. From Java he sailed right across the Indian Ocean to the Cape of Good Hope, which he doubled without accident, and thence shaped his course homewards.

Drake arrived at Plymouth on Sunday the 26th of September 1579, after an absence of two years and nearly ten months, during which he had circumnavigated the globe, and spent many months on the almost unknown south-western coasts of America. Drake was most graciously received at court, and Elizabeth now asserted more firmly than ever her right of navigating the ocean in all its parts, and denied the exclusive right which the Spaniards claimed over the seas and lands of the New World. And though the queen yielded so far as to pay a considerable sum out of the treasure Drake had brought home to the procurator of certain merchants who urged, "with some reason," that they had been unjustly robbed, enough was left to make it a profitable adventure for the privateers, who appear to have received payment at the rate of 47*l.* for every 1*l.* ventured. (Barrow, p. 177.) At her orders Drake's ship was drawn up in a little creek near Deptford,

there to be preserved as a monument of the most memorable voyage that the English had ever yet performed: she partook of a banquet on board the vessel, and there knighted the captain.

During part of the year 1585, and the whole of 1586, Drake was actively employed with a fleet of 21 ships, against Philip II. on the coasts of Spain and Portugal, in the Canaries, the Cape de Verdes, the West India Islands, and on the coast of South America and St. Domingo. Carthagena and other towns were taken and plundered. In the course of this expedition Drake visited the English colony in Virginia, which had been recently planted by Raleigh, and finding the colonists in great distress, he took them on board and brought them home with him. It is said that tobacco was first brought into England by the men who returned from Virginia with Drake.

In 1587, when formidable preparations were making in the Spanish ports for the invasion of England, Elizabeth appointed Drake to the command of a fleet equipped for the purpose of destroying the enemy's ships in their own harbours. This force did not amount to thirty sail, and only four were of the Navy Royal, the rest, with the exception of two yachts belonging to the queen, being furnished by merchant adventurers. In the port of Cadiz, the first place he attacked, he found sixty ships and many vessels of inferior size, all protected by land batteries. Drake entered the roads on the morning of the 19th of April, and before night he had burnt, sunk, or taken a hundred ships, some of which were of the largest size; and it appears he might have done much more mischief but for the necessity he was under of securing as much booty, in goods, as he could for the benefit of the merchant adventurers. He then turned back along the coast, taking or burning nearly a hundred vessels between Cadiz and Cape St. Vincent, besides destroying four castles on shore. This was what Drake called "singeing the king of Spain's beard." From Cape St. Vincent he sailed to the Tagus, and entering that river, came to anchor near Cascaes, whence he sent to tell the Marquis Santa-Cruz, who was lying up the river with a large force of galleys, that he was ready to exchange bullets with him. The marquis, who had been appointed general of the Armada preparing for the invasion of England, and who was esteemed the best sailor of Spain, declined the challenge, and he died (the English writers say of vexation at the mischief done by Drake) before that ill-fated expedition could sail.

The operations we have briefly related delayed the sailing of that armament more than a year, and gave Elizabeth time to prepare for her defence. Having thus performed the public service, Drake bore away to the Azores, on the look-out for the treasure ships from India, and he was so fortunate as to fall in with an immense carrack most richly laden. He took it, of course, and "the taking of this ship," says a contemporary, "was of a greater advantage to the English merchants than the value of her cargo to the captors; for, by the papers found on board, they so fully understood the rich value of the Indian merchandises, and the manner of trading into the eastern world, that they afterwards set up a gainful traffic, and established a company of East India merchants." Drake generously spent a considerable part of his prize-money in supplying the town of Plymouth with good, fresh water, for hitherto there was none, except what the inhabitants fetched from a mile distance.

His next service at sea was as vice-admiral in the fleet under Charles Lord Howard of Effingham, lord high admiral of England, which, with the assistance of the elements, scattered and destroyed the 'Invincible Armada' of Spain. The seamanship of Drake, Hawkins, and Frolicher contributed largely to the happy result. In the following year, 1589, Drake was employed as admiral in an expedition sent to Portugal, in the hope of expelling the Spaniards, who had taken possession of that kingdom, by establishing the claims of Antonio, a pretender, around whom the English expected the Portuguese would rally. The whole expedition was badly planned, most miserably supplied with money and the other means of war, and but lamely executed after the landing of the troops.

After his return, Drake was elected member of parliament for Plymouth, and in the session of 1592-93 he appears to have taken an active part, his name appearing upon all the committees upon public business, and he having the charge of several bills. In 1595 Drake and Sir John Hawkins, who had good experience in those parts, represented to Elizabeth that the best place for striking a blow at the gigantic power of Spain was in the West Indies; and an expedition thither was prepared. Drake and Hawkins sailing together with twenty-six ships, of which however only six belonged to the royal navy, on board of which was embarked a land-force under the orders of Sir Thomas Baskerville and Sir Nicholas Clifford. There were too many in command, and Hawkins, who divided the naval command with Drake, was nearly eighty years of age. The usual bad consequences ensued. After losing time in debate which Drake if alone would have spent in action, they were obliged to give up an attempt on the Canaries with some loss. When they got among the West India Islands Drake and Hawkins not only quarrelled but separated for some time, and before reaching the east end of Puerto Rico Hawkins died, his death being generally attributed to the agitation of his mind.

One of Drake's smallest vessels was captured by the Spaniards, who, by putting the crew of it to the torture, extracted information respecting the plans of the expedition. When Drake attacked Puerto Rico he found that place fully warned and prepared, and his desperate

attack was defeated. Sailing away, he took and burned Rio de la Hacha, Rancheria, Santa Martha, and Nombre de Dios, getting no greater spoil than twenty tons of silver and two bars of gold. Drake remained in the harbour of Nombre de Dios, a most unhealthy place, while Baskerville with a part of the land-forces made a vain and ruinous attempt to cross the Isthmus of Darien, in order to plunder and destroy the city of Panamá. A fatal disease broke out among soldiers and sailors, and soon deprived them of the important services of the chief surgeon of the fleet. When many of his men and three of his captains had died, the hardy Drake himself fell sick, and after struggling some twenty days with his malady and the grief occasioned by his failures, he expired on the 27th of December 1595. On the same day the fleet anchored at Puerto Bello, and in sight of that place, which he had formerly taken and plundered, his body received a sailor's funeral, in the words of one of his admiring contemporaries:—

"The waves became his winding-sheet, the waters were his tomb;
But for his fame the ocean sea was not sufficient room."

Though the reputation of Drake as one of the most skilful of English seamen, a commander of almost unparalleled courage, and one of the founders of English naval eminence, is deservedly great and generally admitted, still, unless we judge him by the circumstances and the standard of the times, he must appear in many of his exploits in no other light than that of a daring and skilful buccaner.

(Southey, *Naval History*; Harris, *Collection of Voyages*; Barrow, *Life, Voyages, and Exploits of Admiral Sir Francis Drake*.)

DRAKENBERG, CHRISTIAN JACOBSEN, one of the most extraordinary instances of longevity on record, was born on the 18th of November 1626, at Blomsholm in Norway. The son of a sea-captain, he went in his thirteenth year to sea, and continued a seafaring life till 1691, when in his sixty-eighth year he was captured on a voyage from Hamburg to Spain by Algerine pirates. He continued in slavery at Algiers, Tripoli, and elsewhere till 1710, when, by the assistance of an Englishman named John Smith, he and five other slaves made their escape from Aleppo, and arrived in safety in Smith's vessel at Bordeaux, where Drakenberg heard there was war between Denmark and Sweden, and went home to take part in it. In 1712, Drakenberg, when at Christiania, in a quarrel with Lieutenant Wessel for not taking off his hat to him, was struck by that officer with his sword, on which he wrenched the sword from the lieutenant's hand, and threw it over a house. He was put in irons, but released after an hour's confinement, the officer probably not feeling very well satisfied with himself at having assaulted a man of eighty-six. It was this Lieutenant Wessel who afterwards became, under the name of Admiral Tordenskjold, the most distinguished seaman Denmark has produced.

Drakenberg took his leave of the sea in 1717, on account of weakness of sight, but was still able to do work on land, and in 1728 was taken into the service of Count Danneskjold Samsøe, with whom he afterwards went to Copenhagen. In August 1732, as he was waiting behind the count's chair at table, his master told some of the foreign ministers who were his guests of his servant's being more than a hundred years old; but they refused to believe him. As the conversation was carried on in French they thought Drakenberg did not understand them; but he was acquainted with that language, and was seized with such indignation that he went out of the room, and, without saying a word to any one, set off on foot through Siælland on his way to Norway. On the 2nd of December, in the same year, he procured his baptismal certificate, and in the next February made his reappearance at Copenhagen, after a long journey on foot through Sweden, with the proof that he was then 106 years old. In 1736 he was presented to the King of Denmark; and in 1737, being then in his 111th year, he was married to a widow of sixty, who died a few years after. About 1759 he went to live at Aarhus, and still continued to take long exercises on foot; but his eyelids were then grown so heavy that he could not lift them, and was therefore obliged to have some one to lead him. He died very quietly, after thirteen days' illness, on the 9th of October 1772, at the age of a hundred and forty-five years and more than ten months. His strength was so remarkable that, it is said, on an officer once observing to him, "You are a hundred and twenty years old, I believe," Drakenberg took him by the hand, and pressed it so hard that the officer sunk on his knee. "Now, you see," said Drakenberg, "that I am twenty years old; the hundred I have thrown away." He was of middle size, and very red in the face, but otherwise good-looking. In his food he was dainty, but he was never known to be drunk. He was in disposition lustful, prone to anger, and vindictive.

He was buried in the cathedral of Aarhus, where Schytte, the author of a description of the building, remarks, in 1835, that his body remained after sixty-three years in excellent preservation, a kind of natural mummy, and was made a show of to visitors.

DRAKENBORCH, ARNOLD, was born at Utrecht in 1684, studied in that university under Grævius and Peter Burmann, and at the age of twenty wrote an elaborate dissertation, 'De Prefectura Urbis,' which established his reputation as a scholar. This work treated in eleven chapters of the origin, nature, importance, and various duties and powers, belonging to the office of Prefect of Rome. This valuable little work of Drakenborch has gone through several editions; that of Barenth, 1787, contains an extract from the author's funeral oration

by Professor Oosterdyk, in which the other works of Drakenborch are mentioned. Upon leaving Utrecht he went to Leyden to study the law, but there also he devoted his chief attention to the classical lessons of Perizonius and Gronovius. He wrote in 1707 another dissertation, 'De Officio Præfectorum Prætorio,' in which he explains and illustrates the nature and duties of that important military office, and the changes it underwent in the course of time, in the same manner as he had done for that of the prefects of the city. Drakenborch undertook, by the advice of Peter Burmann, an edition of Silius Italicus, which appeared in 1717. On Burmann's removal to Leyden, Drakenborch succeeded him in the chair of history and eloquence at Utrecht. His edition of Livy, on which he bestowed much time and labour, was published in 1738-46, in 7 vols. 4to. The value of the edition lies in the large collection of various readings, and the illustration of idioms by parallel passages drawn from the writings of Livy. The text is decidedly inferior to that which is found in the unpretending editions by Stroth, Raschig, &c. He published also—'De Utilitate et Fructu humanarum Disciplinarum Oratio inauguralis,' 'Oratio funebris in Mortem Francisci Burmanni,' and other orations and dissertations; and also a 'History of Utrecht,' and 'Genealogies of the Noble Families of Holland.' He died at Utrecht in 1747.

DRAYTON, MICHAEL, was born at Hartshill in the county of Warwick, in the year 1563. His life is involved in great obscurity, and different circumstances concerning him are rather conjectured than affirmed. It is supposed that he went to the University of Oxford, but without taking any degree, and also that he was in the army at an early period of life. Nine or ten years before the death of Queen Elizabeth he is said to have written poems. His earliest work was a collection of pastoral poems, published in 1598, under the title of the 'Shepherd's Garland'; it was afterwards revised and reprinted in 1619, under the name of 'Elogues.' Shortly after the 'Shepherd's Garland' appeared his long historical poems, 'The Barons' Wars,' 'England's Heroical Epistles,' &c. His 'Polyolbion,' a descriptive poem on England, her natural productions and legends, made its appearance in 1613. This is the most celebrated of all his works: independently of its merits as a poem, the most respectable antiquaries refer to it for information, and consider it as authority: the curious Notes appended to it were written by Selden. In 1626 we hear of Drayton as poet-laureate. He died in 1631.

The merits of Drayton as a poet are very great. His historical poems have about them a heavy magnificence, the most gorgeous images and the boldest descriptions follow in stately array, clothed in well-turned and appropriate verse, but unfortunately the obscurity of diction renders them unattractive. The construction is most painfully involved: a nominative case is often parted from its verb by an interval of six or seven lines; and hence, though these poems contain but few obsolete words, the reading of them is a serious study. The same observations will apply to the 'Polyolbion,' which is an immense mass of good sterling matter. All the counties and rivers of England are named one after another, but the descriptions are so close that what we gain in instruction we lose in amusement. This poem is written in Alexandrines, and the measure is admirably managed. 'The Wars of the Barons' are written in ottava rima. Drayton has left one work which, in its way, has never been surpassed—a short fairy poem, called 'Nymphidia.' A more elfin work than this could not be penned: the author has contrived to throw himself into the feelings of the diminutive beings whom he represents. His descriptions of helmets made of beetles, ear-wigs being used as chargers, and other oddities of a like nature, display the very highest powers of fancy: a Lilliputian air breathes through the whole performance. Had Drayton written nothing but 'Nymphidia,' he would deserve immortality.

In Campbell's 'Selections from the British Poets,' a specimen is given of every style in which this fine old author wrote. Drayton has a tomb in Poets' Corner, Westminster Abbey.

DREBBEL, CORNELIUS VAN, was born at Alkmaar, in Holland, in 1572. He is chiefly distinguished by being the inventor of the thermometer; or, at least, by sharing that honour with Santorio. His instrument, which is said to have been first used in Germany in 1621, consisted of a tube of glass containing water and connected with a bulb containing air: by the expansion and contraction of the air, in consequence of the variations of temperature, the column of water was allowed to rise or fall in the tube; and thus the height of the column, being measured by a scale, served as an indication of the temperature.

Drebbel also discovered the means of producing a bright scarlet dye for woollens and silks; and, according to Beckmann, he communicated the discovery to Kuffler, a dyer at Leyden, who had married his daughter. The process was afterwards introduced into France by the persons who established the Gobelins manufacture, the objects of which were celebrated for the brilliancy of their scarlets. It has been asserted that he was the inventor of the telescope and microscope; but it is more probable that he may have made some improvements on those instruments.

The reputation which Drebbel acquired during his life is less due to his useful discoveries than to a pretended knowledge of the causes of many natural phenomena; few persons, in an age of ignorance respecting physical science, being able to impugn his claim to such knowledge. Many of his pretended inventions are palpably fabulous,

or have been absurdly exaggerated by the ignorance and credulity of the narrators. The emperor Rudolph II. granted him a pension, and Ferdinand II. made him the tutor of his son; but a revolution taking place in Austria, he was imprisoned in that country, and, but for the interference of the king of England, James I., he would have been executed. Drebbel spent the rest of his life in this country; and it is said that, on his arrival, he presented to the king a glass globe which exhibited the phenomena of the tides, thunder, and rain, with the sun and planets in perpetual motion; he is also said to have contrived a boat which could be rowed under the surface of water, and in which a person might read without artificial light. He died in London in the year 1634.

Drebbel wrote, in Dutch, two works which were afterwards translated into Latin and French: one of these is on the 'Nature of the Elements, the Winds, Rain,' &c.; and the other on the 'Quintessence,' with the manner of obtaining it from minerals, vegetables, &c.

DREVET, PIERRE, the name of two very distinguished French engravers, father and son. The father was born at Lyon in 1664, and was the pupil of Germain Audran; and, says Watelet, but for his son, who surpassed him, would have been the best portrait-engraver of his own or any previous time. He died at Paris in 1739, aged seventy-five.

PIERRE DREVET, the son, was born at Paris in 1697, and was, it is affirmed, a master in his art in his thirteenth year, when he executed a plate of the 'Resurrection of Christ,' after J. Audré, which, in correctness of drawing and delicacy of execution, is equal to the works of any of his contemporaries: this however may without much hesitation be doubted. In his twenty-sixth, or as some say in his thirtieth, year he produced his masterpiece, the full-length portrait of Bossuet, after Rigaud, in which every object in the picture is executed with great truth and delicacy, and all have a peculiar and characteristic style of execution. He executed several other portraits of nearly equal merit. His style, in the opinion of some, was less adapted for history than for portrait, as being extremely laboured; it drew the attention from the subject as a whole to the parts, and destroyed the unity of effect. Some of his last works are executed in a freer style. He engraved exclusively after French masters, but his works are not numerous. He died at Paris in the same year as his father, 1739.

(Watelet, *Dictionnaire des Arts, &c.*; Huber, *Manuel des Amateurs*; Basan, *Dict. des Graveurs*.)

DROUET D'ERLON, JEAN-BAPTISTE, was born at Rheims, on the 29th of July 1765. At the age of seventeen he enlisted as a private soldier, and, progressively rising by his merit, became aide-de-camp to General Lefèvre, August 14, 1794. He was present at the siege of Valenciennes, and at those of Condé and Quesnay. After an arduous service of eight years under Pichegru, Hoche, and Moreau, he took part as general of brigade in the battle of Zürich under Massena, and was present at the capture of Constanza. After the battle of Hohenlinden, in which he considerably distinguished himself, he was made general of division, August 27, 1800. On October 14, 1806, his well-timed attack on a Prussian column, contributed to the victory of Jena. His skill was conspicuous in the attack and defence of fortified places, and at the siege of Dantzic his exertions were praised by Napoleon himself, who, after the battle of Friedland, in 1807, in which he was badly wounded, bestowed on him the grand cross of the Legion of Honour, with the title of Count d'Erlon, and a pension of 25,000 francs. General Drouet was engaged in the Peninsular war; and at the Col-de-Maya, according to French accounts, he defeated Lord Hill, June 22, 1811. After the restoration of Louis XVIII., he received the command of the 16th Military Division, and was made president of the court-martial by which Excelmans was tried and acquitted. But soon after, being suspected of a share in the conspiracy of General Lefèvre-Desnoettes, he was arrested by orders of his former friend, the Duc de Feltre. The escape of Napoleon from Elba, March 1815, restored him however to liberty. General Drouet was at Waterloo, but, from some mistake, his corps was not brought into action. After this battle he retired to Germany, but returned to France after the amnesty which followed the coronation of Charles X., May 28, 1825. In 1830, after the revolution of July and the accession of Louis Philippe, the name of the Count d'Erlon was replaced on the Army List, and he received the command of the 12th Military Division, stationed at Nantes, where he was present at the arrest of the Duchess of Berry. In 1834 he was appointed governor-general of Algeria, and on the 9th of April 1843 marshal of France. He died on the 25th of January 1844, having been constantly engaged during the wars for 21 years, and 53 years in the service of the French armies.

*DROUYN DE LHUYS, EDWARD, a French statesman and diplomatist, was born at Paris, on the 19th of November 1805. His father's condition secured him a sound education, and afterwards enabled him, at an early age, to enter with advantage upon his political life. In 1821 he became attaché to the French ambassador at Madrid, the Count de Rayneval, who discovered his talents, and soon gave him his entire confidence. Although only in his twenty-sixth year, he at once acquired, and has since retained, that credit and authority as a diplomatist which have since rendered his name so popular. He went to the Hague in 1833 as chargé-d'affaires, and mainly conducted the diplomatic relations at the critical juncture of the transition

when the union of Belgium and Holland was dissolved, and two kingdoms established. The crisis was most difficult, and the maintenance of a good understanding very precarious; but the discretion and conciliatory manners of the *chargés d'affaires* prevented a rupture. King Leopold was much gratified; and Prince Talleyrand, who had watched the progress of the conference, pointed him out to the French government as a young diplomatist of the greatest promise. From 1831 to 1842 M. Drouyn de Lhuys was assiduously engaged in office as a painstaking subaltern, and passed through that long course of training which in France is the prevailing system, and which has produced so many efficient administrators. He was elected to the Chamber of Deputies in 1842.

Even at that time he foresaw a great political change, and longed to remove, or at least mitigate, the evil by timely preparation and amendments. He therefore expostulated with Guizot, who resisted all change, and formed a phalanx of moderate constitutional members, as a barrier between the two contending parties. He recorded his vote in 1845 against Guizot's policy, and was dismissed from office. He then joined the opposition more openly, continued in their ranks until the revolution of February 1848, and was one of those deputies who signed the propositions or list of charges against the ministers, drawn up by Odilon Barrot.

After the accession of the president, Louis Napoleon, M. Drouyn de Lhuys was appointed Minister of Foreign Affairs in the first government formed by him. The election of a new chamber, in 1850, dissolved this government, and he was sent as ambassador to England. Short and interrupted as his residence was at the court of St. James, his conduct in the affair of the Greek Pacifico, joined to his general discretion and good temper, gained him general esteem. After three successive appointments to the French Foreign Office, he addressed, in 1852, those public letters to the several foreign courts which announced the establishment of the French empire, the style and language of which were thought worthy of the occasion. In 1864 his credit was still enhanced by the issue of an exposition of the views of France relative to the war with Russia. But in the conferences at Vienna, in April 1855, he was considered to hold opinions too favourable to Austria; he was therefore superseded, and Count Walewski appointed to his office. This laborious and upright man subsequently became one of the vice-presidents of the senate.

DROZ, FRANCIS-XAVIER-JOSEPH, was born at Besançon on the 31st of October 1778. Having visited Paris for a few months in 1792 he witnessed the massacres of September; after which he returned to Besançon, and enlisted as a volunteer during the national enrolments. His comrades, according to the fashion of the times, elected him as their captain. But after a short service of little better than three years, he quitted the army for ever in 1796, and devoted the rest of his life to study. About the same time he obtained by his family influence the appointment of Professor de Belles Lettres to a public school in his native town; and in 1799 he published his '*Essai sur l'Art Oratoire*.'

In 1802 his school having been suppressed, he went to Paris, where he settled definitively, and became connected with Villemain, Cabanis, and all the leading literati of the time. By the advice of Cabanis, he published his '*Lina*,' a work of fiction in 1804, to attract attention to his philosophical writings. In 1806 appeared his '*Essai sur l'Art d'être Heureux*,' which was followed by an '*Eloge de Montaigne*,' in 1811, for which a medal was awarded to him. From 1816 to 1820 he wrote for several newspapers, inculcating his temperate views of moral philosophy, but refraining from politics. He then joined Picard in writing his '*Mémoires de Jacques Fauvel*,' a tame imitation of Gil Blas; the work appeared in 1823. The next year he carried off the Montyon prize for his treatise: '*De la Philosophie morale, ou des différents Systèmes sur la Science de la Vie*.' In 1825 he was elected a member of the French Academy.

He had long desired to hold a professorship, and at length in 1832 he was appointed to lecture, by authority, at the Institute, on Moral and Political sciences. In 1839 he published his best work, '*L'Histoire du Règne de Louis XVI.*' His gentle and unambitious life came to a close on the 4th of November 1850, when he died as peacefully as he had lived. Although his works are written in a very unpretending style, they will be found well stored with suggestive ideas, and all the principal critics of his country have mentioned them with esteem.

DRUMMOND, CAPTAIN THOMAS, was born at Edinburgh, in October 1797, the second of three sons. His father died whilst he was an infant; his mother removed to Musselburgh, where she resided many years, devoting herself entirely to the education of her children. Drummond was early entered at the High School of Edinburgh, and there formed an acquaintance with Professors Playfair, Leslie, and Brewster, and also with Professors Wallace and Jardine, whose pupil he more especially was. In February 1813 he was appointed to a cadetship at Woolwich. His mathematical abilities soon made him conspicuous, and he passed with very unusual rapidity through all the grades of the academy. Much of his success was doubtless to be attributed to the admirable preliminary education he had received, but much also to a character of determined perseverance, and to the vigorous and well-regulated mind he brought to bear on all subjects. To this it was probably due that he never became exclusively a mathematician, but advanced equally in all the various branches of

study, being at that time, as he continued through life, distinguished for general knowledge and for aptitude to seize on information of every kind. His friend and master, Professor Barlow, notices a circumstance which will illustrate his character: "While a cadet in a junior academy (at Woolwich), not being satisfied with a rather difficult demonstration in the conic sections, he supplied one himself on an entirely original principle, which at the time was published in Leybourne's '*Mathematical Repository*,' and was subsequently taken to replace that given in Dr. Hutton's '*Course of Mathematics*,' to which he had objected. This apparently trifling event gave an increased stimulus to his exertions, and may perhaps be considered the foundation stone of his future scientific fame. After leaving the academy he still continued his intercourse with his mathematical masters, with whom he formed a friendship which only terminated in his much lamented death."

During his preliminary and practical instruction in the special duties of the Engineering Department, his talent for mechanical combinations became conspicuous, and a pontoon which he invented was particularly admired as suitable to its immediate purpose, and remarkably easy of transport, while according to his contemporary and friend, Captain Dawson, to whose information this notice is largely indebted, each section into which it was cut for facility of transport, as well as to prevent it from sinking if injured in any one part, was said by the dockyard-men to whom he showed it, to be easier to row than any boat except a gig. This early period of his career was also largely devoted to the acquisition of military knowledge, partly from the associations around him, and partly from the circumstances of the times. Jomini and Bousmard were his favourite authors, and often has the morning light surprised him in deep discussion on the details of Waterloo and the strategy of the recent campaigns. At Chatham, the practical and varied applications of scientific knowledge brought by Colonel (now General) Pasley to the aid of military science, offered the highest attractions to a mind like Drummond's. Before he joined at Chatham he had served a short time at Plymouth, and after his Chatham course was completed he was stationed at Edinburgh. The duties there offered nothing to engage his attention, relating merely to the charge and repairs of public works; but he was happy in being again thrown among his family and friends, and more in the opportunity again afforded him of pursuing the higher studies in which he delighted, at the college and classes, and among the scientific society of his native city. He found the duties however so trivial, and the prospects of the service so disheartening, that for some time he meditated leaving the army for the bar, and had actually entered his name at Lincoln's Inn with this view. But in the autumn of 1819 he fortunately became acquainted with Colonel Colby, when that officer was passing through Edinburgh on his return from the trigonometrical operations in the Scottish Highlands. The opportunity which these duties afforded him of combining scientific pursuits with the military service induced him to abandon his intention of forsaking the corps, and in the course of the following year an offer from Colonel Colby to take part in the trigonometrical survey was gladly accepted. He had now the advantage of a residence during each winter in London, and, with a definite object in view, again devoted himself, and more closely than ever, to the study of the higher branches of mathematics.

During this period he also devoted considerable attention to the study of chemistry, and attended the lectures of professors Brande and Faraday. The society of his friend Dr. Prout, it is believed, first led his mind to this science, and, with his usual felicity of application, he soon made his new knowledge available to the duties he was employed on. The incandescence of lime having been spoken of in one of the lectures, the idea struck him that it could be employed to advantage as a substitute for argand lamps in the reflectors used on the survey for rendering visible distant stations; because, in addition to greater intensity, it afforded the advantage of concentrating the light as nearly as possible into the focal point of the parabolic mirror, by which the whole light would be available for reflecting in a pencil of parallel rays, whereas of the argand lamp only the small portion of rays near the focus was so reflected. On this subject his first chemical experiments were formed. Captain Dawson recollects Drummond mentioning the idea when returning from the lecture, and that on the way he purchased a blowpipe, charcoal, &c. That evening he set to work, and resolved that he would thenceforth devote to his new pursuit the hour or two before his evening studies began, remarking "how much Dr. Prout had done during the intervals of active professional occupations."

At this period (1824) a committee of the House of Commons recommended that the survey of Ireland should be begun, and that Colonel Colby should make arrangements for carrying it on. The objects of this survey required a work very different from the survey in England. Except himself and a small number of officers, everything was to be formed by Colonel Colby for the work. Instruments of improved construction were required. Among others, a means of rendering visible distant stations was desirable. The recent experience of the Western Islands had shown the probability that in a climate so misty as Ireland the difficulty of distant observations would be greatly increased, and Colonel Colby at once saw the important results which might follow such an improvement of the lamp as that which

Drummond had devised. Under his judicious advice the experiments were prosecuted, and were rapidly attended with success: their progress and results are detailed by the author in the 'Philosophical Transactions' for 1826, as well as the first application of the lamp to actual use in Ireland. When a station, Slieve Snaught, in Donegal, had long in vain been looked for from Davis Mountain, near Belfast, the distance being sixty-six miles and passing across the haze of Lough Neagh, Mr. Drummond took the lamp and a small party to Slieve Snaught, and by calculation succeeded so well in directing the axis of the reflector to the instrument, that the light was seen, and its first appearance will long be remembered by those who witnessed it. The night was dark and cloudless, the mountain and the camp were covered with snow, and a cold wind made the duty of observing no enviable task. The light was to be exhibited at a given hour, and to guide the observer, one of the lamps formerly used, an argand in a lighthouse reflector, was placed on the tower of Randalstown church, which happened to be nearly in the line at fifteen miles. The time approached and passed, and the observer had quitted the telescope, when the sentry cried, "The light!" and the light indeed burst into view, a steady blaze of surpassing splendour, which completely effaced the much nearer guiding beacon.

An apparatus invented by Colonel Colby, consisting of flat plates of polished tin, at angles calculated to reflect the sun's rays in the required direction, was resorted to, and with entire success. It was however somewhat elaborate; because, from the rapid motion of the sun, or rather of the earth, in its orbit, the same pole and set of plates would only answer for a single station, and for a short time on a very few days; the principle however was now obvious, and the elements which had been called into play soon suggested the more perfect instrument. From a calculation, of which the variables were the relative position of two stations and that of the sun, a happy step led to an instrument by which the problem should be as it were solved by construction—a telescope in the line between the objects, connected with one to be directed on the sun and carrying a mirror: such accordingly was the first heliostat of Drummond; its mechanism is described in the paper already referred to ('Phil. Trans.' 1826), and, like the lamp, it was used successfully in the first season of the trigonometrical operations in Ireland. It was originally intended to give this instrument a divided circle, by which its direction could be fixed; but as this was not effected, a theodolite was necessary in conjunction with it, and practice soon showed that if a theodolite were used, a more simple and less costly heliostat might be adopted. This accordingly was devised by Mr. Drummond before the second season; the direction being effected entirely by the theodolite, instead of being as before dependent partly on the theodolite and partly on the adjustments of the heliostat. The telescope of the heliostat now became useless, and it remained a simple mirror moveable in two directions, that is, on a horizontal and on a vertical axis, of which the light was guided by a directing staff previously placed by aid of the theodolite. This instrument proved so satisfactory that it has ever since remained in the form adopted on the survey, and it is every season found more and more useful. By its aid several observations have been made at distances exceeding one hundred miles; and such is its facility of direction—owing also no doubt in some degree to the great divergences which even the best mirrors give to reflected light—that the theodolite is now frequently dispensed with, and by a few simple distances and measurements computed beforehand, a single soldier is sent with a heliostat to some remote mountain or island, with tolerable certainty that his reflection will be seen as soon as the sun shines after he reaches it.

Mr. Drummond's original heliostat was not completed till 1825. A heliostat had also been invented by Professor Gauss, of Göttingen, in the process of a survey carried on by him in Hanover. A very simple one had also been used by the late Commander Mudge, of the Royal Navy, while surveying on the coast of Africa in 1823-24, which consisted merely of a sextant sent forward to the station to be observed, and so adjusted as to throw the sun's light to the observer.

In the autumn of 1824 Colonel Colby made a general reconnaissance of Ireland for the purpose of fixing on the mode of survey, the choice of stations for the great triangulation, and the most fitting place for a base. He selected Mr. Drummond to accompany him on this tour. The Plain of Magilligan was chosen, and Colonel Colby's attention was next directed to a fitting apparatus for the measurement.

Colonel Colby's long experience had shown him the defects of the apparatus formerly employed, and he boldly devised one altogether new, in which compensating expansions were to be used to form an unalterable linear measure. The construction of the instruments required long and careful experiments, the charge of which was confided to Mr. Drummond; and so far as was necessary to prepare the instruments for use in the field, they were performed by him or under his direction. It occurred to him that mica, which had then recently been recommended by Sir David Brewster for pendulum rods, might be applicable to this new purpose. Colonel Colby allowed experiments to be tried on that substance, but they were not satisfactory, and Mr. Drummond abandoned the idea. The apparatus was completed according to Colonel Colby's original plan, and successfully used in the base at Magilligan. In the measurement Mr. Drummond was again employed, and whenever Colonel Colby was absent on other duty the charge of the operations devolved upon him.

BIOG. DIV. VOL. II.

At this period of invention and improvement which preceded the commencement of the survey of Ireland, Mr. Drummond gave some consideration to the barometer, an instrument even now susceptible of improvement, but which had not then received so much attention as it has since. His favourite construction was the siphon, and he made one with his own hands, which performed remarkably well; but he was not in possession of various modes of reading which have since been used: and he devised a singular mode of bisecting a reflected image of the surface—a ghost, as he called it; but he arrived at no permanent or practical result, and at length abandoned the subject from a conviction, to use his own words, that the errors to which the barometer was liable from causes beyond control, were greater than the quantities he had been dealing with. His researches on light, and his intimacy with Professor Leslie, led him to the use of the photometer, the astroscope, and other philosophical instruments of more or less practical utility—among others, Wollaston's thermo-barometer; indeed, at this period so active was his mind and so constant his application, that scarcely an instrument existed that he did not examine and consider, with a view to render it useful for the purposes of the survey; and the elaborate collection with which the meteorological observatory on Divis was furnished, presented a singular spectacle on the mountain-top. He carefully made observations and recorded them, till a calamitous storm destroyed the observatory and all its contents together.

A severe illness which Mr. Drummond contracted from exposure during the Irish survey compelled him to return to Edinburgh, where he was unable to devote himself to study, but he had taken much pains to perfect his light, and he now began to revert to the idea that he had early formed of adapting it to lighthouses. In this he was liberally met by the corporation of Trinity-house, and to it he devoted much of his time during the following winters: the experiments he made, with their success, are detailed in the 'Philosophical Transactions' for 1830. The corporation of Trinity-house placed at his disposal a small lighthouse at Purfleet; and the brilliant effect of the light as seen from Blackwall, where at a distance of ten miles, it was sufficiently strong to cast shadows, made it an object of very general interest. With regard to his share in the application it may be proper to remark, that Mr. Drummond's merit was in rendering practically useful a recondite experiment,—by devising a means of procuring and using without danger agents so turbulent as the mixed gases, making the apparatus sufficiently portable and simple to be employed in the circumstances of exposure required for the survey, and, perhaps more than all, for the happy idea of using this minute spherule of concentrated light as the radiating focus of a parabolic mirror. But the original object of the lamp, its application to lighthouses, presents difficulties which have yet to be overcome. The abstraction of Mr. Drummond's attention at the moment when he was nearest to success, must, so far as the light is concerned, be considered matter of regret.

Mr. Drummond was employed to superintend the very laborious operations necessary to the perfecting the schedules and laying down the boundaries to the old and the new boroughs under the provisions of the Reform Bill. Mr. Drummond was appointed to this commission on the recommendation of Lord Brougham, not however without some severe opposition from one of his colleagues, who doubted much as to the propriety of putting at the head of so important a department a young lieutenant of the Engineers. He however more than justified the expectation formed by his patron.

When the Reform Bill was passed, Mr. Drummond returned to his duties on the survey, and he had made preparation for giving an account of the base before adverted to, when he was again called into public life by being appointed Lord Spencer's private secretary. On the dissolution of the government he received a pension of 300*l.* a year, obtained for him by Lord Brougham, his constant friend.

In 1835 he was made under-secretary for Ireland; he much distinguished himself in the report on railways in Ireland, being at the head of the commission. We shall not attempt to trace his labours as a politician or on the railway commission, but his talents and assiduity were admitted by all, even his strongest political opponents. He laboured incessantly at his duties, and probably hastened his death by his continued application. This took place April 15, 1840, "in the plenitude of mental power and maturity of knowledge, beloved in private and esteemed in public." Soon after his death there was a subscription for a statue, which was executed at Rome, and erected in Dublin.

DRUMMOND, WILLIAM, the son of Sir William Drummond of Hawthornden, was born December 13, 1585. He was educated at Edinburgh, and studied civil law in France. On his father's death in 1610, he relinquished his profession and devoted himself to literary pursuits at his paternal mansion of Hawthornden. He did not however experience that freedom from trials which he had probably anticipated in his retirement. His betrothed bride died on the eve of their marriage; and in order to divert his thoughts from brooding over this deep and bitter affliction, he undertook a tour which lasted eight years, during which time he visited Germany, France, and Italy, and collected a library of great value, of which part is now in the possession of the University of Edinburgh. In his forty-fifth year he married a lady whose fancied likeness to the former object of his

affections is said to have constituted her chief attraction for him. When the civil war broke out, his political bias exposed him to grievous annoyances, particularly that of being compelled to supply his quota of men to serve against the king. This, and regret for Charles's death, shortened and embittered his days, and he died at Hawthornden, December 4, 1649.

Southey has observed that he was the first Scotch poet who wrote well in English. A comparison of his works with those of his predecessors, Douglas and Dunbar, will show the progress made during the 16th century towards fixing and perfecting the language, as well in Scotland as in England. His sonnets, and indeed nearly all his poems, mark strongly that indulgence in sorrow which causes it to take the form of habit, and as such conveys a feeling of passive pleasure by its exercise. The resemblance which his versification presents to that of Milton's minor poems is so striking as only to require mention in order to be acknowledged; and few, we should think, could read his poem on the death of Prince Henry without being reminded of 'Lycidas.' Besides his poetical works, he wrote a history of the five Jameses, kings of Scotland, several pamphlets and tracts, which, with his letters, were published at Edinburgh in 1711. But the work by which he is most commonly known now is the 'Notes of Ben Jonson's Conversations with William Drummond of Hawthornden, January 1619.' These notes though very brief contain a good deal of curious and amusing matter, but the student of English literature should be cautious not to trust them too implicitly. Hawthornden was no Boswell: and his accuracy in repeating Ben Jonson's opinions may fairly be doubted, as he certainly is often inaccurate in repeating his statements of facts. An abstract of these notes was printed in the edition of Drummond's works published in 1711, but it is full of inaccuracies. A correct text, with some useful notes, was for the first time printed in 1842 by the Shakespeare Society under the editorial care of Mr. David Laing, by whom the manuscript was discovered. An edition of the poems of Drummond was published, with a life of the author, by Mr. P. Cunningham, 8vo, Edin., 1852.

DRUSUS, the son of Tiberius by Vipsania, daughter of Agrippa, served with distinction in Pannonia and the Illyricum, and was consul with his father A.D. 21. In a quarrel he had with the favourite Sejanus, he gave him a blow in the face; Sejanus, in revenge, seduced his wife Livia or Livilla, daughter of Drusus the elder and of Antonia, and the guilty pair got rid of Drusus by poison, which was administered by the eunuch Lygdamus. The crime remained a secret for eight years, when it was discovered after the death of Sejanus, and Livia was put to death. (Tacitus, 'Annal.')

DRUSUS, CLAUDIUS NERO, son of Tiberius Claudius Nero and of Livia, was born in the year B.C. 38, three months after his mother's marriage with Augustus. He served early in the army, and was sent in B.C. 17, with his brother Tiberius, against the Rheti and Vindelici, who had made an irruption into Italy. He defeated the invaders, pursued them across the Alps, and reduced their country. Horace celebrated this victory in one of his finest Odes (lib. iv. 4.) Drusus married Antonia Minor, daughter of Antony and Octavia, by whom he had Germanicus and Claudius, afterwards emperor, and Livia or Livilla. In B.C. 14, being sent to quell an insurrection in Gaul occasioned by the extortions of the Roman tax-gatherers, he succeeded by his conciliatory address. In the following year he attacked the Germans, and carrying the war beyond the Rhine, he obtained a series of victories over the Sicambri, Cherusci, Catti, and Tencteri, and advanced as far as the Visurgis, or Weser, for which the senate bestowed the surname of Germanicus upon him and his posterity.

Coin of Drusus.

British Museum. Actual size. Copper. Weight 428½ grains.

In B.C. 9 Drusus was made consul, with L. Quintus Crispinus. He was soon after sent again by Augustus against the Germans, crossed the Visurgis, and advanced as far as the Albis or Elbe. He imposed a moderate tribute on the Frisians, consisting of a certain quantity of hides, which, being afterwards aggravated by the extortion of his successors, caused a revolt under the reign of Tiberius. (Tacitus, 'Annal.' iv. 72.) He caused a canal to be cut, for the purpose of uniting the Rhine to the Yssel, which was known long after by the name of Fossa Drusi; and he also began to raise dykes to prevent the inundations of the Rhine, which were completed by Paulinus Pompeius under the reign of Nero. Drusus did not cross the Albis, probably because he thought he had advanced already far enough: he retired

towards the Rhine, but before he reached that river he died, at the age of thirty, in consequence, as it was reported, of his horse falling upon him and fracturing his leg. (Livy, 'Epitome.') Tiberius, who was sent for in haste, and found his brother expiring, accompanied his body to Rome, where his funeral was performed with the greatest solemnity. Both Augustus and Tiberius delivered orations in his praise. Drusus was much regretted both by the army and by the Romans in general, who had formed great expectations from his manly and generous sentiments. One of his grandsons, Drusus, son of Germanicus and of Agrippina, was starved to death by order of Tiberius, and Nero, the other, was put to death in the island of Ponza.

DRYDEN, JOHN, was born on the 9th of August 1631, at Aldwinckle, in Northamptonshire. He was the eldest son of Erasmus Driden, who was the third son of Sir Erasmus Driden of Canons Ashby, in that county, created a baronet in 1619. The poet was educated as a king's scholar at Westminster School under Dr. Busby, where he wrote some poetic translations, which were much noticed, and, in 1649, an 'Elegy on the Death of Lord Hastings,' and some verses on the 'Divine Epigrams' of John Hoddleston, which were published in 1620. He was elected a Westminster scholar to Trinity College, Cambridge, May 11, 1650. Almost the only notice which the college archives give respecting him is one dated July 19th, 1652, whereby he is "put out of Commons for a fortnight at least," confined to walls, and sentenced to read a confession of his crime at the fellows' table during dinner-time.

In 1654 his father's death put him in possession of an estate worth about 600*l.* per annum (subject to his mother's life interest of a third). He did not however leave Cambridge till three years afterwards, when, having been admitted M.A. by dispensation from the Archbishop of Canterbury, he was introduced into a subordinate public office by his maternal relation Sir Gilbert Pickering. The stanzas on Cromwell's death, his first poem of any importance, were written in the following year, and in 1660 he signalled himself by 'Astrea Redux,' a congratulatory address on the Restoration.

It seems scarcely worth while attempting to excuse this change of views. Dryden was yet a young man, and had probably never before been in a situation to express his own opinions, apart from the influence of his kinsman; and after all, the lines on Cromwell contain, as Sir W. Scott has observed, little or nothing in the way of eulogy which his worst enemies could have denied him. In the year 1663 Dryden began his dramatic career with 'The Wild Gallant.' The plague and fire of London soon interrupted him for a time, and he employed himself upon his 'Essay on Dramatic Poesy,' a performance containing much elegant writing, and worthy of notice as the earliest work of the kind in our language. It would be easy to show the deficiencies and mistakes of this composition, but they are fully counterbalanced by the manly avowal—the first since the Restoration—of the supremacy of Shakspeare. In December 1663 he married a daughter of the first Earl of Berkshire; with her he received a settlement of about 600*l.* a year; and in 1670 he was appointed poet-laureate and historiographer, with a salary of 200*l.* a year; so that, allowing for the then much greater value of money, he must have been in receipt of for the times a very handsome income. On the revival of stage plays, Dryden became one of the most active dramatic writers, and soon acquired so much celebrity that he was engaged to supply the King's Theatre with three plays a year, for the annual sum of 300*l.* to 400*l.* He did not however fulfil his share of the contract. Malone has proved that the number really produced did not amount to more than eighteen in sixteen years.

Towards the end of 1671, the celebrated attack on heroic dramas called the 'Rehearsal' was produced on the stage. Its effect, though sure, was not immediate; except that Dryden exchanged tragedy for comedy, and composed two comedies in 1672. A few years afterwards he took leave of rhyme; his last rhyming tragedy, called 'Aureng-Zebe,' being brought out in 1675; but he continued to write for the stage until 1681, when the struggle between the parties of the dukes of Monmouth and York seemed drawing to a crisis, and there appeared some need that the scurrilous abuse which had been in every way poured on the court party by means of epigram and satire should be rebutted in similar fashion.

This Dryden effected by the famous satire called 'Absalom and Achitophel,' wherein Monmouth figures as Absalom. Monmouth is treated with great levity, but all the vials of the poet's wrath are poured out on Buckingham, the author of the 'Rehearsal,' as Zimri, and on Shaftesbury as Achitophel. The last-named nobleman had been committed to the Tower, not long before, under a charge of high treason: he was however released upon the grand jury's refusal to find a true bill against him, which the Whig party celebrated by a medal struck for the occasion. This afforded Dryden a fresh subject, and in March 1681 appeared 'The Medal,' a bitter lampoon on Shaftesbury, followed up in the next year by 'Mac Flecknoe,' and the second part of 'Absalom and Achitophel,' the larger part of which was written by N. Tate, but revised by Dryden. Together these satires gave the finishing stroke to his old enemies Settle and Shadwell, besides a numerous host of petty satirists. With Settle he had quarrelled some years before, whose chief supporter, Rochester, having become implicated, and suspecting Dryden of indulging anonymous revenge, caused him, in 1679, to be attacked and beaten by hired ruffians.

During the four years from 1682 to 1685 Dryden produced nothing worth notice, with the exception of a translation of Maimbourg's 'History of the League,' undertaken, as Dr. Johnson says, to promote popery. We should be at a loss to account for this apparent want of purpose, but an event which occurred in the year last mentioned clears up the difficulty. Soon after the death of Charles II. Dryden turned Roman Catholic—not without due consideration—as the 'Religio Laici,' written nearly four years before, contains sufficient evidence of his mental struggles at that period, and not, it is to be hoped, otherwise than conscientiously, as indeed his subsequent conduct appears to show. Johnson indeed has hinted, and Macaulay pretty broadly asserted, that the renunciation of Protestantism was made by the "illustrious renegade," as Macaulay designates him, with a view to the personal and pecuniary advantages to be derived from it. Mr. Bell, the most recent biographer of Dryden, has shown however that the additional pension of 100*l.*, with which, as Macaulay says, he was "gratified," by James II. immediately "he declared himself a papist," was not a new grant, but the resumption of an annuity granted by his predecessor about a year before his death, but which had remained unpaid from the decease of Charles—in fact, that it was a formal continuation of a grant "which had lapsed in common with all other personal gratuities by the death of the late king." But Mr. Bell clearly goes too far when he adds that this fact contributes "materially to remove the suspicion hitherto attached to this pension." It shows that Macaulay, who seems to entertain for the memory of Dryden a kind of personal ill-feeling, made an assertion somewhat broader and more positive than was quite justifiable; but of course the renewal of a lapsed annuity may be as much the 'gratification' for a service performed, or a reasonable apostasy, as the granting of a new pension. Still, as we have said already, the whole tenor of Dryden's subsequent life speaks for his conscientiousness on this occasion. Moreover, Dryden was a poet, and, as his 'Religio Laici' showed, a high churchman, and any one who observed the course of reasoning which, on a well-known occasion a few years back, led many adherents of the high church portion of the establishment, whose views were to a great extent a matter of sentiment and feeling, to pass over to the Church of Rome (as Dryden did) "with the crowd," will shrink from branding him as a renegade and a barterer of his faith for a paltry pension, so long as no direct evidence is brought to prove him one. Dryden, we may add, educated his sons as Roman Catholics, and himself remained in strict connection with that church to his death: it ought to be noticed further, that when William III. had become firmly established on the throne, and the court seemed disposed to look kindly on the veteran poet, Dryden, as late as 1699 (the year before his death), in announcing his willingness to promise his "acquiescence under the present government, and forbearing satire on it," adds, "but I can neither take the oaths nor forsake my religion." His conversion to the papacy was announced to the world in 1687 by his 'Hind and Panther,' "an allegory," as Johnson happily expressed it, "intended to comprise and to describe the controversy between the Romanists and the Protestants." It did not, we know, decide nor materially influence the controversy; but it is a brilliant specimen of the poet's almost unrivalled power of reasoning in verse. Whatever may be thought of the arguments, and absurd as is the allegory, the 'Hind and Panther' is certainly of its kind one of the finest pieces in the entire range of English poetry.

In 1690 Dryden returned to his old employment, and produced four plays between that year and 1694. This was no doubt owing to poverty, as the revolution deprived him of the laureateship, which he had obtained on the death of Davenant in 1668, and the expenses of his family were now increasing. For the next three years he was busied in his translation of the 'Æneid,' and about the same time with it appeared his celebrated ode on St. Cecilia's day, which is in its way perhaps one of the finest pieces of exact lyrical poetry which our language possesses.

In the middle of 1698 he undertook his adaptations of Chaucer, and about a year and a half afterwards completed his Fables. His last work—a masque, with prologue and epilogue—was written about three weeks before his death, which happened, after a short illness arising from neglected inflammation of the foot, on the 1st of May 1700. He was buried in Westminster Abbey, where a monument was erected to his memory by John duke of Buckingham. A portrait of him hangs in the hall of Trinity College, Cambridge.

It is extremely difficult to form an opinion on the character of a man of whose life we possess such scanty notice, and who, for the greater part of his literary career, wrote entirely to please others. Congreve has left a description of him, and there seems no reason to distrust it, which ensures for him the praise of modesty, self-respect, true-heartedness, and a forgiving spirit. His manners are said to have been easy without forwardness; but it has been said that his powers of conversation were rather limited. It does not seem necessary that we should attribute his extreme indelicacy as a dramatic writer to corresponding coarseness or impurity as a man. The close connection which existed between the Cavaliers and the court of France had tended much to vitiate the taste of those who were the received judges of literary merit. To the Italian sources, whence Spenser and Milton drew, was preferred the French school; and the consequences are as apparent in the grossness of Dryden's comedies as in the stilted and

extravagance of his heroic drama. Dryden appears to have been very late in discovering that style for which he was most fitted, namely, satire, in which he has never been surpassed, and rarely equalled. His translations of Virgil and Juvenal deserve very high praise, particularly when they are compared with the style of translation usual in his time. In his version of Chaucer he has not been so successful. That substitution of general for particular images which characterises the performance is always a step away from poetry. Perhaps the most striking instance of the superiority of Chaucer is that description of the Temple of Mars which occurs towards the close of the second book of 'Palamon and Arcite' in Dryden, and a little past the middle of Chaucer's 'Knights' Tale.' This passage is also curious as an instance of Dryden's hatred of the clergy; he introduced two lines to convert Chaucer's "smiler with the knife under the cloak" into a priest. In his diction Dryden is thoroughly English, free from affectation, and always perspicuous. His versification is that of a master: no one else has used the heroic measure with such ease and vigour.

Dryden's prose works consist mostly of dedications, the extravagant flattery of which is only palliated by custom, and of prefaces, which are in fact rather essays, and many of them very remarkable ones. His 'Essay on Dramatic Poesy' has been already noticed; that on Painting is a good example alike of the excellences and defects of his prose—of its colloquial ease and rhythm, of its shallowness, loose reasoning, its frequent egotism, and at times somewhat excessive familiarity. He also wrote Lives of Polybius, Lucian, and Plutarch ('Biog. Brit.'). and assisted in translating the last-named author: perhaps, however, only from the French.

(Langbaine, *Dramatic Poets*; Johnson, Malone, Scott, and Bell, *Lives of Dryden*; *Quarterly Review* for 1826; *Edinburgh Review*, 1803; *Life of Sir W. Scott*, vol. ii.)

DUAREN, DOUAREN, or DUARENUS FRANÇOIS, a French lawyer, was born about 1509. His youth was chiefly devoted to literature; and he is said to have acquired the rudiments of his professional education from conversation with M. Budé, Maître des Requêtes at Paris, to whose children he was employed as tutor. He afterwards taught law at Bourges, where in his old age, as defender of the established system of jurisprudential instruction, he carried on a long controversy with Cujacius, then in his youth. This dispute, of a kind so frequently exhibited when a rising genius invades old settled principles, was conducted with so much animation between the factions, headed by these two leaders, that it was compared to a civil war. Cujacius acknowledged that to the exertions he had to make in this controversy he owed much of his subsequent legal knowledge and critical discrimination.

Duaren died at Bourges in 1559. His works were published at Leyden, in 1584, in two volumes folio, and there are subsequent editions. Some of his minor works are published in the 'Tractatus Tractatum.' There is a Memoir of him in Taisand's 'Les Vies des plus célèbres Jurisconsultes.'

DUBOS, JEAN-BAPTISTE, was born at Beauvais in December 1670. He began to study theology, but soon abandoned it for politics. He was employed by M. De Torcy, minister of foreign affairs, on several secret negotiations with the governments of England, Holland, Germany, and Italy. His services were rewarded by a pension and by several benefices. Having retired from his political avocations, he devoted himself entirely to literature. In 1720 he was admitted into the Academy, of which two years later he became secretary for life. He died at Paris in 1742, after a long illness.

The work by which he is chiefly known, 'Réflexions Critiques sur la Poésie et sur la Peinture,' is in its kind, and for its time, excellent. He first inquires into the cause of the fine arts, and discovers it in the love of excitement which is naturally implanted in the human breast: man, he thinks, would rather be unpleasantly excited than not excited at all. He then proceeds to the cause of the pleasure felt in witnessing tragical representations. He observes that, from the before-named love of excitement, people are fond of looking at executions, &c., and concludes that a method should be devised by which we may have the excitement without the subsequent painful reflection that a fellow-creature has been suffering intensely. This end is accomplished by tragedy or a tragical picture, where the suffering, being feigned, leaves behind no feeling of regret. Keeping this principle in view, he goes on to inquire what are the proper subjects for poetry and painting, using as the standard of his judgment the greater or less degree of excitement occasioned by such and such subjects. His discussions whether the hero of a tragedy should be a person of ancient or modern history, on the appropriate use of allegories, and similar topics, are managed in the pleasantest style possible, and are besides, if we make due allowance for the French dramatic prejudices, very instructive, as well for the critical views which they contain as for the historical anecdotes with which they are illustrated. Dubos is also known as an historian by his 'Histoire de la Ligue de Cambrai,' and 'De l'Établissement de la Monarchie Française dans les Gaules,' works which were admired by some of his contemporaries and slighted by others.

DU CANGE, CHARLES DUFRESNE, SEIGNEUR, was born at Amiens, December 18, 1610, in Jesuits' College of which place he was educated. He studied the law, but after a time gave himself up entirely to history and philosophy. His first work was 'Histoire de

l'Empire de Constantinople sous les Empereurs François, folio, 1657; but he is better known for his *'Glossarium ad Scriptores medice et infime Latinitatis'*, 3 vols. folio, afterwards republished in 6 vols. in 1733, to which were added 4 more vols. by Carpentier, a Benedictine of the order of Cluni. It is a most useful work for the understanding of the numerous writers of the dark or middle ages, when for many centuries a corrupt and barbarous Latin was the only literary language of Europe. All the words used by these writers, which are not found in classical Latin, are ranged in alphabetical order, with their various meanings, their etymology, and references to the authorities. This work is also useful for understanding old charters, and other legal documents of an early date. The labour and research required for the compilation of such a work can be best appreciated by those who have frequent occasion to consult it. Du Cange was one of the editors of the *'Corpus Historiæ Byzantinæ'*. He died in 1688. Louis XIV. bestowed a pension of 2000 francs upon his children. [BYZANTINE HISTORIANS.] He wrote also:—1, *'Historia Byzantina illustrata'*, folio, 1680, being an historical description of Constantinople and its monuments, with biographies and genealogies of several distinguished families of that city; 2, *'Glossarium ad Scriptores medice et infime Græcitatæ'*, Paris, 1688, 2 vols. folio, a work that is very necessary for those who are studying the lower Byzantine writers. He left a vast quantity of manuscripts, especially on historical, archaeological, and genealogical subjects, which have been collected in the Imperial Library at Paris, and of which an account is given in the *'Mémoire Historique sur les MSS. de M. Du Cange'*, Paris, 1752. Du Cange is often quoted by the name of Du Fresno, under which he is also registered in many catalogues.

DUCAREL, ANDREW COLTEE, an eminent English antiquary, was born in 1713 in Normandy, whence his father, who was descended from an ancient family at Caen in that province, came to England soon after the birth of his second son James, and resided at Greenwich. In 1729, whilst a scholar at Eton, Ducarel was for three months under the care of Sir Hans Sloane, on account of an accident which deprived him of the sight of one eye. In 1731 he was admitted a gentleman-commoner of St. John's College, Oxford; B.C.L. in 1738; LL.D. in 1742; and became a member of Doctors' Commons in 1743. He was elected commissary of the exempt jurisdiction of the collegiate church of St. Katharine, near the Tower of London, in 1755; and was appointed commissary and official of the city and diocese of Canterbury by Archbishop Herring in 1758. Upon the incorporation of the Society of Antiquaries in 1755, he was appointed one of its first fellows.

Dr. Ducarel's earliest publication (without his name) was a *'A Tour through Normandy, described in a Letter to a Friend'*, published in 1754 in 4to, enlarged and republished in folio in 1767 under the title of *'Anglo-Norman Antiquities, considered in a Tour through part of Normandy, by Dr. Ducarel, illustrated with twenty-seven plates'*. His second publication was *'A Series of above two hundred Anglo-Gallic, or Norman and Aquitain, Coins of the Ancient Kings of England, exhibited in sixteen copper-plates, and illustrated in Twelve Letters, addressed to the Society of Antiquaries of London and several of its Members'*, 4to, London, 1757. In 1760 he printed for private distribution, in 4to, an account of his friend Browne Willis, read at the Society of Antiquaries that year. In 1763 he published *'A Repertory of the Endowments of Vicarages in the Diocese of Canterbury'*, in 4to, which was reprinted with large additions in 8vo in 1782, with the further addition of a repertory of endowments of vicarages in the diocese of Rochester. Dr. Ducarel gave a manuscript abstract of the large history of the Benedictine Abbey of Bec, in Normandy, drawn up by Dom John Bourget, a monk of that house, to Mr. John Nichols, who printed it in 1779 in 8vo, with an appendix of original deeds; and who likewise printed in the same year, in 2 vols. 8vo, *'Some Account of the Alien Priors, and of such lands as they are known to have possessed in England and Wales'*, the chief materials of which were also collected by Dr. Ducarel. The greater part of the materials of the *'Collection of Royal and Noble Wills'*, from the Conqueror to Henry VII., printed by Mr. Nichols in 1780, were likewise furnished by Dr. Ducarel.

In 1782 he published *'The History of the Collegiate Church of St. Katharine, near the Tower of London, from its Foundation in 1273'*. This work had been compiled by the doctor for the use of Queen Charlotte, this church being the only ecclesiastical preferment in the gift of the Queen-Consort of England. An appendix to this work was published in 1790 in No. LII. of Mr. Nichols's *'Bibliotheca Topographica Britannica'*. In 1788 he published, as No. XII. of the *'Bibliotheca Topographica Britannica'*, *'Some Account of the Town, Church, and Archbishoppal Palace of Croydon, in the County of Surrey, from its Foundation to 1783'*, 4to, originally drawn up by him in 1754 at the request of Archbishop Herring. He also drew up in the *'Bibliotheca Topographica Britannica'*, No. XXVII., *'The History and Antiquities of the Archbishoppal Palace of Lambeth, from its Foundation to the Present Time'*, 1785, 4to, dedicated to Archbishop Moore.

Dr. Ducarel's life was one of indefatigable industry. Exclusive of the works already mentioned, the publication of Snelling's plates of English medals originated with him. He wrote in the *'Philosophical Transactions'* upon the subject of trees indigenous to Great Britain, followed by an account of the early cultivation of botany in England.

His letter to Gerard Meerman, grand-pensionary at the Hague, on the dispute concerning Corsellis as the first printer in England, translated into Latin by Dr. Musgrave, with Meerman's answer, was published in the second volume of Meerman's *'Origines Typographicæ'* in 1765. He entered deeply into the Rowlesian controversy, of which he entertained what is now the general opinion. He completed a list of various editions of the Bible and parts thereof, in English, from 1526 to 1776, an improved edition of which was published in 1778 at the expense of Archbishop Cornwallis. His memoirs of Archbishop Hutton and his family, fairly written, were purchased at the sale of his library, by Dr. Lort for the Hutton family. He perfected the catalogues of the different portions of the Lambeth library, and made a general index to all the archiepiscopal registers at Lambeth, from Pecham to Herring, in 48 vols. folio, his own duplicate of which was bought at the sale of the late Mr. Gough's library, for the manuscript department of the British Museum. In addition to all these literary labours, his official attendance to the duties of Doctors' Commons was unremitting. Dr. Ducarel died at his house at South Lambeth on the 29th of May, 1785.

(Nichols, *Literary Anecdotes*, vol. vi. p. 380-404; Chalmers, *Biog. Dict.*, vol. xii. p. 375-385.)

DUCCIO, DI BUONINSEGNA, a celebrated old painter of Siena, and one of the earliest of the Italian painters, was born in or near Siena, in the latter half of the 13th century. He signed himself Duccius, or Magr. Duccius; Buoninsegna, or Segna, was the name of his master or father, who was still living in 1303. There are some of his works in the Siena Academy.

Duccio was to the school of Siena what Cimabue was to that of Florence. His active career was probably between 1285 and about 1315; he is mentioned in the Siena archives of 1285, when he may have been about twenty-five or thirty years of age; and he is mentioned also as late as 1311, when he completed his great work, the celebrated altarpiece of the cathedral, which he commenced in October 1308. This picture was the most extensive production of its class in its time, and cost, including gold and ultramarine, about 3000 florins, an immense sum. Duccio's share however was small, though probably not an illiberal one: it was only sixteen pence or soldi per day, but at this time ten soldi would buy a picture. The picture was on a pannel made of poplar and chestnut, covered over with canvas which was primed with plaster. It was carried in procession to the cathedral, and placed on the high-altar with great ceremony. As the altar was free on all sides, Duccio painted the altarpieces on both sides: on the principal side, or that facing the people, are represented in large figures the Madonna and child, surrounded by saints and angels and the four patrons of Siena; on the other side is a series of small pictures illustrating the history of the passion of Christ, in figures about six inches high, all executed with great skill and surprising care, but in the Byzantine style of design. It was removed from the altar in the early part of the 16th century to give place to a tabernacle, and was afterwards cut in two: the halves were placed in the choir, where they still remain.

There are other works by Duccio extant, but Rumohr has shown Vasari's statement respecting him and the pavement of the cathedral of Siena to be incorrect. The first mention of the pavement in the archives is in 1445, more than a century after the death of Duccio. Vasari states that Duccio was the artist of some of the decorations of the pavement, and was the inventor of the peculiar style in which the figures are executed, which he terms gray-in-gray. But these figures are in various styles—some in a species of niello, and others in a kind of mosaic; and they were executed at different periods by various artists, and all apparently subsequently to 1445. (Rumohr, *Italian Researches*, vol. ii., p. 4, et seq.) Titius, vicar-general of Siena, and Duccio's contemporary, says of him, that as many painters proceeded from his studio as the warriors who of old descended out of the Trojan horse. The year of his death is not known; Della Valle supposes he died about 1340; Rumohr places his death upwards of twenty years earlier.

(Von Rumohr, *Italianische Forschungen*; Vasari, *Vite de' Pittori*, &c., ed. Schorn; Della Valle, *Lettere Sanesi*, il. 75, 76; Lanzi, *Storia Pittorica*, &c.)

DUCHANGE, GASPARD, an able French etcher and engraver, was born at Paris in 1662. He was the pupil of Jean Audran, and was one of the best historical and portrait engravers of his period. He was, according to Watelet, the best of all engravers in representing female flesh. Three of his most celebrated works were the Io, Danaë, and Leda of Correggio, of which he afterwards destroyed the plates on account of their indelicacy. He engraved until his ninety-first year, and his works are consequently numerous. He died at Paris in 1756, aged ninety-four. (Watelet, *Dictionnaire des Arts*, &c.; Huber, *Manuel des Amateurs*, &c.)

DUCHESSNE, ANDRÉ, a French historian, was born in 1584 at Isle-Bouchard, a small town in the department of Indre-et-Loire. He commenced his studies at Loudun, and completed them at Paris under Jules-César Boulanger. He applied himself especially to geography and history, and became so greatly distinguished for his acquisitions in these two departments of knowledge as to obtain the patronage of Cardinal Richelieu and other noblemen of influence, and to be appointed successively geographer and historiographer to the king. He died in

1640, in consequence of having been crushed by a carriage when travelling from Paris to his country-residence.

Duchêne was a writer of considerable erudition and of the most laborious research in various departments of history. His works are so numerous and of such importance as to have acquired for him, perhaps not unfairly, the title of the 'Father of French History.' Among the more important of his publications may be mentioned the following:—*'Historiæ Francorum Scriptores Coetanei,'* 5 vols. folio, 1636, &c.; *'Historiæ Normannorum Scriptores Antiqui,'* folio, Paris, 1619; *'Histoire des Rois, Ducs, et Comtes de Bourgogne depuis 408 jusqu'en 1350,'* 4 vols. 4to, Paris, 1628; 7 vols. folio of Genealogical Histories of various Families of French Nobility. Among his earlier works is a translation of the 'Satires' of Juvenal, with notes, which is now very scarce, 'Satires de Juvenal, traduites en François, avec des Notes,' 8vo, Paris, 1616. He appears also to have edited the first edition of the works of Abelard and Eloïse, though many copies have the name of François d'Amboise in place of that of André Duchêne, 'Petri Abelardi et Heloise Conjugis ejus Opera, nunc primum edita ex MSS. Codd.,' 4to, Paris, 1616. [ABELARD.] Nieéron makes the following remarks on this extraordinary fact:—"If it may be allowed to make a conjecture, one might believe that from some secret motive which it has not been thought proper to transmit to posterity, Duchêne may have relinquished the glory of his work to D'Amboise, who was then in a situation to recompense a sacrifice of this nature."

FRANÇOIS DUCHÊNE, son of André, who was born in 1616 and died in 1693, completed and published several of the works of his father, among which is the *'Histoire des Chanceliers et Gardes des Sceaux de France,'* folio, 1680.

(*Nouvelle Biographie Générale.*)

DUCIS, JEAN-FRANÇOIS, was born at Versailles in 1732, and became a dramatic writer somewhat late in life. His first pieces made but little impression, and it was not until he had produced a version of Shakspeare's 'Hamlet' that his name began to acquire some celebrity. 'Romeo and Juliet,' the second tragedy from Shakspeare, had great success. But Ducis has so altered the works of our great author, that were it not for the name we should with difficulty discover any connection between the original and the version. He subsequently tried to imitate the Greek drama in a tragedy called 'Œdipus with Admetus;' but he soon returned to Shakspeare, and produced, among other pieces, 'Macbeth,' 'Othello,' and 'Lear.' In 1778 he was called to the Academy to fill the vacancy left by Voltaire. He afterwards became secretary to Louis XVIII., and was ever most devotedly attached to him. Even when almost starving, he refused a pension of 40,000 francs and the cross of the legion of honour, which were offered him by Napoleon. The restoration of his beloved king rendered his old age happy. At his first audience the king recited to him some of his own verses: "I am more fortunate," cried the old poet in ecstasy, "than Boileau or Racine; they recited their verses to Louis XIV., but my king recites my verses to me." He died in 1816.

DUCKWORTH, ADMIRAL SIR JOHN THOMAS, Bart., G.C.B., was a son of the Rev. H. Duckworth, rector of Fulmer, Bucks, and was born in February 1748. His family was anciently settled in Devonshire. He was sent to Eton at an early age, and entered the navy in 1759 under Admiral Boscawen, on board the 'Namur,' and in the same year took part in two naval engagements with the French admirals De la Clue and De Conflans. After serving in several ships, in 1776 he went to America as lieutenant of the 'Diamond,' and continued there for three years, when he was appointed to the 'Princess Royal,' and subsequently served on the West India station. In 1793 he was attached to Lord Howe's fleet, and is mentioned with great praise in that admiral's despatches for the part he took in the action of the 1st of June 1794, as having displayed not only great bravery but great skill in naval tactics. Having again served on the West India and Channel stations, he reduced Minorca in 1798 without the loss of a single man. In 1800 he was appointed to the command of the Leeward Isles, and in 1801 having taken part in the reduction of the Danish and Swedish West India islands, was created a K.C.B. In 1803 he was commander-in-chief at Jamaica, and blockaded the harbours of the island of St. Domingo. His success in protecting the commerce and the coasts of Jamaica was acknowledged by the House of Assembly of Jamaica, who presented him with a sword of 1000*l.* value. In 1805, relinquishing the blockade of Cadiz in which he was engaged, he defeated the French in the bay of St. Domingo, for which he received the thanks of both Houses of Parliament and an annuity of 1000*l.* Having been sent out to watch the Turkish fleet, in February 1807, he forced the passage of the Dardanelles, an enterprise at once most successful and unexampled, and also most important in its consequences. From 1810 to 1815 he was governor and commander-in-chief of Newfoundland, when he was recalled to England and appointed governor of Plymouth. He was created a baronet in 1813, and died at Plymouth Dock, now called Devonport, August 31st, 1817.

DUCLOS, CHARLES-PINEAU, was born in the year 1704, at Dinant, in Bretagne, whence he was sent to Paris to prosecute his studies. He soon formed a connection with the wits of the age, and published a Romance called 'Acájon et Zirphile.' This work attained only moderate celebrity; but a subsequent romance, entitled 'Con-

fessions du Comte de * * *,' was more successful. His reputation however depends on a collection of moral essays, published under the title of 'Considérations sur les Mœurs de ce Siècle,' which have been greatly extolled by many writers, and which Louis XV. characterised as "the work of an honest man." In 1739 Duclos was admitted into the Academy of Inscriptions, and in 1747 into the Académie Française, of which he became perpetual secretary. The citizens of his native town, to testify their respect for him, made him their mayor in 1744, but he continued to reside at Paris, where he died in 1772.

The romances of Duclos, though less indecent than the works of Crébillon the younger, are sufficiently indelicate to offend persons of refined taste, while they lack the bitter satire and deep knowledge of human nature which characterise that acute though obscene author. His 'Considérations' are a series of essays on the opinions which regulate society, and though free from the misanthropic ill-nature which appears in Rochefoucauld and occasionally in La Bruyère, they are deficient in the real depth which those writers exhibit, and want that charm of novelty and originality which is necessary to make mere moral essays palatable. The romances and essays have been collected into four vols., 8vo, under the title of 'Œuvres Morales et Galantes.' Duclos also wrote a history of Louis XI., and a secret history of Louis XIV. and XV., which have acquired some reputation.

* DUDEVANT, MADAME AMANTINE-AURORE, better known by her assumed name of *George Sand*, was born in 1804, in the department of Indre (part of the old province of Berri), in the very centre of France. Her father, Maurice Dupin, was a captain in the army of the empire, after having served since 1793 in the wars of the revolution. His father was a fermier-général; but his mother, who had been previously married to Count de Horn, was the only daughter of the celebrated Mareschal Maurice de Saxe, who was a natural son of the handsome Augustus II. of Poland. Thus the future authoress, by her paternal descent, had the royal blood of Poland in her veins—a fact which, with the mixture of that blood through her mother with blood more plebeian and popular, she herself commemorates. Left an orphan by the death of her father, who was killed by a fall from his horse, Mademoiselle Dupin was educated under the care of her grandmother, the Comtesse de Horn, who still survived, at the Château de Nohant, in a retired valley in her native province of Berri. As her grandmother (a genuine Frenchwoman of the revolution) was a believer in the doctrines of Rousseau, the education of the young Aurore was somewhat peculiar. She roamed about as she chose, and was brought up very much as if she had been a boy. Already however her intellectual tastes had declared themselves, and she was an ardent and a voracious reader. At the age of fifteen, her grandmother, persuaded at last that a girl educated on Rousseau's system in the country would be an anachronism in the France of the restoration, sent her to Paris, where she was placed in the Convent des Dames Anglaises. Here, with all the enthusiasm of her nature, she entered into the spirit of the place, so totally novel to her at the time, and became an ardent Catholic. Her devoteism went so far that, on her grandmother's death, she determined to take the veil. The remonstrances of her family, if not their authority, prevented her from carrying the design into effect; and at the age of seventeen she was married, by family arrangement, to M. Dudevant, a country gentleman of Berri, to whom she brought some fortune. She lived with him about ten years, during which they had two children, a son and a daughter. But, although there was no disparity of years or other ordinary cause of incompatibility between the husband and the wife, the marriage was not a suitable one; and Madame Dudevant having, in consequence of a severe illness, been sent to the Pyrenees for change of air, and having then, for the first time since her girlhood, come into free contact with the world, conceived such a distaste for her existing mode of life that she resolved to bring it to a close. Accordingly, she separated from her husband in 1831, allowing him to retain her fortune, and came to Paris, to begin, at the age of twenty-seven, a life of absolute independence. She resided first at the convent where she had been educated, but afterwards in an obscure lodging in the Quai-St-Michel, where Jules Sandeau, a young student with whom she had some time before become acquainted, also had his abode. In order to earn a mere subsistence, the two friends, so associated, betook themselves to literature; and, after some contributions to 'Figaro,' a journal of that day, they jointly wrote a novel called 'Rose et Blanche,' which was published (1832) with 'Jules Sand' on the title-page as the author's name. The proceeds of this work enabled the friends to live for some time; but again, on the compulsion of necessity, they agreed, during a separation caused by Madame Dudevant's return on business to Berri, to write each a portion of a tale to be published as one. Madame Dudevant alone executed her part of the work, and the result was 'Indiana,' which was published in 1832, and to which, in commemoration of her friendship with Sandeau, she affixed the name of 'George Sand.' This work at once made her celebrated, and her celebrity was increased by her next tales—'Valentine,' published in the 'Revue de Paris' (1832); and 'Zelia,' published in the 'Revue des Deux Mondes' (1833). The genius of these works was acknowledged by all, while the daring spirit of social revolt which they showed, and especially their doctrines as to the institution of marriage, gave a peculiarity to their reputation which much affected their reception as specimens of literary art. The same admiration of the

genius of the authoress, as shown in her powers of description, narration, and character-painting, and in her almost unmatched mastery of eloquent French prose, accompanied by the same force of the influence of her doctrines on the minds of the young, has attended her throughout her whole subsequent career—except that of late the admiration has become more general, and the fear has considerably abated. Her works have been extremely numerous. In addition to those already mentioned, more than a dozen novels—among which were 'Le Secrétaire Intime,' 'André,' 'Leone-Leoni,' 'Jacques,' 'Mauprat,' and 'Spiridion'—proceeded from her ready pen before 1837, published generally first in the *feuilletons* of journals. About this time she was successful in a suit against her husband instituted for the recovery of her private property, and for obtaining the guardianship of her children. With her children she removed to the Château de Nohant, where she has chiefly resided since, often however removing to Paris. When M. Pierre Leroux and others started the 'Revue Indépendante,' she became a contributor to that periodical, and here appeared perhaps her finest tale, 'Cousuelo.' She also contributed to 'Le Monde,' a journal edited by Lamennais. Among her novels, besides 'Cousuelo,' published since 1837, are 'Horace,' 'La Petite Fadette,' 'Jeanne,' 'Fauchette,' and 'La Comtesse de Rudolstadt,' but her tales in all amount to about thirty, and while there is not one of them that does not display genius, hardly any two of them are precisely alike. In 1841 she published 'Un Hiver au Midi,' commemorating a residence in the island of Majorca. Prepared by long association with Lamennais, Pierre Leroux, and other distinguished thinkers characterised by faith in philosophic democracy, and in the possibility of reorganising society on new religious and political principles, Madame Dudevant entered with enthusiasm into the sanguine hopes of a new era for France which were produced by the revolution of 1848. For some time she edited a democratic newspaper of her own, in which she addressed the people in this express character of a journalist from day to day. The regime of Louis Napoleon, first as president and next as emperor, having repressed democratic politics in France, Madame Sand, while still retaining her political beliefs and aspirations, was obliged to resume her more purely literary labours. Within the last few years, residing either at Nohant or at Paris, where her daughter is married, she has, to a great extent, forsaken the novel for the drama. Here she has not been so successful as in the novel, some of her pieces having failed. Her late pieces however have been popular on the stage. She has recently published a voluminous autobiography, which appeared in parts in the 'Presse' newspaper. Many of her works have been translated into English.

* DUFF, ALEXANDER, D.D., LL.D., the chief agent of the Free Presbyterian Mission in Calcutta, was born in 1808, at Pitlochry, in Perthshire, and prosecuted his studies for the Christian ministry at St. Andrews University. Having been early impressed with a sense of the importance of missions to heathen lands, he was the more easily persuaded to go out to India as a missionary of the Church of Scotland. After a stormy and protracted voyage, in which the vessel in which he set sail from Portsmouth, was shipwrecked near Cape Town, and the passengers and crew barely escaped with their lives, Mr. Duff arrived in May 1830 at the scene of his labours. From that time till the disruption of the established church of Scotland in 1843, he continued with unremitting earnestness and zeal to promote the moral and spiritual welfare of the people of India, visiting his native country once during this period for the purpose of giving information and exciting a deeper interest throughout the churches at home in favour of Indian missions. An address which he delivered in the General Assembly in 1835 was published separately, under the title of 'The Church of Scotland's India Mission;' another address to the same venerable body in 1837 appeared under the title of a 'Vindication of the Church of Scotland's India Mission;' a speech on the same subject delivered in Exeter Hall in 1837 was likewise published. About the same time Mr. Duff received the degree of D.D. in acknowledgment of his valuable labours in the East. Dr. Duff did not confine his views exclusively to the more direct object of his mission to India, but took much pains to promote general education, and particularly a knowledge of the English language and literature among the natives of Hindustan. To this subject he in 1837 directed the attention of those persons in Britain who took an interest in the civilisation of British India, in a work entitled 'New Era of the English Language and Literature in India.' In 1839, previous to his return to resume his important duties, Dr. Duff published a thick 8vo volume on 'India and India Missions;' a discourse entitled 'Missions the chief end of the Christian Church,' and a treatise on the 'Qualifications, Duties, and Trials of an Indian Missionary.' When the Free Church was formed in Scotland in 1843, and the foreign missionaries of the Church of Scotland found it necessary to make their choice as to which of the two bodies they would be connected with, Dr. Duff chose to be associated with the Free Church, and succeeded in establishing and carrying on with increased efficiency new educational and religious institutions for the benefit of the native population. Schools attended by hundreds of pupils, asylums for orphans, colleges for the more intelligent Hindoo youths, and other similar schemes have been brought by his zeal into successful operation. Several native students have been trained for the Christian ministry, and are now preaching the doctrines of Christianity to their Indian brethren. Dr. Duff had the

principal part in establishing a quarterly periodical, conducted with great ability, entitled the 'Calcutta Review.' After a visit to his native country for the benefit of his health, and to promote the interests of the mission, Dr. Duff has again returned to his favourite field of exertion. While in Scotland, he was chosen Moderator or President of the General Assembly of the Free Church, which met at Edinburgh in May 1851.

DUFRESNE, [DUCANGE.]

DUFRESNOY, CHARLES ALPHONSE, was born at Paris in 1811. His father, who was an apothecary, gave him a classical education, with a view to bringing him up as a physician; but he gave way to his strong inclination for painting, and he devoted himself to the study of the art, first under Perier, and afterwards with Vernet. At the age of one-and-twenty he went to Rome, where he supported himself with difficulty by taking views of ruins and buildings. Subsequently he was employed with his fellow-student, Mignard, to copy pictures in the Farnese gallery. Dufresnoy afterwards visited Venice, where he remained there engaged in copying and examining the works of the great Venetian painters. He returned to France in 1833, whither he was followed by Mignard in 1862, and they again lodged together. He died paralytic in 1865, in the house of his brother, at Villiers-le-Bel, near Paris. He was never married, and left no pupils. He executed very few pictures, and they are not remarkable for anything beyond correctness. He is best known as the author of a didactic poem, 'De Arte Graphica,' in Latin verse, which has been translated into several languages. There are three English translations: by Dryden, in prose; by Wills, a painter, in very poor verse; and by Mason, in rhyme. The last is accompanied by annotations written by Sir Joshua Reynolds. The work is rather a critical treatise on the practice of painting, with general advice to the student, than a manual for the art. It is dry, and not remarkable for elegance, imagination, or originality. Had it been in prose, it would probably not have survived the author; but the circumstance of its being in verse, and in Latin, perhaps added a zest to its perusal in the shape of a little difficulty, and gave it an extrinsic importance. Sir Joshua's notes are pertinent and useful, but not so instructive as his lectures.

DUGDALE, SIR WILLIAM, was the only son of John Dugdale, Esq., of Shustoke, in the county of Warwick, where he was born September 12, 1605. His mother was Elizabeth, daughter of Arthur Swynfen, Esq., of Staffordshire. He was in part educated in the free school at Coventry, and subsequently with his father, with whom he also read 'Littleton's Tenures,' some other law-books, and history. In 1622 he married Margery, the second daughter of John Huntbach, Esq., of Seawall, in Staffordshire. Upon his father's death in 1624, he succeeded to a small estate in Shustoke, to which he added by purchase the manor of Blythe, in that parish, in 1625.

Dugdale's natural inclination, which was chiefly the study of antiquities, brought him acquainted with the most eminent antiquaries of his day. Sir Symon Archer, of Tamworth, introduced him to Sir Christopher Hatton and Sir Henry Spelman, by whose joint interest with the Earl of Arundel, then Earl Marshal, he was created a pursuivant-at-arms extraordinary, by the name of Blanche Lyon, in September 1638. Afterwards he was made Rouge Croix pursuivant in ordinary, by letters patent dated March 18, 1639-40; by which means, having lodging in the Herald's College, and convenient opportunities, he made large collections from the Records in the Tower of London, as well as from other places.

In 1641, by Sir Christopher Hatton's encouragement, he superintended the making of exact drafts of all the monuments in Westminster Abbey, St. Paul's Cathedral, and in many other cathedral and parochial churches of England; particularly those at Peterborough, Ely, Norwich, Lincoln, Newark-upon-Trent, Beverley, Southwark, Kingston-upon-Hull, York, Selby, Chester, Lichfield, Tamworth, Warwick, &c. The drawings were made by one William Sedgewick, an arms-painter, then a servant of Sir Christopher Hatton; the inscriptions were copied by Dugdale. Both were deposited in Sir Christopher Hatton's library, that the memory of these monuments might at least be preserved; the state of the times threatening imminent destruction to the originals.

In June 1642 the king, who had retired to York, summoned Mr. Dugdale to attend upon him, according to the duty of his office. Dugdale accordingly repaired to York, and was afterwards commanded to attend the Earl of Northampton, who was marching into Worcestershire to oppose the forces raised by Lord Brooke for the service of the parliament. He attended upon the king at the battle of Edgehill, and afterwards at Oxford, where he continued with his majesty till the surrender of the garrison there to the parliament, June 22, 1646. He was created M.A. November 1, 1642; and April 16, 1644, was promoted to the office of Chester-herald. During his long residence at Oxford, he applied himself to such researches in the Bodleian, and the different college libraries, as he thought might conduce toward the furtherance of the 'Monasticon,' then designed by Roger Dodsworth and himself; as well as to the history of the ancient nobility of the realm, and of which he afterwards made much use in his 'Baronage.'

After the surrender of Oxford upon articles, Dugdale, having the benefit of them, and having compounded for his estate, went to London; where he and Dodsworth proceeded vigorously in completing

their collections from the Tower Records and Cottonian library. A short absence from England in 1648, when he attended Lord and Lady Hatton to Paris, enabled him to improve his and Dodsworth's collections with notices and charters relating to the Alien Priorities of England, from the papers of Andrew Duchesne. When their collections were ready, the booksellers declining to venture upon so large and hazardous a work, Dodsworth and Dugdale printed the first volume at their own charge, and it was published in 1655, in folio, under the title of 'Monasticon Anglicanum,' adorned with the views of abbays, churches, &c. The second volume was published in folio, in 1661. These two volumes were collected, and chiefly written by Dodsworth; but Dugdale took great pains in methodising and disposing the materials, in making several indexes to them, and in correcting the press. Dodsworth died in August 1654, before the tenth part of the first volume was printed off. A third volume was published in 1673.

From an entry in his diary, as early as 1658, Dugdale appears to have feared that a translation of the 'Monasticon' would have been published by Mr. King, probably Gregory King, at that time his clerk. That such a one was prepared, as far as the first volume was concerned, is evident, since Dugdale describes it as "erroneously Englished in a multitude of places." The translation however, or rather the epitome which was subsequently printed, did not appear till 1692, six years after Sir William Dugdale's death. The dedication to William Bromley, Esq., is signed J.W. It is ascribed to James Wright, who, in 1684, published the 'History and Antiquities of the County of Rutland.' Another epitome, by an anonymous writer, was published in 1718: but believed to have been by Captain John Stevens, who, in 1722 and 1723, published two additional volumes to the 'Monasticon,' which, besides an abundance of additional information in English, contained a very large collection of new charters, together with the 'History of the Friaries,' to which no place had been assigned in the volumes published by Dugdale. The Rev. Samuel Peck, in 1735, promised a fourth volume of the 'Monasticon,' which was never completed. His collections for it are in the British Museum.

An improved edition of the 'Monasticon' was undertaken in 1812 by the Rev. Bulkeley Bandinel, D.D., keeper of the Bodleian library at Oxford, who soon relinquished his task to two other gentlemen who had been called in as coadjutors, John Caley, Esq., of the Augmentation Office, and Henry Ellis, Esq., keeper of the manuscripts in the British Museum (now Sir Henry Ellis). An account of each religious house, in English, was prefixed to its respective series of Latin charters, and many new materials from leiger books, rolls, and other documents were added, including all that was valuable in Stevens's volumes, with the history of several hundred religious foundations which were unknown to Dugdale. The chief of the prints, by Hollar, which ornamented the original edition, were re-engraved, and above 200 plates of churches and monasteries added, from drawings made exclusively for the work. This new edition was completed in 1830 in six volumes folio, the last volume divided into three parts.

In 1656 Dugdale published, at his own charge, 'The Antiquities of Warwickshire, illustrated from Records, Leiger-Books, Manuscripts, Charters, Evidences, Tombes, and Armes, beautified with Maps, Prospects, and Portraitsures,' folio, London: this is one of the very best of our county histories. A second edition was published, in two volumes folio, in 1730, revised and augmented by William Thomas, D.D. While this work was printing, Dugdale remained in London, during which time he had an opportunity of collecting materials for another work, which he published in 1658, 'The History of St. Paul's Cathedral,' in London, folio. A second edition of this work, enlarged, was published in 1716, in folio, by Edward Maynard, D.D., rector of Bodington in Northamptonshire; and a third, in 1818, by Henry Ellis, Esq. The plates of the original editions, both of the 'Warwickshire' and the 'St. Paul's,' were by Hollar. To the two last editions of the 'St. Paul's' a life of Dugdale was prefixed.

Upon the restoration of King Charles II., through Lord Chancellor Hyde's recommendation Dugdale was advanced to the office of Norroy King of Arms. In 1662 he published 'The History of Imbanking and Draying of divers Fens and Marshes, both in Foreign Parts and in this Kingdom, and of the Improvements thereby,' folio, London, 1662; a second edition of which, revised and corrected by Charles Nelson Cole, Esq., appeared in folio, London, 1772. This work was written at the desire of the Lord Gorges, Sir John Marsham, and others, who were adventurers in draining the great level which extends itself into a considerable part of the counties of Cambridge, Huntingdon, Northampton, Norfolk, and Suffolk. About the same time Dugdale completed the second volume of Sir Henry Spelman's 'Concilia,' which was published in 1664 under the title of 'Concilia, Decreta, Leges, Constitutiones in Re Ecclesiasticam Orbis Britannici, &c., ab Introitu Normannorum, A.D. 1066, ad Exutum Papam, A.D. 1531. Accesserunt etiam alla ad Rem Ecclesiasticam spectantia,' folio. Archbishop Sheldon and Lord Clarendon, who were the great encouragers of this labour, likewise employed Dugdale to publish the second part of Sir Henry Spelman's 'Glossary.' Having revised the first part, which had been published in 1626, and arranged the materials of the second, both were printed together in 1664 under the title of 'Glossarium Archaeologicum, continens Latino-barbara, Peregrina, Obsolete,

et Nova Significationis Vocabula.' The second part, digested by Dugdale, began with the letter M. There was another edition of this work in 1887.

In 1666 he published, in folio, 'Origines Juridicales; or, Historical Memoirs of the English Laws, Courts of Justice, Forms of Trial, Punishment in Cases Criminal, Law Writers,' &c., &c., with portraits of several of the judges, and some other plates. A second edition was published in 1671, and a third in 1680. The first volume of 'The Baronage of England' appeared in 1675, and the second and third in 1676, folio. Upon this work he had spent thirty years of labour; and though the corrections to be made in it are numerous, it still remains one of the best works which exist as a foundation of English history.

In May 1677 Dugdale was created Garter King of Arms, and the day after received from his Majesty the honour of knighthood, much against his will, on account of the smallness of his estate. In 1681 he published 'A short View of the late Troubles in England, briefly setting forth their Rise, Growth, and Tragical Conclusion,' folio. This is the least valued of his publications. He published also, at the same time, 'The Antient Usage in bearing of such Ensigns of Honour as are commonly called Arms,' &c., 8vo, a second edition of which, with large additions, was published in the beginning of the year following; and a third edited by T. C. Banks, Esq., folio, London, 1811.

The last work which Dugdale published was 'A perfect Copy of all Summons of the Nobility to the Great Councils and Parliaments of this Realm, from the 49th of King Henry III. until these present Times,' folio, London, 1685. A fac-simile, with the original date of this work, was printed at Birmingham towards the close of the last century.

This industrious man died at Blythe Hall on the 10th of February, 1686, in his eighty-first year, in consequence of a cold, and was interred at Shustoke. His epitaph in Latin, written by himself, is inscribed upon a tablet near the spot of his interment.

An account of Dugdale's manuscript collections remaining in the Ashmolean Museum at Oxford, and in the possession of his descendant, the late Dugdale Stratford Dugdale, Esq., at Merevale in Warwickshire, will be found appended to his 'Life, Diary, and Correspondence,' edited by William Hamper, Esq., 4to, London, 1827, whence the principal particulars of the present life have been obtained. See also the 'Life' prefixed to the last edition of the 'History of St. Paul's;' and Chalmers's 'Biographical Dictionary,' vol. xii. pp. 420-427.

DUKER, CHARLES ANDREW, a distinguished scholar, born at Unna in La Marck, in 1670. He studied first at Hammon, and afterwards, under Perizonius, at Franeker. About 1700 he became professor of history and eloquence at Herborn, in Nassau, which he exchanged, four or five years afterwards, for the place of under-master in the school at the Hague. On the death of Perizonius in 1716, the Greek chair in the university of Leyden became vacant, and was offered to Burmann, who accepted it, and thereby vacated the professorship of history and eloquence which he held at Utrecht, and which was divided between Duker and Drakenborch, Burmann's pupil and friend. In 1734 Duker gave up his professorship and retired to the country. He died at Meyderic on the 5th of November 1752. Duker is best known by his edition of Thucydides, published at Amsterdam in 1731, folio, which was, till Bekker's appeared in 1821, by far the best edition of that author. The great care and labour which he bestowed upon this work made Schröder ('Præf. ad Senec. Tragedias') call him 'Varilectionarius Thucydideus.' Duker also edited Florus in 1722, and contributed to the edition of Livy published by his colleague Drakenborch, to the 'Origines Babylonice et Egyptiacæ' of his friend Perizonius, and to other works. All his notes are sensible and accurate; but it has been remarked that in his 'Thucydides' in particular he has been rather capricious in choosing passages for illustration, and has omitted explanations in the very places where they were most necessary: in this however it must be confessed he is by no means alone among commentators.

DUMAS, ALEXANDRE, was born at Villers-Cotterets, in the department of the Aisne, July 24, 1802. His father, who died in 1806, was a general of some distinction in the republican armies, one of which he commanded in 1794. The future author of eighty dramas and forty fictions received his education in his native town from the pastor, an Abbé Grégainé. This instruction seems, by the account given in his 'Mémoires,' to have been somewhat imperfect, including however a little Latin and a faint notion of history. But the youth delighted in every kind of open-air exercise, and laid in a stock of health and strength for which he was afterwards remarkable. He became a good wrestler and fencer, a first-rate shot, and a keen sportsman. At the age of fifteen he was placed as copying-clerk with a notary named Menesson, who had settled at Villers-Cotterets; he remained with him above eighteen months, and afterwards went to another office of the same kind in another town. He does not appear to have had any early taste for literature, nor to have given any signs of precocious talents. His initiation to the author's craft was accidental. In 1820 a young gentleman from Paris, Adolphe de Leuven, who had begun to write for the theatre, proposed to him to unite their efforts, with this observation, "that to write for the theatre was a trade like any other, and only required practice."

Two years were thus spent. Several plays were written conjointly by the two friends, sent to Paris, and rejected by the managers. But the pressure of family circumstances rendered it necessary that some

plan of life should be adopted. In 1822, at the age of twenty, Dumas found himself without any profession, with an aged invalid mother and a sister to provide for. His father's rank in the army had not secured any fortune to the family, because he had retained his republican principles, and quarrelled with the emperor; but General Dumas had been the fellow-soldier of surviving generals and marshals, and he had left behind him papers and documents in proof of that affinity. Furnished with these papers, and with several letters of recommendation, the youthful aspirant went up to Paris, in the month of March 1822, to seek his fortune. The passage in his autobiography relating to this period is extremely interesting. One of the letters of introduction was to General Foy, who at once took him by the hand, and obtained an appointment for him as supernumerary clerk at the Palais Royal, on the establishment of the Duke of Orleans, with a salary of 1200 francs.

Dumas continued eight years in the service of the Duke of Orleans, and availed himself of his more settled fortune to complete his education by self-culture. The fine library in the palace was open to him, and he read a great deal, and made notes. He laboured at his leisure hours in constructing dramatic pieces, and he attended the theatre to study scenic effects. The first play of Dumas's which was represented was 'La Chasse et l'Amour,' produced at the Ambigu in 1825. He is said to have had two assistants in composing it, M. de Leuven and M. Rousseau. His receipts at that period were so small that, during the seven years preceding his first success in 1829, they did not exceed 30*l.* a year. Yet with this income of less than 80*l.* (including his office salary), he maintained his mother and sister for many years, and was perfectly contented and happy.

The arrival in Paris of Mr. Abbott with a company of English actors in 1827, and the performance of Shakspeare's plays, gave a new turn to his fortune. Dumas saw Macready in 'Hamlet,' and immediately conceived a new world of ideas. He wrote two tragedies, 'Christine' and 'Henri III.'; he wrote them entirely himself. When they were finished, he submitted them to Charles Nodier, who recommended them to Baron Taylor of the Théâtre-Français. 'Henri III.' was the first to appear; it was produced with great success, February 11, 1829, the author's receipts exceeding 1200*l.* during the first season, and extending since then to 100,000 francs. The Duke of Orleans, at the writer's request, attended with a large party of friends. This dramatic triumph was the first victory obtained by the new romantic school over the classic, and was the chief topic of conversation in all public resorts. But it was denounced by the critics as a dangerous innovation. 'Christine' was brought out at the Odéon, March 30, 1830, and was likewise successful. 'Charles VII.' another tragedy, appeared at the same house, October 20, 1831. 'Richard D'Arlington' was performed for the first time at the Odéon, December 10, 1831. The two last are understood to have been written by his assistants, but were carefully revised by himself. His great facility in constructing a plot, and conducting the intrigue, as the French call the development of a piece, afforded him unusual resources, and rendered him impatient of minor labour. His knowledge of stage-effect enabled him afterwards to make organic changes in the work of his ablest collaborateurs. The same may be said of his romances, in which all the artifices of the drama are constantly obvious. His tragedy of 'Antony' was rejected at the Théâtre-Français, and was transferred to the Porte-Saint-Martin, where it was produced, May 3, 1831, with extraordinary success. 'Napoleon Bonaparte,' a six-act drama, was produced at the Odéon, January 10, 1831; 'Terres,' a drama, at the Ambigu, February 6, 1832; 'Le Mari de la Veuve,' a comedy, at the Théâtre-Français, April 14, 1832. 'La Tour de Neale,' written by Gaillardet, and corrected by Dumas, was produced at the Porte-Saint-Martin, May 29, 1832. It led to a literary controversy, and afterwards to a duel between the authors. The principal of his subsequent plays, for which alone we can find room, are the following:—'Kean,' a comedy, at the Variétés, August 31, 1836; 'Mademoiselle de Belle-Ile,' written conjointly with Count Walewski, at the Théâtre-Français, April 2, 1839; 'Les Demoiselles de Saint-Cyr,' at the same, July 26, 1843; 'Les Mousquetaires,' at the Ambigu, October 27, 1845; 'La Reine Margot,' at the Théâtre-Historique in 1848; 'Benvenuto Cellini,' at the Porte-Saint-Martin, 1850; and 'L'Orestie,' a tragedy, altered from Eschylus, represented at the Porte-Saint-Martin, January 5, 1856. Dumas has likewise published a series of sketchy travels, under the title of 'Impressions de Voyages.'

Dumas's list of romances is very long, and two of these, 'Les Trois Mousquetaires' and 'Le Comte de Monte-Christo,' so far excel his dramatic works as to give a very different character to his literary reputation. The extreme fertility of Dumas has led to the general opinion that he produces his extensive works with the aid of assistants, as a great painter sometimes employs other artists for drapery and background, and even for minor groups and simple figures. 'Les Trois Mousquetaires' and 'Monte-Christo,' forming together twenty volumes, appeared both in 1844, but the volumes in that year bearing his name amount to sixty. He is reported to have received the sum of one million of francs during that year, including his rights of authorship on his former theatrical pieces.

Dumas began to publish his 'Mémoires' in 1852, and about twenty-seven volumes had appeared in March 1856. Taken collectively the catalogue of his writings is scarcely conceivable for its extent: he

already speaks of his 1200 volumes. All his writings have the taint of that low standard of morals which renders them unsuited to our English notions.

* DUMAS, ALEXANDRE, the son of the preceding, was born in Paris, July 28, 1824. He has already produced twelve tales, or short novels, of which 'Trois Hommes Forts,' which was published in 1850, displays most talent; but his reputation chiefly rests on his two comedies, 'La Dame aux Camélias,' represented for the first time at the Vaudeville, February 2, 1852, and his 'Demi Monde,' produced at the Gymnase in April 1855. Each of these comedies has been performed upwards of one hundred nights, and the receipts of both have nearly reached 200,000 francs. The real talent and accurate delineation of manners exhibited by this young dramatist are not to be disputed, but the tendency of what he has written is perhaps still more pernicious than that of his father's productions.

* DUMAS, JEAN BAPTISTE, one of the most celebrated of living French chemists. He was born at Alais, department of Gard, in 1800, and studied pharmacy in his native village. In 1814 he commenced his medical studies at Geneva, where his devotion to the sciences of botany and chemistry attracted the notice of the celebrated De Candolle, professor of botany in that university, who gave him free access to his library and herbarium. He made also the acquaintance of another distinguished Genevese philosopher, Dr. Prevost. In conjunction with the latter he performed many experiments, and published many papers on physiological and pathological subjects. These papers attracted so much attention that when M. Dumas went to Paris in 1821, he found that his fame had gone before him, and he received there a very flattering reception. In 1823 he was appointed demonstrator of chemistry at the École Polytechnique and professor of chemistry at the Athénée. He shortly after married a daughter of the distinguished chemist Alexandre Brongniart, and from this time devoted himself exclusively to the study and advancement of chemical science. His attention was early drawn to the subject of organic chemistry, and the vast progress which this department of science has made within the last twenty-five years is indissolubly connected with the name of Dumas. His researches upon the ethers, the laws of isomerism, the law of substitution, and the atomic weights of elementary substances, stand out as amongst the researches which must make the 19th century remarkable in the annals of science.

The papers and works published by M. Dumas are very numerous, and many of them of the highest practical value. His earliest literary labours were principally physiological, and were chiefly devoted to an examination of the blood and muscular fibre, and experiments upon generation. It is however in these papers that we discover that early taste for physiological study that has given so decided a character to his subsequent career as a chemist. In these researches he associated himself with Prevost, and in his latter researches we find his name frequently associated with another celebrated Frenchman, Boussingault. His papers are by far too numerous to enumerate. They have been devoted to such subjects as statical chemistry, the action of heat upon organic bodies, on chemical types, on the true atomic weight of carbon, on the constitution of atmospheric air, on the neutral azotised matters of organised bodies, on the fattening of cattle and the formation of milk, on the composition of water, on the combinations of phosphorus, on the oxide of carbon, on isomerism, on the chlorides of sulphur, on the nature of indigo, on the combinations of hydrogen and carbon, on compound ethers, on ethyle. These are the subjects of some of his papers, and the chemist will immediately detect amongst them some of the most important questions that have occupied the minds of chemists during the last twenty-five years. Many of these papers have been collected and published in a larger work, entitled, 'Recherches sur la Chimie Organique.' He has also published a course of lectures entitled 'Leçons sur la Philosophie Chimique.'

Whilst continually publishing the results of his chemical researches, Dumas has been one of the most active of the public men of France. He was one of the founders in 1829 of the École Centrale des Arts et Manufactures, and one of its teachers of chemistry. In 1834 after a brilliant concours he was made professor of organic chemistry in the École de Médecine. In his position as teacher he not only exhibited the accuracy of the profound chemist, but by his eloquence he succeeded in attracting large audiences to his lectures. In 1846 he was made president of the Society for the Encouragement of Industry. He has been often selected by the government of France to report on the various economic questions in which the science of chemistry was needed for the full development of a subject. In 1849 he was entrusted with the portefeuille of agriculture and commerce, which office he held till 1851. In this year he acted as vice-president of the Great Exhibition of London. After the coup d'état he became one of the consultative commission, and has since been made vice-president of the superior council of public instruction in France. In all movements which have had for their object the extension of education and the amelioration of the condition of the people, M. Dumas has been a leading spirit, and few men of science occupy a higher rank in their own country, and have obtained more widely the admiration and esteem of the world, than the subject of this notice.

DUMONT, PIERRE-ÉTIENNE-LOUIS, was born at Geneva in July 1759. His father died when he was very young, leaving a

widow, three daughters, and a son (the subject of the present article), with very small means of support. The mother however was a woman of strong mind, and struggled against the difficulties arising from her straitened circumstances, that she might give her son a good education. At college Dumont assisted to support himself by giving private lessons. In his twenty-second year he was ordained minister of the Protestant church in Geneva; and we are told by M. Sismondi that his preaching was greatly admired. He left Geneva in the spring of 1783, owing to the triumph then achieved by the aristocratical party in that state through foreign interference; and he betook himself, a voluntary exile, to St. Petersburg, where he assumed the charge of the French Protestant church. He stayed in that city eighteen months, acquiring fame by his preaching; when he was invited to London by Lord Shelburne, afterwards the Marquis of Lansdowne, to undertake the education of his sons. In Lord Shelburne's house he made the acquaintance of Fox, of Sir Samuel Romilly, of Lord Holland, and most of the other distinguished members of the Whig party; and with Sir Samuel Romilly in particular he formed a strong friendship. In 1788 Dumont and Sir Samuel Romilly visited Paris together, and it was on the occasion of this visit, which lasted only two months, that Dumont first became acquainted with Mirabeau.

In 1789 Dumont made a second visit to Paris, accompanied by M. Duroverai, in order to negotiate with M. Necker, who was then minister, for the liberty of Geneva and the return of her exiles. He stayed in Paris until the beginning of 1791, and during this second visit the acquaintance previously formed with Mirabeau ripened into intimacy. We learn from Dumont's posthumous work, entitled, '*Souvenirs sur Mirabeau*,' (a work which has thrown great light on Mirabeau's character, and which is further interesting as giving Dumont's views concerning the French Revolution), that Mirabeau frequently during this period availed himself of the assistance of Dumont and Duroverai, especially the former, in the preparation of speeches and reports. These three also set on foot conjointly a paper called the '*Courier de Provence*;' though Mirabeau's share in the composition of it was not very great.

It was not until Dumont's return to England in 1791 that his intimacy and co-operation with Mr. Bentham commenced. [BENTHAM.] Admiring Mr. Bentham's talents, and impressed with the importance of his pursuits, he craved leave to arrange and edit those writings on legislation which their author would not himself publish. The task was one comparatively humble, yet useful. Further, it was a task of some difficulty. "I have had," says Dumont himself, in his preface to the '*Traité de Legislation*,' "to select from among a large number of various readings, to suppress repetitions, to clear up obscurities, and to fill up lacunæ which the author had left that he might not slacken in his work. I have had to do much more in the way of curtailment than of addition, of abridgment than of extension. The mass of manuscripts which has passed through my hands, and which I have had to decipher and compare, is considerable. I have had to do much to attain uniformity of style, and in the way of correction; nothing or next to nothing as regards the fundamental ideas. The profuseness of their wealth was such as to need only the care of an economist, and being appointed steward of this large fortune, I have neglected nothing which could improve its value or help to put it into circulation." (p. 2.)

The following are those of Mr. Bentham's works which were edited by Dumont. 1. The '*Traité de Legislation*,' 3 vols., published in 1802. 2. The '*Théorie des Peines et des Remises*,' 2 vols. in 1811. 3. The '*Tactique des Assemblées Législatives*,' in 1815. 4. The '*Preuves Judiciaires*,' 2 vols. in 1823. The '*Organisation Judiciaire et Codification*,' in 1828.

In 1814 Dumont had returned to Geneva, his native state having then recovered her independence. He was elected a member of the representative council of Geneva, and having been appointed on a committee that was to draw up laws and regulations for the council he was the author of the plan that was ultimately adopted. He afterwards directed his efforts to a reform of the penal system and the prison system existing at Geneva. Under his auspices, a penitentiary establishment was erected at Geneva in 1824, on the Panopticon plan of Mr. Bentham. Dividing his time between his senatorial duties and the publication of those of Mr. Bentham's works which have been named, he lived a useful and a happy life to the age of sixty. He died suddenly in the autumn of 1825, while travelling in the north of Italy.

There is a brief memoir of Dumont by M. de Sismondi in the '*Revue Encyclopédique*,' tom. 44, p. 258; and another by M. de Candolle in the '*Bibliothèque Universelle*' for November 1829. M. Duroverai has also prefixed a short notice of his life to the '*Souvenirs sur Mirabeau*.'

DUMONT D'URVILLE, JULES-SEBASTIEN-CÉSAR, a French navigator and naturalist, was born May 23, 1790. He is known in the scientific world as having made several valuable contributions to the science of botany. One of his earliest contributions to botany was a memoir on the plants which he had himself collected in the Grecian Islands, and which was published at Paris in 1822, with the title '*Enumeratio Plantarum quas in insulis Archipelagi aut Littoribus Ponti Euxini, annis 1819 et 1820, collegit atque detexit*.' In the

'Memoirs of the Linnean Society of Paris in 1826,' he published a Flora of Falkland's Island, with the title '*Flores des Malouines*.' In the sixth volume of the '*Annales des Sciences Naturelles*' he published an essay on the distribution of the ferns over the surface of the earth. These are his principal labours as a botanist, but Dumont D'Urville will be better known to posterity as an able, persevering, and successful navigator. In 1826 he was appointed by the king of France to the command of the frigate '*Astrolabe*,' for the purpose of making a voyage in search of information with regard to the unfortunate La Perouse and his companions. The vessel left Toulon in March 1826, and continued out till 1829. During the first part of his voyage Dumont D'Urville failed of attaining the object of his expedition, but having put in at Hobart Town in Van Diemen's Land, he heard that Captain Dillon had obtained information with regard to the object of his search at the island of Vanikoro, or Malicolo. He accordingly sailed for that island, and reached it in January 1828. Here he found undoubted evidence of the wreck of the two frigates, on the breakers of this island, which were under the command of La Perouse. This island is one of the group called Solomon's Islands, in 11° 41' S. lat. and 167° 5' E. long. Having ascertained that the lives of many of the sailors had been saved from the wreck, but that they had built another vessel and sailed from the island, he erected a monument to the memory of those who perished, and returned home. Some of the portions of the wrecks of the two vessels were recovered. During this voyage very important surveys of coasts and islands were made; among them a survey of the north part of New Zealand, Tongataboo, Fidjee Archipelago, Loyalty, Deliverance, New Britain, New Ireland, New Guinea, Fataka, Vanikoro, Hogollu, Guam, and the Moluccas. A full account of this memorable voyage was published in 1830 and successive years by Dumont D'Urville. This work is a splendid contribution to science. The five volumes descriptive of the voyage were written by Dumont D'Urville; one volume, on the Botany of the islands of the South Seas, was written by Lesson and Richard; one volume, on the Entomology, by Boisduval; and four volumes, on the Zoology of the same districts, by Quoi and Gaimard. The work was accompanied by an atlas of 45 maps, 243 plates of views, portraits of natives, &c., and above 100 plates of objects in natural history. The title of this work is '*Voyage de la Corvette l'Astrolabe exécuté par ordre du Roi pendant les années 1826, 1827, 1828, 1829*,' Paris, 8vo, plates, folio.

In 1837 Dumont D'Urville had placed under his command the frigates '*Astrolabe*' and '*Zélé*,' for the purpose of making a voyage to the South Pole. In a first attempt he reached the latitude 64° S., and explored to some extent what he thought to be a new coast; he was obliged however to retire on account of the icebergs. Having remained for some time at Conception, he made a second attempt, and discovered a coast at 66° 33' S. lat., 138° 21' E. long. He found himself here close to the south magnetic pole, the magnetic needle becoming nearly vertical. The coast thus discovered appeared one mass of ice, but portions of rock here and there projected, from which specimens were obtained by means of a boat's crew. It appears that the same land was discovered the same day by an American vessel in 64° 20' S. lat., 154° 18' E. long. Captain Ross has since reached 78° 11' S. lat., 161° 27' W. long. The land thus discovered by Dumont D'Urville he named after his wife Adélie. On his return to Paris he published an account of this expedition with the official reports of the minister of marine, under the title '*Expedition au Pôle Austral et dans l'Océan des Corvettes de sa Majesté*,' Paris, 1839.

This brave sailor and excellent man met with his death on the 8th of May 1842, by a railway accident that occurred between Versailles and Meudon, by which himself, with his wife and son, and nearly fifty fellow passengers, were killed.

DUMOURIEZ, CHARLES-FRANÇOIS, was born at Cambrai in 1739. His father was commissary in the army, and was also an author and a poet. Dumouriez entered the army at an early age, and served in Germany during the Seven Years' war. After the peace of Paris, 1763, he travelled about Europe, offering his services to several states: he visited Corsica, and afterwards Spain and Portugal, and wrote an essay on the military situation and resources of the latter kingdom. Having returned to France, he was appointed quarter-master-general to the French expedition for the conquest of Corsica, 1768-69. He was afterwards sent to Poland on a mission to the confederates of Bar, with whom he made the campaign of 1771 against Russia. He was subsequently sent by Louis XV. on a confidential mission to Sweden, in the same manner as the Chevalier D'Won, count Broglie, and others, who were sent to England and other countries, and who corresponded directly with the king without the intervention of his ministers. The ministers however became jealous of Dumouriez, and found means to arrest him at Hamburg, whence he was brought back to Paris under a lettre de cachet, and lodged in the Bastille.

He was released by Louis XVI. on his coming to the throne, and restored to his rank of colonel. In 1778 he was sent to Cherbourg to form there a great naval establishment connected with the proposed invasion of England, and he furnished the ministry with plans for the conquest of the islands of Jersey, Guernsey, and Wight. At the beginning of the revolution he took the popular side, and became connected with the Girondins, by whose interest he was appointed minister of foreign affairs, in which capacity he prevailed upon the king to

declare war against Austria in April 1792. Soon after he left office, upon the dismissal of the other Girondin ministers, Roland, Servan, Clavière, &c. Dumouriez had now become afraid of the violence of the revolutionary movement, the Jacobins hated him, and even the Girondins grew cool towards him. Like La Fayette, he professed his attachment to the constitutional monarchy of 1791, which the others had given up. He withdrew himself however from internal politics and went to serve under General Luckner on the northern frontiers. After the 10th of August he was appointed to replace La Fayette in the command of the army which was opposed to the Duke of Brunswick. The army was disorganised, but Dumouriez soon re-established order and confidence; he obtained a series of partial but brilliant successes, which checked the advance of the Prussians, and, lastly, he made a determined stand in the forest of Argonne, which he styled the Thermopylae of France, by which means he gave time to Kellerman and other generals to come up with fresh divisions, and give battle to the Prussians at Valmy, 20th September 1792, an engagement which was won by Kellerman. It is generally allowed that Dumouriez's stand at Argonne was the means of saving France from a successful invasion.

At the end of October Dumouriez began his campaign of Flanders; gained the battle of Jemmapes against the Austrians, 6th and 8th of November; took Liege, Antwerp, and a great part of Flanders, but, on account of some disagreement with Pache, the minister at war, he was obliged to return to Paris during the trial of Louis XVI. After the execution of the king, Dumouriez returned to his head-quarters, determined to support, on the first opportunity, the re-establishment of the constitutional monarchy under the son of Louis. Meantime he pushed on with his army, entered Holland, and took Breda and other places, but being obliged, by the advance of Prince Cobourg, to retire, he experienced a partial defeat at Neerwinde, and again at Louvain. Meantime he had displeased the convention by opposing its oppressive decrees concerning the Belgians, and he wrote a strong letter on the subject to that assembly on the 12th of March, which however was not publicly read. Danton, Lacroix, and other commissioners of the convention came successively to his head-quarters to watch and remonstrate with him, but he openly told them that a republic in France was only another name for anarchy, and that the only means of saving the country was to re-establish the constitutional monarchy of 1791. Dumouriez entered into secret negotiations with Prince Cobourg, by which he was allowed to withdraw his army unmolested to the frontiers of France, and also his garrisons and artillery which he had left in Holland, and which were cut off by the advance of the enemy. These favourable conditions were granted by Cobourg on the understanding that Dumouriez should exert himself to re-establish the constitutional monarchy in France. Dumouriez retired quietly to Tournay, and evacuating Belgium withdrew within the French frontiers, where he placed his head-quarters at St. Amand, 30th March 1793. He was now accused of treason at Paris: the convention passed a decree summoning him to their bar, and four commissioners, with Camus at their head, came to St. Amand to announce to him the summons. Dumouriez replied that he was ready to resign the command, if the troops consented, but he would not go to Paris to be butchered. After a violent altercation he gave the commissioners in charge to some hussars, and sent them over to the Austrian general Clairfait, at Tournay, to be detained as hostages.

His design was now to march upon Paris, but his troops, and especially the volunteers, refusing, he was obliged to take refuge himself, with a few officers, at the Austrian head-quarters, April 1793. He there found out that his plan of a constitutional monarchy was disavowed by the allies, and in consequence he refused to serve in the Austrian army against his country. He wandered about various towns of Germany, treated with suspicion, and annoyed by the royalist emigrants, who hated him as a constitutionalist, while in France the Convention offered a reward of 300,000 francs for his head. Having crossed over to England, he was obliged to depart under the Alien Act, and took refuge at Hamburg, where he remained for several years, and wrote his memoirs and several political pamphlets. In 1804 or 1805 he obtained permission to come to England, where he afterwards chiefly resided. He is said to have furnished plans to the British and Portuguese governments for the operations of the Peninsular war; and he received a pension from the British government, upon which he lived to a very advanced age. It is remarkable that after the restoration he was not recalled to France by Louis XVIII. In 1821 he wrote a plan of defence for the Neapolitan constitutionalists. He died in March 1823, at Turville Park, near Henley-upon-Thames, at the age of eighty-four. (*Mémoires du Général Dumouriez*, written by himself; Supplement to the 6th Volume of the *Biographie des Contemporains*.)

DUNBAR, WILLIAM, is supposed to have been a grandson of Sir Patrick Dunbar, of Roslin, in the shire of Haddington. This Sir Patrick Dunbar was a younger son of George, tenth earl of March. He was thus also a younger brother of George, eleventh earl, who was attainted in an arbitrary manner, and had his possessions forfeited by king James I. in the parliament held at Perth on the 10th of January 1424-5; and it appears that Dunbar, being involved in the common ruin of the house, lived in a state of great dependence without any patrimonial inheritance. From his earliest years Dunbar was

destined for the church. In 1475 he was sent to the University of St. Andrews, where he passed Bachelor of Arts, in St. Salvator's College there, in 1477, and in 1479 Master of Arts. He afterwards entered the monastic order of St. Francis; and in the habit of a friar travelled throughout the south of Scotland, into England, and on the continent. From his writings we learn that he was frequently employed abroad in the king's service, probably as a 'clerk' in some of the numerous missions despatched by king James IV. to foreign courts. Of his own fidelity to his royal master on these occasions he erects a tolerably high opinion; and few opportunities escaped of his reminding the king of the nature and extent of his services, with not merely distant hints, but direct intimations of the propriety of a recompense. On the 15th of August 1500, he had a grant from the king of an annual provision of 10*l.* during his life, or until he should be promoted to a benefice of the value of 40*l.* or more yearly.

In 1501 he was again in England, probably in the train of the ambassadors who were sent thither to conclude the negotiations for the king's marriage. The preparations for this marriage began on the 4th of May 1503; and upon the 9th of that month Dunbar composed his poem of 'The Thistle and the Rose,' an elegant allegory in celebration of the union. On the 7th of March following he said mass for the first time in the royal presence, and received a liberal gift as the king's offering on the occasion. In 1505 he also received a sum from the king in addition to his stated pension; and both that year and the next a sum equal each time to his half-yearly allowance in lieu of his 'yule gown.' In 1507 his pension was doubled; and besides occasional marks of the royal bounty, he had a letter under the privy seal in August 1510, increasing the sum to fourscore pounds a year, and until he should be promoted to a benefice of 100*l.* or upwards. This allowance he continued to receive, with other gifts, till the time of the king's death at Flodden in September 1513, after which we find no farther mention of Dunbar's name in the treasurer's account, or other like records. He is supposed to have died about 1520.

Whether he at last obtained a benefice, the great object of his desires, does not appear. His remaining works do not show that he ever did. On the contrary, they contain many supplications for a benefice, and many lamentations for the want of one; and the various forms and character of these pieces display not a little of that fertility of invention by which Dunbar is distinguished. He seizes every occasion and seems to exhaust every expedient to rouse the king to bestow upon him the long-cherished wish of his heart.

Dunbar's writings now extant are not numerous, but they exhibit a remarkable versatility of genius, from grave to gay, from witty to severe. At one time we find him the sober moralist; at another, indulging in all the immodesty of licentiousness. But it is in description that he shows his various powers most conspicuously. Thus, in his 'Golden Terge,' as in 'The Thistle and the Rose,' we have imagery brilliant and dazzling. In the 'Dance of the Deadly Sins in Hell,' the same creative hand appears. 'The Feigned Friar of Tungaund' and 'The Justs between the Taylor and the Souter,' display a like power of vividly portraying character, mingled with bitter sarcasm and biting satire. And in the doggerel lines 'On James Doig' we see the burly wardrobe-keeper pass before us.

The existence of Dunbar's works is a signal proof of the immortality of real merit. We know not at what precise time he was born, nor when he died; his very name, it has been remarked, is, with one solitary exception, not to be met with in the whole compass of our literature for 200 years; and it is only after the lapse of three centuries that his poems have been collected and published; and yet he now once more stands forth as, in the opinion of his countrymen, one of the greatest of Scotland's poets.

DUNCAN, ADAM, FIRST VISCOUNT, was born July 1, 1731, at Dundee, of which his father was provost in 1745. By the mother's side he was descended, through the Haldanes of Glenegles, from the Earl of Lennox and Monteith. He entered the navy in 1746, was made post-captain in 1761, and distinguished himself in several actions, especially at that of Cape St. Vincent. In 1787 he became a rear-admiral, and seven years afterwards was appointed to command in the North Seas. In this service he watched the mouth of the Texel, where a large Dutch fleet lay at the time of the mutiny at the Nore. By skilful manœuvring, although deserted by every ship except one ('Adamant,' 50), he detained the Dutch until he was joined by the rest of the fleet, and, on their leaving port, cut off their retreat and brought them to action at Camperdown, where, after a brilliant action, he captured nine sail of the line and two frigates. For this service Admiral Duncan was created a Viscount, and received the thanks of parliament. He died suddenly, August 4th, 1804. By his lady, the daughter of Lord President Dundas, he left two sons and several daughters. His eldest son was created Earl of Camperdown, at the coronation of William IV. His youngest, Sir Henry Duncan, was principal storekeeper to the Board of Ordnance, and died, in 1835.

* DUNDONALD, THOMAS COCHRANE, TENTH EARL OF, was born in December 1775, the eldest son of Archibald, earl of Dundonald, who had considerable distinction as a chemist. In 1793 he entered the naval service under his uncle, Captain afterwards Sir Alexander Cochrane. In a course of service in various ships on the American coast, and also in the Mediterranean, during the war between Great

Britain and France, he distinguished himself by actions of extraordinary daring and intrepidity, assisting in capturing enemy's vessels at sea against great odds, or in cutting rich prizes out of harbours where they were protected by land-fortresses. For one such action—the capture by boarding of a Spanish frigate off Barcelona—he was made post-captain in 1801. His ship, the 'Speedy,' sloop-of-war, having been captured in the following year by a French squadron, he was for some time a prisoner of war. On his exchange he served, as commander of the 'Arab' frigate, at the blockade of Boulogne in 1803. From 1804 to 1806 he commanded the 'Pallas' frigate, and from 1806 to 1809 the 'Imperieuse' frigate, both employed in cruising about the Spanish and French coasts. Uniformly successful in actions of the most desperate character against both ships and batteries on these coasts, he was chosen by the Admiralty in 1809 to command a fleet of fire-ships sent to destroy the French fleet then blockaded in the Basque roads by Lord Gambier. He accomplished the difficult and dangerous work most successfully on the night of the 11th of April, and was rewarded with the Knighthood of the Bath. Before this period he had been elected to the House of Commons, first for Honiton, and afterwards (1807) for Westminster. In parliament he distinguished himself by his strong opposition to the government and his opinions on radical reform, more especially after the accession of the Liverpool-Castlereagh administration in 1812. An opportunity of taking revenge upon him for this soon occurred. In February 1814 a false rumour was spread of Napoleon's abdication, which caused a great rise in the funds, and he was accused of being concerned in the propagation of the report for interested purposes. Tried on this charge, he was found guilty of fraud, and was sentenced on the 5th of July to stand in the pillory, pay a fine of 1000*l.*, and undergo one year's imprisonment; and he was at the same time expelled from the House of Commons, deprived of the Order of the Bath, and struck off the list of captains. That part of his sentence which involved the punishment of the pillory was remitted; and so convinced were the public that he had been the victim of party feelings, that he was immediately re-elected to parliament for Westminster. Having made a daring escape from prison, and appeared in his place in parliament, he was recommitment, but his fine was paid by public subscription, and on the expiration of his imprisonment he resumed his seat as an opponent of the ministry. Seeing no prospect of further employment in the British service, he accepted in 1818 the command of the fleet of the Chilians, then fighting for their independence. In this capacity he distinguished himself, as before, by actions of almost incredible courage and skill—such as cutting out the frigate 'Esmeralda' from under the guns of Callao on the 5th of November 1820. In 1822 he exchanged the Chilean service for that of Brazil, and in 1823 he was made Marquis of Marañón by the Brazilian emperor, Don Pedro. On quitting the Brazilian service he returned to England; but again, in 1827 and 1828, his talents were employed with their usual success in a foreign naval service—that of the Greeks, then asserting their independence. Returning to England, and succeeding to the title of Lord Dundonald by his father's death, he was, on the accession of the Whigs to power in the first year of the reign of William IV. (1830), reinstated in his command in the British navy, and made rear-admiral. He was made Vice-Admiral of the Blue in 1841; in 1847 the Order of the Bath was restored to him; in 1848 he received the command-in-chief of the fleet on the West Indian and North American stations; in 1851 he became Vice-Admiral of the White; and in 1854 Admiral of the United Kingdom. That he was perfectly innocent of the Stock-Exchange fraud was satisfactorily established before these official recognitions of his great merits were added to the public esteem. Of great scientific attainments, Lord Dundonald is understood long to have been in possession of some extraordinary submarine method for blowing up ships; and during the Russian war he offered to the British government to destroy Sebastopol in a few hours by a plan of his own. A committee was appointed to confer with him on his plan, which however was rejected. Lord Dundonald is the author of one or two works, in one of which, entitled 'Observations on Naval Affairs,' &c., published in 1847, he gives an account of his naval services, and of the "injustices experienced by him" at the hands of the British government.

DUNN, SAMUEL, was a native of Crediton, Devonshire, where he kept a mathematical school for several years; but he afterwards removed to Chelsea, and occupied himself in the same manner. He was well skilled in nautical astronomy, and was a good practical observer, which led to his being appointed mathematical examiner of the candidates for the East India Company's service. He was the author of several useful and ingenious papers in the 'Philosophical Transactions,' as well as of some separate works on the practical branches of science. He also published a folio Atlas, which has been held in some estimation. Mr. Dunn bequeathed an estate of about 30*l.* a year to found a mathematical school in his native town, the first master to which was appointed in 1793.

DUNNING, JOHN, Lord Ashburton, the son of an attorney at Ashburton in Devonshire, was born on the 18th of October 1731. He was removed from the free-school at Ashburton, and articled to his father as a clerk, in the thirteenth year of his age. Sir Thomas Clarke, the then master of the rolls, who employed old Mr. Dunning as his attorney, having observed the young man's capabilities for active business, induced him to study for the bar. He entered of the

Middle Temple, May 8th 1752, and was called to the bar, according to the Temple books, July 2, 1756.

Dunning travelled the western circuit for some years without any success; but in 1761, through the good offices of Mr. Hussey, a king's counsel, being appointed to draw up the reply of the East India Company to the Dutch memorial, he acquired some connections, which were considerably increased by his argument in the case of *Combe v. Pitt* (Trin. Term, 1763), which he was called upon to make in consequence of the illness of his leader. In the course of the same year the question as to the legality of general warrants arose, in consequence of the arrest of the publishers of the 'North Briton.' Dunning throughout the whole litigation was employed as the advocate of his friend Wilkes; and the argument on the Bill of Exceptions (June 1765) afforded him an opportunity of establishing his reputation. After this his business rapidly increased; he was shortly after chosen recorder of Bristol, and in December 1767, appointed solicitor-general.

In the following year he entered parliament as one of the nominees of Lord Shelburne for the borough of Calne. A Whig in his politics, and an accomplished constitutional lawyer, Dunning throughout his parliamentary career unflinchingly opposed the Tories. He laboured strenuously while in opposition to reduce the pension list, but became himself a pensioner to the amount of 4000*l.* a year, when in the spring of 1782, he was raised to the peerage by the title of Baron Ashburton, of Ashburton in the county of Devon. Possessing the most lucrative practice of the day, which had already enabled him to purchase considerable landed property, and to save a sum little short of 180,000*l.*, and having besides within a week after this promotion possessed himself of a lucrative sinecure, the chancellorship of the duchy of Lancaster, Dunning had not even the poor excuse of poverty for this political profligacy. This venality and want of principle, which so often unfortunately obscure the fair fame of individuals, are not wholly without profit to the public; they afford an example which acts as a warning to them against placing implicit confidence in the unbounded professions of ambitious and unprincipled men; for however popular, however distinguished may be the name of such a man in his own day, a few short years are sure to consign him to well merited neglect, if not contempt. Such, as a politician and a pretender to probity, has been the lot of Dunning. As a lawyer none of his contemporaries enjoyed a higher reputation, or more lucrative practice: his wit appears to have been of that brilliant nature which defies description. In person Dunning was small, and singularly weak and awkward; his action in speaking clumsy and uncouth, but the awkwardness of his gesticulation was soon lost sight of in the interest aroused by his eloquence. Notwithstanding his disadvantages, he was extremely vain of his personal appearance, and wished to encourage the belief that his face and figure had irresistible charms in the eyes of the fair sex.

Dunning married in 1780 Miss Elizabeth Baring, the daughter of a retail tradesman at Exeter, by whom he had two sons. The death of the eldest in April 1783, is supposed to have given so great a shock to the already enervated frame of Lord Ashburton as to have hastened his death, which took place at Exmouth in the August following.

The title of Baron Ashburton having become extinct, was revived in the year 1835, in the person of Mr. Baring, a descendant of the Miss Elizabeth Baring mentioned above.

DUNS SCOTUS, JOHN, was born most probably about the year 1265. The English, the Scotch, and the Irish, have all claimed him as a countryman. According to one of the Irish accounts, he was born at Thathmon, or Taghmon, in Wexford; according to another, in the town of Down, or Downpatrick. The Scotch say he was a native of Dunse in Berwickshire. The English story is, that he was born at a hamlet called Dunston, or Dunstanoe, in the parish of Emilden, or Embleton, not far from Alnwick, in Northumberland. Camden conceives he was called Scotus because descended from Scottish parents. It seems however to be agreed on all hands that he was chiefly educated in England. He is said to have been found when a boy tending his father's cows by two Franciscans who were greatly struck with his intelligence; and by the monks of this order he was first instructed in the elements of learning, and then sent to Merton College, Oxford, of which in due course he became a fellow. He also entered the order of Franciscans. Passing over various stories that are told of him of a legendary cast, we may enumerate in a few lines the authentic events of his life. While yet a student, he is said to have become greatly distinguished for his proficiency in theology, in logic and metaphysics, in civil and canon law, in mathematics, in natural philosophy, and in astronomy. In 1301, on the removal of William Varron to Paris, he was appointed to the theological chair. His prelections were attended by crowds of auditors, the number of students at Oxford at this time, it is affirmed, exceeding 30,000; but many of these, according to Anthony à Wood, were more given to habits of dissipation than to study. In 1307 Duns removed from Oxford to Paris, in which city he had on a visit some time before distinguished himself in an extraordinary manner by his defence, in a public disputation, of the doctrine of the immaculate conception of the Virgin Mary. He began, we are told, by demolishing two hundred objections to the doctrine, and concluded by establishing it with a cloud of arguments. A writer

who was present, Pelbartus à Temeswar, says that he resolved the knottiest syllogisms of his adversaries as Samson did the bands of Delilah. The result was the conversion of the whole university to the doctrine thus demonstrated, and the passing of a regulation that no person should afterwards be admitted to a degree without swearing to defend the immaculate conception. On this occasion, it is said, there was formally conferred on Scotus the title of the Subtle Doctor (*Doctor vel Magister Subtilis*), by which he is commonly distinguished among the schoolmen. He taught in his new chair with as much applause as at Oxford, but he was not allowed to remain long at Paris. In 1308 he was ordered by the general of his order to remove to Cologne to found a new university there. On reaching Cologne he was met by nearly the whole body of the citizens, and drawn into the city in a triumphal car. But his splendid career was now near its close. On the 8th of November, in this same year, he was carried off by a fit of apoplexy. Some accounts make him to have died in his forty-third, others in his thirty-fourth year. Paulus Jovius relates that he was buried before he was dead, and that it was afterwards found, upon inspection of the grave, that in his misery he had knocked out his brains against his coffin. Another version of the story is, that he was found to have gnawed the flesh from his arms.

Various separate treatises of Duns Scotus were sent to the press soon after the invention of printing, and several of them have been repeatedly printed. At length, in 1639, his collected works appeared at Lyon, in 12 vols. folio, under the title of 'R. P. F. Joannis Duns Scoti, Doctoris Subtilis, Ordinis Minorum, Opera omnia que hucusque reperiri poterunt, collecta, recognita, notis, scholiis, et commentariis illustrata; à PP. Hiberniæ Collegii Romani S. Isidori Professoribus, Jussu et Auspiciis Rmi. T. F. Joannis Baptistæ à Companeæ, Ministri Generalis.' A complete copy of this collection is exceedingly rare. It is dedicated to Philip IV. of Spain, and the editor is Luke Wadding, an Irishman by birth. It does not however, as has been often stated, contain all the works of Scotus, but only those designated his 'Opera Speculativa,' the 'Positiva,' if they should be completely recovered, having been intended to form a future publication. The principal pieces of which it is composed are Questions or Commentaries on the Sentences of Peter Lombard, and on the physical, logical, and metaphysical writings of Aristotle. There are also a treatise on Grammar; four books (forming a volume) entitled 'Reportatorum Parisiensium'; and a volume of 'Questiones Quodlibetæ,' the authenticity of which however is doubted by Wadding. The following are enumerated by Wadding as the 'Opera Positiva' of Scotus:—'Tractatus de Perfectione Statuum' (of doubtful authenticity); 'Lectura in Genesim'; 'Commentarii in Evangelia'; 'Commentarii in Epistolas Pauli'; 'Sermones de Tempore'; and 'Sermones de Sanctis.'

The admirers of Scotus extol his acuteness and subtlety as unrivalled, and he has always been accounted the chief glory of the Franciscans, as Thomas Aquinas has been of their rivals the Dominicans. If in his short life he actually wrote all the works that are commonly attributed to him, his industry at least must have been prodigious. His fame during his lifetime, and long after his death, was not exceeded by that of any other of the scholastic doctors. From him and Aquinas two opposing sects in theology took the names of Scotists and Thomists, and divided the schools down almost to the last age. The leading tenet of the Scotists was the immaculate conception of the Virgin, and they also differed from the Thomists on the subjects of free-will and the efficacy of divine grace. In philosophy the Scotists are opposed to the Occamists, or followers of William Occam, who was himself a pupil of Scotus, but differed from his master on the subject of Universals, or general terms, which the Scotists maintained to be expressive of real existences, while the Occamists held them to be nothing more than names. Hence the Scotists are called Realists, the Occamists Nominalists. It is a favourite opinion of Bayle's, that this doctrine of the Scotists was nothing less than an undeveloped Spinozism. ('Dict. Crit.' art. 'Abelard,' note C, and 'André Cialpin,' note B.) It may be added that the English term 'dunce' has been commonly considered to be derived from the name of the subtle doctor—"perhaps," says Johnson, "a word of reproach first used by the Thomists, from Duns Scotus, their antagonist." It is worth noting however that a dolt or a blockhead appears to be a very modern meaning of the word 'dunce,' or Duna. It does not seem to have been known in this sense, for instance, to Richard Stanishurst, the compiler of the 'Description of Ireland' in Hollinshed, who speaks of the name of Scotus being a term "so trivial and common in all schools, that whose surpasseth others either in cavilling sophistry or subtle philosophy is forthwith nicknamed a Duns." This was no doubt the kind of reproach originally intended to be conveyed by the epithet.

Wadding has prefixed to his edition of the works of Scotus an elaborate life of the author, which was reprinted at Mons in 12mo in 1644. There is also a 'Tractatus de Joannis Scoti Vita, &c., Auctore R. F. Joanne Colgano, ordinis Fratrum Minorum Hibernorum Padum,' 12mo, Antwerp, 1655. Both these works, the latter especially, are full of legendary matter, detailed with the most confiding gravity.

DUNSTAN, SAINT, was born of noble parents at or near Glastonbury in Somersetshire, in the first year of the reign of Athelstan, 925. His father's name was Heorstan; his mother's, Cynethryth, or Cynedryda. His earliest instruction in the learning of his time was received in the neighbouring monastery; but afterwards, under the

patronage of his uncle, Athelm, archbishop of Canterbury, he was introduced at Athelstan's court, where he passed some years. The jealousy of the courtiers at his superior attainments at length led them to circulate against him a charge of sorcery; and, finding that he had lost the favour of the king, he retired to Winchester. Urged by the entreaties and remonstrances of his uncle to become a monk, Dunstan, who is said to have been passionately in love with a young lady of surpassing beauty, for a time strongly resisted; but, visited by a serious illness, which his uncle pronounced to be a manifestation of the divine displeasure at his preference for an earthly bride to the Holy Church, he made a vow to renounce the world. Accordingly, on his recovery, he built for himself, against the walls of the church of Glastonbury, according to the common account, but, as others say, against Winchester Cathedral (Wright, 'Biog. Brit.', 448), a sort of cell, with an oratory, employing his time partly in devotional austerities, and partly in the exercise of such manual arts as were useful to the service of the church, in the formation of crosses, censers, &c. He is also reputed to have painted, and to have copied manuscripts. His austerities procured for him a general reputation for extraordinary sanctity, while he himself believed that he was the object of continual persecution by demons and evil spirits. The story is well known, how on one occasion the devil came to him at his smithy (for in his cell he kept a forge for the manufacture of metal articles of ecclesiastical furniture), and brought him a piece of iron which he wished him to forge to a particular form. Dunstan willingly undertook the task, but soon discovering who his visitor really was, seized him by the nose with a pair of red-hot pincers, as he put his head into the cell, and held him there till the malignant spirit made the whole neighbourhood resound with his bellowings. The story was said to have been told by Dunstan himself to the people who flocked to his cell to learn the cause of the extraordinary noise. It may readily be set down as one of those monkish fictions with which the biographies of the saints were in the middle ages so profusely garnished.

Glastonbury having by the successive incursions of the Danes been reduced nearly to ruin, Edmund, the successor of Athelstan, appointed Dunstan to be the abbot of that house, with full power to draw funds from the royal treasury for its restoration. This was in 942, and from a charter granted in 944 the work appears to have been soon accomplished.

Edred, the successor of Edmund, on the retirement of Turketul to the cloister, in 948, surrendered his conscience, his treasures, and his authority into the hands of Dunstan. Taking advantage of the implicit confidence reposed in him by the king, Dunstan determined to carry out his favourite project of the establishment of a strictly monastic system, and the bringing the clergy under the more direct supremacy of the papal power. As the first step, he imported into England a new order of monks, the Benedictines, who, by changing the state of ecclesiastical affairs, excited on their first establishment the most violent commotions. The discontinuance of marriage among the clergy, and the adoption of the most rigid monastic rules, were his great objects, and he introduced that reformation into the monasteries of Glastonbury and Abingdon. This conduct however incurred the resentment of the secular clergy, who, joining with such of the courtiers as had become indignant at the haughty demeanour of Dunstan, formed a powerful party against him. Upon the death of Edred, and succession of Edwy, Dunstan was accused of malversation in his office. On attempting to maintain his authority, he even went so far as to use personal violence to the king [Edwy]; but he was deprived of his abbacy, and banished the kingdom in 956, demoniacal laughter being heard to ring through the church, according to his partisans, at his departure, as, on the other hand, miraculous manifestations had on various occasions been exhibited on his behalf. Edgar, who succeeded Edwy in the following year, restored him to Glastonbury, having promoted him first to the see of Worcester; he then made him bishop of London, and in 959 advanced him to the archiepiscopal see of Canterbury. Dunstan repaired to Rome to receive the papal sanction to his appointment, and not only obtained that, but the pope's own appointment of him to be the papal legate in England. Upon his return, so absolute did his influence over the king become, that he was enabled to give the Romish see an authority and jurisdiction of which the English clergy had been before to a considerable degree independent. In order more effectually and completely to accomplish this object, the secular clergy were excluded from their livings and disgraced, and the monks were appointed to supply their places. The scandalous lives of the secular clergy furnished one plea for this measure, and it was not altogether groundless; but the principal motive was that of rendering the papal power absolute in the English Church. Dunstan, supported by Edgar's authority, overpowered the resistance which the country had long maintained against the papal dominion, and gave to the monks an influence, the baneful effects of which were experienced in England till the Reformation. Dunstan has accordingly been highly extolled by the monks and partisans of the Romish Church. During the whole reign of Edgar, Dunstan maintained his interest at court; and upon Edgar's death, in 975, his influence served to raise Edward, Edgar's eldest son, to the throne, though the succession of Ethelred, the younger son, was much pressed by Elfrida. Whilst Edward was in his minority, Dunstan ruled with absolute sway both in church and

state; but upon the murder of that prince in 979, and the accession of Ethelred, his credit and influence declined; and the contempt with which his threatenings of divine vengeance were regarded by the king is said to have mortified him to such a degree that, on his return to his archbishopric, he died of grief and vexation, May 19th, 988. A volume of St. Dunstan's works was published at Douay in 1626. His successful ambition has given him a considerable place in ecclesiastical and civil history. He appears to have been a man of extraordinary talents, of great energy, stern self-will, and unscrupulous purpose; and he exerted all his talents, energy, and unscrupulousness to advance the ecclesiastical power, and to subject all to papal supremacy. Dunstan's 'Concord of Monastic Rules' is printed at large in Reyner's 'Apostolatus Benedictinorum in Anglia,' fol., Duac, 1626, at the beginning of the third part of the Appendix, p. 77. A notice of the other writings attributed to him will be found in Wright, pp. 459-62.

(William of Malmesbury, *History; Life of St. Dunstan in the Acta Sanctorum* of the Bollandists, month of May, tom. iv., pp. 344-84; Wright, *Biog. Brit. Lit., Ang. Sax. Period*; Kemble, *Saxons in England*, book ii.; Lingard, *Hist. of Eng.*; Knight, *Pop. Hist. of Eng.*)

DUNTON, JOHN, an eccentric bookseller and voluminous writer of the 17th and 18th centuries, was born at Graffham in Huntingdonshire, on the 4th of May, 1659. The events of his life are soon told, the main interest attached to his name being comprised in his writings. His father was rector of Graffham, and, later in life, of Aston Clinton in Buckinghamshire, and was the third John Dunton in regular descent who had been minister in the church. The fourth John Dunton was designed by his father to follow the same course, but after trying a private school, and then a private education under his father, it was found that he had "such a disgust to the languages, that though he had acquired enough Latin to speak it pretty well extempore, the difficulties of Greek were unconquerable." His father at length resolved to apprentice him to a London bookseller when he was nearly fifteen. He served his time with satisfaction to his master, but became a zealous Whig in politics, and a dissenter in religion. Before he was out of his time he was active in getting up, from the apprentices of London, a remonstrance to the king, in reply to a long address praying for the prevention of petitions to parliament. This remonstrance was presented by the Lord Mayor. Dunton himself states that "the Tory apprentices had gathered five thousand names to their address; but ours, I speak modestly, had at least thirty thousand." This must be an exaggeration, if it means apprentices; but probably though got up by the apprentices it was signed by anybody.

In 1685 he commenced business for himself, and was for a time successful. He married a daughter of the non-conforming minister, Dr. Annesley, of whom another daughter married Samuel Wesley, afterwards rector of Epworth, and father of the distinguished founder of the sect of Methodists. Dunton's business however fell off greatly, indeed business of all kind suffered, after the defeat of the Duke of Monmouth at Sedgemoor; he therefore took a cargo of books to Boston in America. He was four months on his voyage, and suffered from the want of food and water. The venture was successful, and he remained there some time. While in America he visited an Indian station, of which he gives a curious but not a very correct account, and saw the Rev. John Eliot, the apostle of the Indians, of whose character and successful efforts for the conversion of the natives he speaks very highly. Towards the end of 1686 he returned, but found himself involved by having become surety for a sister of his wife. To escape the consequences he made an excursion to Holland, Flanders, and Germany.

On his return Dunton found his affairs settled, and again embarked in business as a publisher, in which he continued for ten years. He lost his wife, married again, had disputes with his wife and her mother about property, failed in business, and continued publishing pamphlets and other works till 1723, after which nothing is known of him except that he died in 1733.

Dunton was a most prolific writer, and a not less prolific projector. His writings were chiefly on religious, moral, or political subjects, but in nearly all of them he contrived to introduce much of his own personal affairs. With an inordinate degree of vanity he mixed considerable shrewdness of observation, and in the most entertaining of his works, 'The Life and Errors of John Dunton,' printed in 1705, he has given the "Lives and Characters of a Thousand Persons." It is amusing to see the principle on which they are introduced entirely with reference to himself—the authors who wrote for him, the bookellers he associated with, the printers he employed, and the person even who made the printer's ink. When he goes abroad it is the same; no eminence attracts him, but all with whom he has any acquaintance are characterized. The characters on the whole are done without ill-nature or prejudice, but are not very discriminative, and as he occasionally had intercourse with men whose memory yet lives, the sketches he gives are not uninteresting. In his characters of the booksellers he incidentally relates some curious facts with reference to their business. It thence appears that some single sermons and occasional pamphlets had a very large sale. Of Lukin's 'Practice of Godliness,' 10,000 were sold; of Keach's 'War with the Devil,' and 'Travels of True Godliness,' 10,000 were printed, and "they will sell to the end of time." With Goodwin, the printer to the House of

Commons, and two other printers, Dunton was in partnership for the printing of 'Dying Speeches,' a singular undertaking, as it seems to us now, to require the union of four respectable firms.

Of his other works, the most important were 'The Athenian Mercury,' which was published in weekly numbers from 1690 to 1696, forming twenty volumes. From this a selection in three volumes was made, under the title of the 'Athenian Oracle.' The papers consist of answers to queries, most of them imaginary, upon all sorts of questions. The plan, of which he was extremely proud, was Dunton's own, and his assistants were, at first, his brother-in-law, Wesley, Mr. R. Sault, a Cambridge theologian, and Dr. John Norris. The 'Dublin Scuffle' contains some curious particulars relating to social manners in Ireland; and 'Dunton's Creed, or the Religion of a Bookseller, in imitation of Brown's Religio Medici,' is a singular production.

DUPERRÉ, VICTOR GUY, a baron of the empire and a French admiral, was born at La Rochelle on the 20th of February 1775. He commenced his maritime career in the merchant navy, and went to India, but returned to France after a voyage of eighteen months; and war having broken out, he entered the republican service in 1795. During the next ten years he took part in many single ship-fights with the English, until he was promoted to the staff on board the Veteran, commanded by Prince Jerome Bonaparte, in 1804. In September 1806 he became captain, and took the command of the Sirène frigate. In March 1808 whilst off the coast of Bretagne, in company with the Itallienne, Duperré was chased by two ships and three frigates, and whilst making for the port of L'Orient, his passage was intercepted and he had to sustain for an hour and twenty minutes an unequal combat with two of the enemy's ships, keeping up a constant fire at once from both broadsides. Though repeatedly summoned to surrender, he contrived to bring off his frigate; an act of skilful intrepidity which did not escape the notice of Napoleon, who promoted him to the rank of ship captain. He performed several brilliant exploits in the Indian Ocean in 1808 and 1809, after which he became a baron of the empire and contre-amiral, August 20, 1810. In September 1823, he was appointed to command the French squadron lying before Cadiz, and contributed to the capture of that city. In 1826 he became commander in chief of the combined fleet in the Antilles.

In 1830 he was summoned to Paris in February by the government of Charles X. to be consulted respecting the meditated expedition against Algiers. In his reply, Duperré represented the undertaking as extremely perilous and uncertain, but in spite of his representations it was resolved upon, and the absolute command of the naval forces was confided to him. This fleet set sail on the 25th of May 1830. It consisted of 103 ships of war, and 572 vessels belonging to the merchant service, and other craft, the whole having on board 37,331 men and 4000 horses. After encountering many difficulties from the nature of the coast and contrary winds, Duperré appeared before the batteries of Algiers on the morning of the 13th of June. The signal share taken by Duperré in the siege and capture of this formidable fort, induced Charles X. to raise him to the peerage, July 14th, 1830, a few days before his own fall. This appointment was revoked by the government of July; but on the 13th of August 1830 the same government made him an admiral, and restored his peerage. He became minister of the naval department November 22, 1834; and was afterwards recalled twice to the same office under different administrations. He resigned this office on account of declining health, February 7, 1843, and died November 2, 1846.

* DUPERREY, LOUIS-ISIDORE, was born at Paris on the 21st of October, 1786. He entered into the military marine in 1803, and served on board various ships during the war. In 1817, when the corvette L'Uranie, under the command of Captain Louis de Freycinet, was sent out on a voyage of observation, Duperrey was specially charged with the operations of hydrography. The observations were chiefly carried on in the North Pacific Ocean, and Duperrey made a general map of the Marianne (Ladrone) Islands, and maps and plans of portions of the Caroline Islands, of the island of Guam, of anchorages among the Sandwich Islands, &c. In the night of February 15, 1820, the Uranie struck on a rock, and Duperrey having in one of the boats discovered a small bay, the Uranie was conducted there, and became a wreck, but everything on board was saved. Here the shipwrecked voyagers had remained about ten weeks, when the Mercury, an American three-masted vessel, came in sight, and was engaged to conduct the crew and their property to Monte Video. Having performed this service, the Mercury was purchased by Capt. de Freycinet, and named La Physicienne. The expedition returned to France in November 1820. The place of the shipwreck is shown in Duperrey's 'Plans de la Partie Occidentale de la Baie Française, de la Rivière de Bougainville, et des Ports St. Louis et Duperrey aux Îles Malouines.'

Within a year after his return M. Duperrey submitted to the minister of marine the plan of a new expedition, which was accepted: he was then raised to the rank of lieutenant, and appointed to the command of La Coquille, which, having been armed and equipped at Toulon, sailed thence August 11th, 1822. The Coquille crossed the meridian of Cape Horn January 1st, 1823, and soon afterwards entered the great South Pacific Ocean. After remaining some months among the islands, the expedition passed by the eastern end of New Guinea, and on the 17th of January 1824 cast anchor in Port Jackson,

Australia. Sir Thomas Brisbane, who was then governor of New South Wales, afforded the naturalists the means of exploring the Blue Mountains and the plains of Bathurst. M. Duperrey then set sail for New Zealand, and after a short stay entered again among the islands of the Pacific Ocean. Several islands were discovered, among which was a group which received the name of the Duperrey Islands. M. Duperrey afterwards examined the northern part of New Guinea, traversed the Moluccas, made a short stay at the islands of Mauritius and Bourbon, and then passing round the Cape of Good Hope, reached the port of Marseille on the 24th of April 1825.

The principal results of this important scientific expedition were presented to the public under the title of a '*Voyage autour du Monde, exécuté par Ordre du Roi sur la Corvette La Coquille, pendant les Années 1822, 1823, 1824, et 1825*,' Paris, 1826-30. The historical part consists of text (not completed), 1 vol. royal 4to, with atlas, royal folio, containing 60 coloured plates; Zoology, 2 vols. 4to, and 1 vol. folio (complete); Botany, 1 vol. 4to and 1 vol. folio (not complete); Hydrography, 1 vol. 4to (not complete), and 1 vol. folio (complete). The Zoology is by Messrs. Lesson and Garnot. The Botany is by Dumont d'Urville, Bory de Saint-Vincent, and Brongniart. The Hydrography is by M. Duperrey; and the Physical Sciences, also by him, forms 1 vol. roy. 4to, with maps, exhibiting the terrestrial magnetism, and is complete.

* DUPIN, ANDRÉ-MARIE-JEAN-JACQUES, was born February 1, 1783, at Varsy, in the French department of Nièvre. He is the oldest of three brothers, of whom Baron Charles Dupin is the second, and Philippe Dupin, a lawyer, who was born October 7, 1795, and died February 14, 1846, was the third. The father, Charles André Dupin, was a lawyer and magistrate of eminence, and himself superintended the early education of his sons.

André Dupin, after having been some time in the office of a lawyer, was sent to the Académie de Legislation at Paris, as the pupil elect of the department of Nièvre; and when the schools of law were re-established in 1804, he received from them successively the degrees of licentiate and doctor of laws. In 1810 he failed in a competition for a professorship of law, and thenceforward devoted himself to the bar. In 1813 he became secretary to a commission for the classification of the laws of the empire. In May 1815 he was elected a member of the chamber of representatives, and in the committee of the 23rd of June opposed the proposal to proclaim the young King of Rome as emperor under the title of Napoleon II. In October 1815 he published his '*Libre Défense des Accusés*,' and in November he was united with Berryer in the defence of Marshal Ney. In 1816 he defended the three Englishmen, Wilson, Bruce, and Hutchinson, who were accused of aiding the escape of Lavalette from prison. Among many other instances in which his aid was given to those who were exposed to danger either from party violence or from the injustice of arbitrary power, may be mentioned his eloquent defence of the poet Béranger in 1821, and of the '*Journal des Débats*' in 1829; and so great was his reputation as a sound lawyer that he was scarcely less employed in chamber practice than in public causes.

In 1826 he was elected a member of the chamber of deputies, and he retained his seat till 1842. He was active and influential in the measures of opposition which produced the revolution of 1830. In August 1830 he was appointed procureur-général of the court of cassation, and was called to take part in the first cabinet formed by Louis Philippe. At this period he spoke in the chamber of deputies frequently and energetically, not only for the adoption of liberal measures by the government but against the abuses of liberty by the press and the working classes. On the 21st of November 1832 he was elected president of the chamber of deputies, and he was seven times re-elected. In the same year he was chosen a member of the Académie Française.

When the revolution of 1848 compelled Louis Philippe to abdicate the throne, M. Dupin led the young Comte de Paris into the chamber of deputies, and proposed him as King of the French, with the Duchess of Orléans as regent during his minority. This attempt to stem the tide of republicanism having failed, he yielded to the national will, and retaining his office of procureur-général, obtained a decision of the court of cassation that in future justice should be administered in the name of the French people. Having been elected a member of the Assemblée Constituante he forthwith became actively engaged in the formation of the new government, as president of the commission of regulation, president of the committee of legislation, and member of the constitutional commission. On the 18th of May 1849 M. Dupin was elected a member of the legislative assembly, of which, on the 1st of June following, he was chosen president, and he retained this situation till the assembly was dissolved. The courage, coolness, and firmness which he displayed amidst the tumultuous violence of the factions of that stormy period, were regarded with general admiration. He continued to retain his situation of procureur-général even after the act of December 2, 1851, but resigned it in 1852, on the day after the publication of the decrees confiscating the property of the house of Orléans.

The publications of M. André Dupin are numerous and valuable. They are nearly all on legal subjects. His earliest work was the '*Principia Juris Civilis*,' 5 vols., 12mo, Paris, 1806, and he commenced in the same year his '*Mémoires et Plaidoyers de 1806 au 1er*

Janvier 1830,' 20 vols. 4to. His '*Manuel du droit Ecclésiastique Français*,' 12mo, Paris, was censured by the Congregation of the Index at Rome and by the Archbishop of Lyon, whose mandate against it was suppressed by the French council of state. One of his latest works, and almost the only one not connected with the law, is '*Le Morvan; Topographie, Agriculture, Mœurs des Habitants, État Ancien, État Actuel*,' 12mo, Paris, 1833.

(*Biographie des Contemporains; Nouvelle Biographie Générale.*)

* DUPIN, CHARLES, BARON, brother of André Dupin, was born October 6, 1784, at Varsy, in the department of Nièvre. After receiving his rudimentary education from his father, he was sent in 1801 to the École Polytechnique of Paris. In 1803 he entered the French navy as an engineer. He was employed in 1805 on the arsenal and other defensive works of Antwerp, and afterwards assisted in the works of reconstruction of the harbour of Genoa. In 1808 he proceeded with the squadron which was sent by Napoleon I. to take possession of the Ionian Islands, which were ceded to France in 1807 by the treaty of Tilsit. The squadron returned to France, but Charles Dupin remained at Corfu, where he assisted at the formation of the Ionian Academy, and became its secretary, and also its professor of mechanics and the physical sciences. He left the Ionian Islands in 1811, and after being detained in Italy several months by illness, returned to Paris in 1812. He presented some memoirs to the French Institute, and was elected a corresponding member. In 1813 he was sent to Toulon, where he instituted the Musée Maritime.

After the peace he was sent in 1815 to take charge of the works of the arsenal of Dunkerque, and while there formed the desire of passing over to England, in order to study the great works of construction of that country. His request to be authorised to do this, at his own expense, was at first refused by the French government, but was at length conceded; and in 1816 he commenced his travels and investigations in Great Britain. In these labours, which occupied about twenty months, peculiar opportunities of observation were afforded to him; he received assistance from some of the most distinguished men of science in the country, and he was granted access to a large mass of official documents, many of which were by him for the first time reduced to a popular and comprehensive shape. He returned to France in 1818, but made two or three additional journeys in Great Britain and Ireland before his great work was completed. The publication of the first part was commenced in 1820 under the title of '*Voyages dans la Grande-Bretagne de 1816 à 1819*,' 6 vols. 4to, with atlas, Paris, 1820-24; and also the '*Force Commerciale de la Grande-Bretagne*,' 2 vols. 4to, of which a translation into English was published under the title of '*The Commercial Power of Great Britain*,' exhibiting a complete View of the Public Works of this Country, under the several Heads of Streets, Roads, Canals, Aqueducts, Bridges, Coasts, and Maritime Ports; by the Baron Dupin, Member of the Institute of France; 2 vols. 8vo, with 4to atlas of Plans, Elevations, &c., London, 1825. While the publication of his work was in progress, M. Charles Dupin was made a member of the French Academy of Sciences, received the cross of an officer of the Legion of Honour, and in 1824 was created a Baron. During the same period he was appointed Professor of Mechanics at the Conservatoire des Arts et Métiers, and published his courses of lectures as three separate works, under the titles of '*La Géométrie appliquée aux Arts*,' '*La Mécanique appliquée aux Arts*,' and '*La Dynamie, ou Science des Forces Motrices utiles à l'Industrie*.' He afterwards published '*Géométrie et Mécanique des Arts et Métiers et des Beaux-Arts*,' 3 vols. 8vo, Paris, 1825-26. In 1827 he published the '*Forces Productives et Commerciales de la France*,' 2 vols. 4to, with atlas, and the '*Situation Progressive de la France depuis 1814*,' 4to.

These laborious and useful publications had rendered the name of Baron Dupin so popular that the electors of the department of Tarn in 1828 chose him as their representative in the chamber of deputies, without having ever seen him. He spoke frequently in that session and the following, and in 1830 voted with that majority which changed the dynasty.

After the revolution of 1830 he was elected a member of the chamber of deputies for the department of the Seine, and performed an important part in the debates. In 1831 the king appointed him a councillor of state and a member of the Board of Admiralty, and during four years he was minister of marine. In 1838 he was created a peer of France.

After the revolution of February 1848, Baron Dupin represented the department of Seine-Inférieure in the Constituent Assembly and the Legislative Assembly. He was president of the French jury sent, in 1861, by the minister of commerce to the Great Exhibition of Industry in London. After the coup d'état of December 1851 he resigned his seat at the Board of Admiralty; but when the votes of universal suffrage had sanctioned successively the decennial presidency and the empire, he accepted a seat in the senate.

The following are some of the most important of the later works of Baron Dupin:—'*Essai sur l'Organisation Progressive de la Marine et des Colonies*,' 8vo, Paris, 1834; '*Rapport du Jury Central sur les Produits de l'Industrie Française Exposés en 1834*,' 8 vols. 8vo, Paris, 1836-37; '*Constitution, Histoire, et Avenir des Caisses d'Épargne de France*,' 18mo, Paris, 1844.

(*Biog. Nouvelle des Contemporains; Nouvelle Biog. Générale.*)

DUPELIX, JOSEPH-FRANÇOIS, was born towards the end of the 17th century. His father was a farmer-general of the French revenues and a director of the French East India Company. Intending to form his son for commercial pursuits of the highest kind, he had him educated in mathematics, engineering, and fortification, and in 1715 sent him to sea, and he made several voyages to America and the Indies. The influence of his father procured him the situation of a member of the council at Pondicherry, then the seat of government of the French East India Company in Hindustan, and Duplex landed there in 1720. He remained in this situation about ten years, during which he devoted himself to the business of his office, made himself well acquainted with the commerce of the country, embarked in it on his own account, and realised a large property. Meantime his talents and information pointed him out as the most proper person to superintend the business of the company at their settlement of Chandernagore, on the river Hoogly, about 16 miles above Calcutta. His activity and enterprise soon produced a favourable change on the place; the colonists multiplied, he entered into the country trade, and he and his partners had not less than twelve vessels trading to Surat, the coast of Malabar, the Maldives, the Philippines, and elsewhere. He increased his own property to a very great amount, and during his administration of about ten years, more than 2000 brick-houses were built at Chandernagore, a new establishment for the French company was formed at Patna, and their commerce in Bengal was greatly extended.

The reputation which Duplex had acquired by his administration at Chandernagore pointed him out as the most suitable person to be appointed governor at Pondicherry of all the establishments of the French in Hindustan. To this situation he was accordingly appointed in 1742. The French had at this time another governor in the East Indies, with distinct and independent power, whose seat of government was in the Isle of France (Mauritius), and included the island of Bourbon. This governor was La Bourdonnais, a naval officer of the greatest skill and courage. War having broken out in 1744 between the French and English, La Bourdonnais collected a squadron at Mauritius, with which the English ships off the coast of the Carnatic were unable to contend; he then landed a body of troops, September 14, 1746, and compelled Madras, at that time a settlement of the English, to surrender; but entered into a treaty to restore it on the payment of a stipulated sum. This was in accordance with direct orders from the French government, who did not at that time deem it prudent to extend their territory in Hindustan. Duplex however was of a directly opposite opinion, and he refused to abide by the terms of the capitulation. This led to violent disputes between Duplex and La Bourdonnais, the result of which was that La Bourdonnais was recalled home, and Duplex retained Madras, and plundered it. He afterwards made three or four attempts, but without success, to capture Fort St. David, another English settlement on the Coromandel coast, about twelve miles south from Pondicherry. As it was the main object of Duplex to expel the English from Hindustan, or at least from its eastern coast, and he was unable to accomplish it by his own troops, he entered into various intrigues with the native princes, especially with the soubahdar or viceroy of the Deccan, and the nabob of the Carnatic. The conflicts between the French and English, each supported alternately by the native rulers, continued till 1764. In that year a conference was held in London between agents appointed by the French and English East India Companies, and attended also by a minister from each government. By a decision of this conference Duplex was recalled to France, and M. Godheu, who superseded him in the government of all the French possessions in Hindustan, landed at Pondicherry on the 2nd of August. Duplex, after his return to Paris, in vain endeavoured to obtain repayment of vast sums of money which he had expended on account of the East India Company, and after a series of unsuccessful law-suits, died of grief. Voltaire, 'Précis du Siècle de Louis XIV.,' ch. 39, says, "Il en mourut bientôt de chagrin."

DUPONCEAU, PETER S., LL.D., was born in the Île de Rhé, in France, about 1760. He went early to the United States of North America, served in the army, and afterwards in the office of the secretary of state. He subsequently practised for some years at the bar, but quitted the law for literature. He was a member of several literary societies, and in 1828 became president of the American Philosophical Society. In 1835 he gained the Volney prize at the Institute of France by a 'Mémoire sur le Système Grammatical des Langues de quelques Nations Indiennes de l'Amérique du Nord,' which was printed in 8vo at Paris, in 1838, under the care of M. J. B. Eyriès. This 'Mémoire' contains an account and examination of the languages of what the author denominates the Algonquin races, or the tribes calling themselves the Chippeways, or Ojibbeways. Among the other works of Duponceau are:—*'A Dissertation on the Nature and Extent of the Jurisdiction of the Courts of the United States,'* 8vo, Philadelphia, 1834; *'A Brief View of the Constitution of the United States,'* 8vo, Philadelphia, 1831; and *'A Dissertation on the Nature and Character of the Chinese System of Writing,'* 8vo, Philadelphia, 1838. The object of this last work is to refute the common notion that the Chinese written characters do not in any sense represent words, but only ideas, and the inference thence deduced, that they

may be read and made use of by other nations who do not understand the Chinese spoken language—as for instance by the Japanese and Koreans. This able man, whose works are all, as far as we have examined them, marked by careful research and sound information, as well as by just and independent thinking, died at Philadelphia on the 2nd of April 1844.

DUPONT DE L'EURE, JACQUES-CHARLES, was born at Neubourg, département de l'Eure, on the 27th of February 1767. He was an advocate, practising in Normandy, when the revolution began in 1789, and was made a judge in one of the law-courts of Louviers in 1792. In 1798 he was a member of the Council of Five Hundred, and on the 18th Brumaire was driven out by the bayonets of Murat. He belonged to the Corps Legislatif in 1818, and the following year was elected a deputy of the new Chamber. During the governments of Louis XVIII., of Charles X., and of Louis Philippe, he attached himself without deviation to the cause he had first adopted of constitutional reform, and on more than one critical occasion took the lead of the liberal party. After the revolution of July 1830, Dupont de l'Eure became a commissioner of the law in the provisional government in his own department, and soon after, yielding to the entreaties of Laflotte, he accepted the office of Minister of Justice; but his principles and want of flexibility were suited neither to his colleagues nor to his sovereign, so that he resigned his portfolio on the 27th of December 1830, and resumed his place in the ranks of the opposition. After the fall of Louis Philippe in February 1848, Dupont de l'Eure became, against his own wish, a member of the provisional government. He died in 1855, at the age of eighty-eight. A firm but by no means a violent republican, he was generally respected as a consistent and honest politician.

* **DUPONT, PIERRE**, was born at Lyon, in France, April 21, 1821, the son of a labouring people. He was educated by his godfather, a priest, and very early began to write songs, which he also sang. He attracted notice, and in 1844 a volume of poems was published by subscription, entitled 'The Two Angels.' He then went to Paris, and obtained a place in the office of the secretary of the Institute. He continued to pour forth songs, most of them vividly descriptive of the scenes and feelings of country life, with a freshness, a strength, and a simplicity, that remind us of some of the best of our English lyrical peasant poets. He did not however confine himself to rural subjects. He wrote many political songs in favour of republicanism, which became extremely popular: one was 'The Song of Bread,' written in 1848; another was 'The Song of the Workers.' On the coup-d'état (December, 1851) taking place he was arrested, but was released in consequence of the strong intercessions in his favour.

DUPUIS, CHARLES-FRANÇOIS, was born of poor parents, at Fryé-Château, between Gisors and Chaumont, on the 26th of October 1742. His early instructions were due to his father, who, though in very humble circumstances, appears to have been a man of some learning and considerable intelligence; and the early turn of mind in young Dupuis was very decidedly to mathematics and astronomy. It was his good fortune to become known while yet a boy to the Duc de Rochefoucauld, who procured him an exhibition to the college of Harcourt. His studies here took a new direction, and he made such rapid progress in them as to secure the highest opinion of the professors of the college, and give promise of distinction in future life.

Before the age of twenty-four, he was appointed professor of rhetoric in the college of Lisieux; and having sufficient leisure allowed him by his duties, he completed his course of law studies, and in 1770 was admitted an advocate of the parliament. Being directed by the rector of his university to pronounce the discourse on the distribution of the prizes, this led also to his being nominated to deliver the funeral oration, in the name of the university, on the queen Marie-Thérèse. With these his literary reputation commenced, and they are considered good specimens of purity and elegance in Latin composition.

The nature of his literary pursuits again led him into contact with the subjects of his early study; and profiting by the lessons and the friendship of Lalande, he entered upon the study of astronomical history with a zeal which never abated to the close of his life. His attention was especially directed in the first place to the probable signification of the astronomical symbols which constituted the signs of the zodiac; and thence to all the other ancient constellations. His active mind however even in the midst of these deeply interesting speculations, was alive to other objects; and among his amusements was the construction of a telegraph, founded on the suggestions of Amontons, by means of which, from 1778 to the commencement of the Revolution, he carried on a correspondence with his friend M. Fortin, who was resident at Bagneux, he himself being located at Belleville. This mode of correspondence he however very prudently laid aside, lest it should lay him open to suspicion from the factions that then governed France.

In 1777 and 1778 he published in the 'Journal des Savans' the first sketches of the theory at which he had arrived; and shortly after, both in the astronomy of his friend Lalande, and in a separate 4to volume under the title of 'Mémoire sur l'Origine des Constellations et sur l'explication de la Fable par l'Astronomie,' 1781. The sceptical tendency of the views entertained by Dupuis led Condorcet to recommend him to Frederick the Great, as professor of literature

in the College of Berlin, and successor to Thiebault; and the offer was accepted by Dupuis. The death of Frederick however prevented the arrangement from being carried into effect; but the chair of Latin eloquence in the College of France becoming then vacant by the death of Bejot, he was appointed to fill it. In the same year (1778) he was named a member of the Academy of Inscriptions, and was appointed one of the four commissioners of public instruction for the department of Paris. The danger of his residence in the capital now induced him to seek a retreat at Evreux. He was, notwithstanding his retirement, named member of the Convention for the department of Seine-et-Oise; and was remarkable for the moderation of his views. Caution was the characteristic of his political career. In the year II. he was elected secretary of the Assembly; and in the following year a member of the Council of Five Hundred. He was elected one of the forty-eight members of the French Institute, though after much determined and discreditable opposition from the ultra-revolution party. On the 18th Brumaire, year IV., he was elected by the department of Seine-et-Oise their member of the legislative body, and soon after president of that assembly, and ultimately was nominated a candidate for the senate. Hopeless of the regeneration of France, he retired at once from public life, and devoted the remainder of his days to the investigations of the questions which arose out of his early speculations. We have hence to trace his progress only as a man of letters and a man of science, and to give some general idea of the views which are contained in his several works.

On the publication of the '*Mémoire sur les Constellations*' a new course of erudite inquiry was opened; and though the arguments and conclusions were contested by Bailly, he gave Dupuis full credit for the ability and learning displayed in the work. He afterwards renewed his researches, and made them the subject of a course of lectures delivered from his chair in the college of Lisieux. In 1794 he published his great work entitled '*Origine de tous les Cultes, ou la Religion Universelle*', 3 vols. 4to, with an Atlas; and also, slightly abridged in one of its parts (the '*Justification*'), in 12 vols. 8vo. This work gave rise to much discussion, often conducted with a sectarian bitterness little creditable to philosophical or theological investigation. In 1798 he published an abridgment of the '*Origine*' in one vol. 8vo, or rather a series of extracts from his large work, under the same title; but a much more methodical abridgment was shortly after given to the world by Destutt-de-Tracy.

The wildly-displayed hatred towards Christianity which so strongly developed itself during the eventful period of the French Revolution was well calculated to create deep interest in the work of Dupuis. He had been led to conclude that the earliest traces of the general mythology of the southern climates would be found in Upper Egypt, if indeed they had not their origin there. In this celebrated work therefore originated the '*Commission*' to explore the ruins of that country, which was undertaken by Napoleon after his return from Italy. Nothing indeed can show so clearly the influence which this work had exercised over the '*regenerated nation*,' as that the most ambitious of all the men of his time should leave the scene of the most glittering hopes to a daring spirit like his, to lead an expedition such as this. Out of that expedition what new and unexpected results have arisen! The very phraseology of history has been changed; and the sacred rites and domestic manners of ancient Egypt are now scarcely, if at all, less understood than those of Greece and Rome.

The Zodiac of Tentyra (or Denderah) engaged much of the attention of Dupuis, upon which he published a *Mémoire* and an Explication, in the '*Revue Philosophique*' for May 1806, which he afterwards published in an enlarged and separate form, in 1 vol. 4to, under the title of '*Mémoire explicatif du Zodiacus Chronologique et Mythologique*'. In this curious dissertation he compares the Greek and Egyptian zodiacs with those of the Chinese, the Persians, the Arabs, and all the others of which he could obtain any distinct notices. He afterwards read to his class of the Institute a '*Mémoire sur le Phénix*,' which, as he contended, signified the reproduction of the cycle of 1461 common (vague) Egyptian years. In the '*Nouvel Almanach des Muses*' for 1805 he also published a fragment of the poem of Nonnius; it is indeed said that his astronomical system was suggested by this poem originally, and it is certain that his '*Origine des Cultes*' is but a voluminous commentary on the ideas contained in that poem.

Dupuis died at Is-sur-Tille on September 29, 1809, aged sixty-seven. He was a member of the Legion of Honour. He was a man of strict probity, and much esteemed by his friends for his personal qualities. He amassed no fortune, being satisfied to expend his income upon the materials for his researches.

He left in manuscript a work on Cosmogonics and Theogonics, intended as a defence and illustration of the doctrines of the '*Origine des Cultes*.' In this work Leblond considered that Dupuis had at last discovered the interpretation of the Egyptian hieroglyphics—a conclusion that few, since the researches of Dr. Young and Champollion, will feel disposed to admit. There is also reason to believe that it was in consequence of conversations with Dupuis that Volney composed his celebrated work on the '*Ruins of Empires*.'

Dupuis has been often stigmatised as a paradoxical writer. Bold and speculative he was, but there is certainly little cause to call him paradoxical. His conjectures are often plausible, though his deduc-

tions from them are frequently inconsequential. Whatever might have been the immediate effect of his scepticism, there can be little doubt that the ultimate effect has been alike favourable to early history and to the Christian religion. He was a sincere and candid man, and always appeared to be fully impressed with the truth of the conclusions at which he had arrived. It was indeed that earnestness of character that gave so much weight to his opinions and so much influence to his suggestions. Had this feature been wanting in the character of Dupuis, the expedition to Egypt would never have been undertaken, nor consequently would the brilliant discoveries to which it finally led have been made.

DUPUIS, THOMAS SAUNDERS, Mus. Doc., the composer of much good music for the chapels-royal, and a very distinguished organist, was born in London in 1733, and received his education in the royal chapel, of which he became organist and composer on the death of Dr. Boyce in 1779. In 1790 he was admitted to the degree of Doctor in Music by the University of Oxford, and died in 1796. After his death a selection from his works was published in two volumes, by his pupil, John Spencer, Esq., nephew and son-in-law of the Duke of Marlborough; but many of his best productions still continue in manuscript, and remain buried in the books of the king's chapel, among several other compositions of undisputed merit.

DUPUYTREN, GUILLAUME, LE BARON, was born at Pierre-Buffière, a little village of the department of Haute-Vienne, in France, on the 5th of October 1777. His parents were poor, and at the age of three years he was stolen from them by a lady of rank, who wished to adopt him as her son. He was however returned to his parents, and received his early education at the college of Magnac-Laval. During one of his college vacations, whilst he was playing in his native village when a troop of cavalry passed through, one of the officers was much struck with the appearance of young Dupuytren, and being pleased with his answers to his questions, obtained his own and his parents' consent to take him with him to Paris, and to educate him. The officer had a brother in the Collège de la Marche, under whose care Dupuytren was placed. Here he had a brilliant career, and determined on pursuing medicine as a profession. He commenced the study of pharmacy under Lagrange and Vauquelin, and also attended the dissecting-room. He is described at this time as occupying a room with a fellow-student, the furniture of which consisted of three chairs, a table, and a sort of bed on which the friends alternately reposed; and their means were so scanty that they were obliged to live on bread and water. During this period he always commenced his work at four o'clock in the morning.

In the month Frimaire of the year III. of the republic of France (the end of 1794), a new school of medicine was formed in Paris under Fourcroy. The office of prosector, as well as the chairs of the professors, were given by concours; for one of these positions Dupuytren contended, and was placed first on the list. His emolument was barely sufficient to keep him in health. In 1801 he contended with M. Dumeril for the position of chef des travaux anatomiques, which he lost by one vote; but a few months after, Dumeril having been appointed to a professorship, the place was given to Dupuytren.

Up to this time morbid anatomy had only been pursued in the same manner as descriptive anatomy. Little had been done towards regarding the appearances of bodies after death as the result of certain definite actions in life; and the facts recorded by Bartholin, Bonet, Manget, Morgagni, and Lieutaud, had never been systematised, nor any general principles deduced from them. Dupuytren saw this, and devoted himself with ardour to pathological anatomy. He however determined to connect this branch of inquiry with surgery. The results of his labour were not however published by himself, as indeed very little that he has done has ever been, but appeared in a work by M. Marandel, entitled '*Essai sur les Irritations*,' Paris, 1807. In this work the organic lesions of the body are distributed into species, genera, orders, and classes; and although the work contains many errors of observation, and much hasty generalisation, it must be regarded as a successful effort towards forming a science of morbid anatomy.

In 1803 Dupuytren took his degree in the faculty of medicine. On this occasion he wrote a thesis on some points of anatomy, physiology, chemistry, and pathological anatomy. This thesis contained important statements of facts and deductions. The principal subjects were, the structure of the various canals of the bones, the use of the lateral ligaments, the nature of the chyle, and the nature of the morbid formations called false membranes. It was published in Paris in 1804. In 1803 a society was constituted in the faculty of medicine for the purpose of discussing and publishing papers on medical subjects. From 1804 to 1821 this society published seven volumes, under the title '*Bulletin de la Faculté de Médecine de Paris, et de la Société établie dans son sein*,' 8vo. The bulletins were drawn up by Merat and Dumeril, and contain a great number of reports and memoirs which had been communicated to the society by Dupuytren. Among the most important were papers on the influence of organic lesions on health; a description of several monstrous fetuses; description of two children, one a dwarf, the other a giant; and on the cause of death in drains and cess-pools. The result of his researches on this last subject led to important alterations in the construction of drains, &c., so as to secure a more perfect ventilation, and thus the frequent

occurrence of death amongst the workmen has been prevented. In his researches on this subject he was assisted by Thénard the chemist, who was his intimate friend. Thénard also assisted him at this time in some researches upon the nature of diabetes mellitus. Although the surgeon and the chemist arrived at no satisfactory conclusions with regard to this disease, they observed and recorded many important facts. The result of their investigations was published in the 'Bulletin' for 1806.

In the year 1803 the office of assistant-surgeon at the Hôtel-Dieu was given to Dupuytren after examination by public concours. In 1811 Sabatier died, who had long filled the chair of surgery with the highest reputation. The concours for this office took place in 1812, when Dupuytren, Roux, Tartra, and Marjolin were the candidates. The examination consisted of written replies to certain surgical and anatomical questions, a defence by each of the candidates of his own particular positions, operations upon the dead body, and a thesis. Dupuytren was successful. The subject of the thesis was the operation of lithotomy. That presented by Dupuytren was published in Paris, with the title 'De la Lithotomie: Thèse présentée au Concours pour la Chaire de Médecine Opératoire,' 4to. In 1815 he was transferred to the chair of clinical surgery, which he held till his death. In 1818 he was advanced to the post of senior surgeon to the Hôtel-Dieu.

Although it would be difficult to point out a single department of surgery or morbid anatomy on which the views, opinions, and observations of Dupuytren are not known, yet he has left no record of these in works written by himself. During the twenty years however that he held the office of professor of clinical surgery at the Hôtel-Dieu, his lectures were published in the various French medical periodicals, and many courses have been also published in the English medical periodicals. A collection of them was published in Paris by a society of young medical men, under the title 'Leçons Orales de Clinique Chirurgicale, faites à l'Hôtel-Dieu de Paris, par M. le Baron Dupuytren, recueillies et publiées par une Société de Médecins,' 1832, 8vo. This work extended to four volumes, and embraces the views of Dupuytren on most of the important points of surgery. His views on morbid anatomy have been fully given by Roche and Sanson in their great work on medico-surgical pathology, entitled 'Nouveau Eléments de Pathologie Médico-Chirurgicale,' 5 vols. 8vo, Paris, 1833. In the 'Répertoire d'Anatomie' of Breschet and Royer-Collard, and the 'Médecine Opératoire de Sabatier' of Sanson and Béguin, the surgical and pathological views of Dupuytren have found faithful reporters.

The improvements introduced by Dupuytren in the treatment of surgical diseases were always founded on his great anatomical and pathological knowledge, and modern surgery owes much of its success to his exertions. One subject to which he turned his attention was artificial anus, and he proposed an operation in this painful state which has been perfectly successful. On this subject he presented a memoir from his own hand to the Académie Royale de Médecine. It was published under the title 'Mémoire sur une Méthode Nouvelle pour traiter les Anus Accidentels.' Besides this, and the papers before referred to, the following subjects on which he wrote are amongst those which have distinguished him both as a pathologist and surgeon:—On the Nerves of the Tongue; on the Motions of the Brain; on the Function of Absorption; on the Influence of the Eighth Pair of Nerves; on Amputation of the lower Jaw-bone; on the Ligature of Arteries; on Fracture of the Fibula; on Congenital Dislocations; on Retraction of the Fingers.

In the department of practical surgery he was eminently successful; he possessed almost entire control over his feelings; and with great anatomical knowledge, accuracy of perception, and perfect steadiness of manipulation, his operations were regarded as the most successful of the surgical staff of the Parisian hospitals. His presence of mind never forsook him, and the difficulties and accidents which must sometimes occur in operative surgery were always made subservient to the instruction and guidance of the pupils. During his career as an operative surgeon he invented many instruments. Amongst these is the enterotome, with which the operation for artificial anus is performed, and which has rescued many victims from the grave. Other instruments of his invention are—a double-bladed bistoury, for the bilateral operation for stone in the bladder; a cataract-needle; a compressor in cases of hemorrhage; a porte-ligature; and others.

His performance of his duties, as surgeon and clinical teacher, was remarkable. Although he had one of the largest private practices in Europe, and accumulated through it probably the largest fortune ever made by a medical man, he never neglected his public duties. He spent from four to five hours every morning in visiting his patients at the Hôtel-Dieu, performing operations, making post-mortem examinations, giving clinical instruction, and in consultations. Every evening he returned to the hospital at six, for the purpose of visiting the worst cases and performing urgent operations. These severe duties he never intermitted even during sickness, and when suffering from attacks of disease. These labours however at last told upon even his iron constitution, and in November 1833 he first gave symptoms of decay. On the 5th of that month he was seized with a slight attack of apoplexy, which lasted only a short time, but left behind it a difficulty of speaking, as well as an inclination of the mouth towards the right

side. He still continued his duties at the Hôtel-Dieu, but his friends at last persuaded him to make a journey to Naples. He remained in that city till May 1834. He resumed his visits and lectures at the hospital, and struggled on till February 1835. He died on the 8th of the same month. He retained his intellectual faculties to the last, and, aware of his approaching end, wished that the medical paper might be read to him the evening before he died, "in order," as he observed, "that he might carry the latest news of disease out of the world." He however repudiated the suggestion that he was a sceptic in religion, and received, previous to his death, the last sacrament of the Roman Catholic Church.

In his will he left the bulk of his enormous fortune, amounting to 280,000*l.* to an only daughter. He also left 200,000 francs for the purpose of endowing a chair of pathological anatomy. This sum being found larger than was necessary to endow merely the chair, a certain portion of the income has been appropriated to maintaining in connection with the chair, a museum of pathological anatomy, which is called the Musée Dupuytren. He left his body, to be carefully examined, to his two friends Messrs. Broussais and Cruveilhier, who published a minute account of the post-mortem examination. He was buried in the cemetery of Père-la-Chaise, on the 10th of February. The funeral was attended by all the professors of the faculty, and deputations from the Academy of Medicine and the Institute, and the funeral car was drawn by students from the church to the tomb. Orations were delivered at the grave by Messrs. Orfila, Larrey, Bouillaud, Royer-Collard, and Tessier.

Although Dupuytren will ever be remembered as a clever and a brilliant operative surgeon, it is not on this that his reputation rests. It was the scientific character that he gave to his clinical instruction that placed him far above those who had preceded him, and which led to the cultivation of surgery upon principles founded on physiological and pathological inquiries, rather than on rules founded on the practice and authority of previous writers. If he left no great works by which to judge of the value of his labours, he yet raised up a body of enlightened practitioners of surgery in France, who in their numerous writings have ever been anxious to acknowledge Dupuytren as their master. His personal character commanded little respect and won no esteem; he was cold, cynical, selfish, and intolerant.

(*Lancet*, vol. i. 1834-35; *Eloge du Baron G. Dupuytren*, par E. Pariset; *Revue Médicale*, 1835; Callisen, *Medicinisches Schriftsteller Lexicon*; and notices of Dupuytren by Salgues, Vidal de Cassis, Brive de Boismonet, Cruveilhier, Bardinot, &c.)

*DURAN, DON AGUSTIN, a Spanish critical and miscellaneous writer of great influence and reputation, was born at Madrid towards the close of the 18th century; we are not told by his biographers in what year, but as he was admitted to practice as an advocate in 1817, and the legal age for such admission is in Spain fixed at twenty-four, the date of his birth cannot be later than 1793. He lost his mother early; his father, who was physician to the royal family, was unable to send him to the usual places of education on account of his ill-health, to which he was from childhood a martyr. At Vergara, to which he was sent for the benefit of the country air, he went through a course of reading such as his own pleasure dictated, the old romances, the story of the Cid, and the comedies of Calderon and Moreto, and when he returned to Madrid he had completely forgotten what Latin and mathematics he had learned. He was also such a firm believer in ghosts that, to cure him, his father found it necessary to make him go through the discipline of attending a course of dissections. Under the guidance of Manuel Quintana, the poet, and Alberto Lista, the literary historian, both friends of the elder Duran, and both, till very lately, still living friends of the younger, he soon recovered his lost ground, and if we may believe his Spanish biographers, made such progress in metaphysics as to "comprehend easily the works of Kant and his disciples," but as in the last work that Duran has published he avows himself to be utterly unacquainted with German, their statements seem to require modification. Though admitted an advocate he never appears to have pursued the law, but to have occupied himself with politics and literature. In 1821 he obtained an appointment in the "Dirección general de estudios," or department of public instruction, which he lost in consequence of his political opinions being of a liberal cast, on the French invasion of 1823; in 1834 he was named secretary of the board for the inspection of printing-houses, and soon afterwards one of the secretaries of the national library at Madrid. In the 'Galería de Españoles Celebres,' it is said that he was the principal librarian, but this appears to be a mistake; in the 'Catalogo del Museo de Antigüedades,' by Castellanos de Losada, himself an official of the library, it is stated that the then principal librarian was Patiño, author of 'El Bibliotecario,' and that Duran, who was dismissed for political causes in 1840 and re-appointed in 1843, is now the elder librarian (Bibliotecario decano) and second in rank, the first being Breton de los Herreros, the noted dramatist.

The first work by which Duran became known was his essay 'On the influence which modern criticism has exercised on the decline of the Spanish drama, and the manner in which that drama ought to be considered to form a proper estimate of its peculiar merits,' Madrid, 1828. In this production, which contained much that was novel to the Spanish reader, but much that was otherwise to those acquainted with the writings of Schlegel, Duran, who had for a short time been

induced to submit to the now antiquated French school of criticism, returned to his youthful allegiance to Calderon and Lope de Vega, and contended for the principles of æsthetics, to which the epithet of 'romantic' has been generally applied. His book came exactly at the right moment. A complete revolution has taken place in the state of the Spanish drama, mainly produced by this work of Duran, and by the encouragement which he gave in society to the young authors who showed a disposition to adopt his principles, and undoubtedly the most brilliant epoch in its history since the time of Canizares is that of the last quarter of a century. His next step was also one that had been suggested by the example of the Germans. He published in 1828 a 'Romancero de Romances Moriscos,' or collection of the old Spanish ballads on Moorish subjects, on the plan of that of Depping. Duran remarks in his preface on the attention that had been paid of late years to the elder Spanish literature in Germany, France, and England, and observes that in a short time the Spaniards would have to go to foreign libraries to study the works that belonged to themselves. The observation is so true, that of the materials for recent collections of Spanish ballads, some are to be found only at Prague and some at the British Museum. The success of Duran's 'Romancero' was great, and it was followed up in subsequent years by 'Romanceros' on other subjects and other collections by the same editor, till a series was formed which was indispensable in every good Spanish library. In 1849 and 1851 he re-edited the whole of the ballads as a portion of the extensive 'Biblioteca de Autores Españoles,' issued at Madrid by Aribau and Rivadeneyra, the greatest and most useful undertaking that has been ventured on for the last century by a Spanish publisher. The new edition is called 'Romancero General,' or Collection of Spanish ballads anterior to the 18th century, corrected, arranged, classified, and annotated by Don Agustin Duran, and occupies two volumes of more than 600 pages each, closely printed in double columns. In the prefaces the author does not forget to acknowledge his obligations to foreign critics who have treated of the subject, in particular to Ferdinand Wolff of Vienna, and in bibliographical notices appended he treats in full of all previous collections of the ballads in a way to supersede all bibliography on the subject of an earlier date. Duran has written several but not numerous articles in various periodicals on literary topics, in particular one in the 'Revista de Madrid' on 'Lope de Vega.' Some years ago he commenced the publication of what was intended to be an extensive collection of the old Spanish comedies, with critical remarks, but it was dropped in a short time for want of encouragement, after a few numbers of 'Tirso de Molina' had been issued. He has completed in manuscript a history of the Spanish theatre from its origin to the middle of the 18th century, including a bibliography of all the plays extant, which is likely when it appears to supersede even the valuable history by Schack. In poetry he has been chiefly successful in producing excellent imitations of the older Spanish writers, with all the peculiarities of their antiquated language applied to modern events, the marriage of Queen Christina, &c. As a political writer he manifests, like many other writers of his country, an exaggerated notion of its importance, and what seems to an Englishman a very inadequate notion of the services rendered to it by England in the Peninsular war: thus he concludes a violent philippic against England by the observation that "Spain has almost always been the shield of Europe, almost always it has repressed social catastrophes, and always Europe has been ungrateful." Don Agustin is a knight of the order of Carlos III., which he received in 1838, and a member of the Royal Spanish Academy.

DURAND, JEAN-NICOLAS-LOUIS, Professor of Architecture at the École Polytechnique, was born at Paris, September 18, 1760. His father was a shoemaker in very poor circumstances, but young Durand had the good fortune to find a patron in a benevolent individual, who, having been struck by the boy's natural cleverness, offered to defray the expense of his education. He was accordingly placed in the Collège Moutaigne, where, though he quitted it much sooner than was intended, owing to the strictness of the discipline there, he imbibed a taste for classical studies which he continued to cultivate. On leaving college, a sculptor who had seen several sketches and drawings by him proposed to take him (then about the age of fourteen) as his pupil. But his progress did not answer the expectation of his instructor, all his leisure time and voluntary studies being given to architecture. His first benefactor being informed of his passion for architectural studies, recommended him to Panzeron the architect (author of 'Éléments d'Architecture,' Paris, 1772), under whom his advance was exceedingly rapid. In about two years he became draftsman to Boulée, the king's architect, who was so delighted with his assiduity and ability, that he several times offered to raise his salary, and when he refused to accept any advance, afterwards settled an annuity upon him, which he received till his death. While with Boulée, he also attended some of the courses of instruction at the Académie Royale d'Architecture, where he in 1780 obtained the great prize, the subject being a design for a college adapted to a site whose shape was an equilateral triangle. About a dozen years later, the demand on the part of the National Convention (1798) for designs for public edifices of utility or embellishment, proposed to be erected in various parts of France, afforded Durand and Thibaud (who had become strongly attached to each other while both were with Boulée) an opportunity of displaying their talents upon a variety of subjects.

They produced conjointly eleven different designs, of which four obtained the great prize, and are published in Detournelle's collection of 'Les Grands Prix.' After this, though the friendship between Durand and Thibaud continued unabated, they ceased to practise in concert with each other. In fact Durand, on being appointed to the professorship at the newly-founded École Centrale des Travaux Publics, afterwards the École Polytechnique, which he held for forty years, gave himself up almost entirely to its duties, and to the self-imposed task of providing works of instruction for the pupils and the profession in general. Of these the most celebrated as a 'show-book,' is the 'Recueil et Parallèle des Edifices de tous Genres,' 1800, consisting of eighty-six plates of oblong or double folio size, and forming a sort of historical gallery or museum of architecture. Yet though interesting as facilitating a general view of the subject, and affording a comparison of different buildings drawn to the same scale, its real usefulness is by no means so great as it at first seems. Notwithstanding the size of the volume, which is such as to render reference to it very inconvenient, there are so many different subjects upon the same plate that they are necessarily upon a very inadequate scale, and some of them so small, that they might have been larger even on a duodecimo page. In other respects too they are far from being shown satisfactorily, there being seldom more than a mere general plan and elevation of each; besides which the collection is little other than a compilation of all the most celebrated, consequently the most generally known buildings. Thus, without being sufficiently popular in form and matter for the mass of the public, the work is too general in its nature for professional study except as a synopsis of the subject, and a sort of catalogue raisonné. A new edition was published a few years back, in which were several new plates, but they consist for the most part of subjects taken and reduced from the works of Schinkel, Klenze, and other architects. The 'Recueil' itself contains no text, but Legend's 'Essai sur l'Histoire Générale de l'Architecture' was published as an accompaniment to it in a separate octavo volume. Durand's other work, the 'Précis des Leçons d'Architecture,' 2 tom. 4to, is generally considered a valuable one of its kind, yet has been objected to as seeking to establish formal mechanical rules that are rather derogatory from true art. Accordingly, though greatly commended by some, his 'interaxal system' of laying out a plan by first dividing the whole of it into a number of squares, determined by the intercolumniation adopted for the order, if there be one, has been denounced by others as a dull and plodding process, calculated only to produce wearisome monotony of arrangement, and to cramp the imagination. There is another publication by him entitled 'Précis Graphique des Cours d'Architecture,' &c., 4to, Paris, 1821. Durand died at Thiais, in the neighbourhood of Paris, December 31st, 1834.

DURANTE, FRANCESCO, a celebrated Italian composer, was born in Naples in 1698, and educated under Alessandro Scarlatti. His works are not numerous, and chiefly of the sacred kind. They are said to be sweet yet solemn in style, but wanting in brilliancy. He is now best remembered as the master of Pergolesi, Piccini, Sacchini, Paisiello, &c., who received instructions from him at the Neapolitan Conservatorio of St. Onofrio, and the Poveri di Gesù Cristo, of both of which Durante was the principal.

DÜRER, ALBRECHT, or ALBERT, born at Nürnberg on the 20th of May 1471, was the son of a skilful goldsmith, and received that sound education which the wealthy burghers of the free towns of Germany were accustomed to give to their children. In all branches of instruction Albrecht made great progress, and showed also much ingenuity in the profession for which he was intended; but his genius being bent towards a nobler art, to the great vexation of his father, he gave up the working of gold, and placed himself under the most able painter of his native country, Michael Wohlgemuth (1486). After finishing his apprenticeship he set out on his travels, and in 1490 went through Germany. On his journey he painted portraits and other pictures, which were highly admired. Improved by experience, and with increased reputation, he returned home in 1494, and soon after executed his masterpiece, as it was called, a drawing of Orpheus. It was the custom of those times for a painter in Germany, in order to be received and acknowledged as a master, to exhibit a piece which merited the approbation of his teacher and of the other masters of his craft. When this was accomplished, the candidate received a kind of diploma, and was entitled to the honours and rights of a master.

After obtaining the mastership Dürer visited Holland and Italy, where he executed some of his best pictures, such as the 'Martyrdom of St. Bartholomew' for the church of St. Mark, and 'Adam and Eve' for the German church in Venice, which was afterwards bought for the Gallery of Prague. In Bologna he became acquainted with Raffaello, who esteemed him highly. In token of their friendship, each presented the other with his portrait. He returned home in 1507, with the reputation of being the first painter of his country. "Certainly," says Vasari ('Vite de' Pittori'), "if this diligent, industrious, universal man had been a native of Tuscany, and if he could have studied as we have done in Rome, he would have been the best painter in our country, as he was the most celebrated that Germany ever had."

His productions were indeed so highly valued as to attract the notice of the most powerful sovereigns of his time, Maximilian I. and

Charles V., who appointed him their painter, and bestowed upon him riches and honour.

To please his father, Dürer had married, against his inclination, the daughter of a wealthy neighbour; but the match turned out so unfortunate that it embittered his life, and his countrymen attributed his premature death to his domestic misfortune. He died in 1528, in the fifty-eighth year of his age. The senate of Nürnberg, to honour the memory of their illustrious citizen, decreed him a public funeral, which was celebrated with great pomp and solemnity.

Dürer was the first man in Germany who taught the rules of perspective and the proportions of the human body according to mathematical and anatomical principles. In fact, his works were in this respect so classical, that even his prints and wood-cuts were purchased by the Italian painters for their improvement in those branches.

His paintings are admired for the vivid and fertile imagination, the sublime conception, and the wonderful union of boldness and correctness of design which they display. Some critics have found fault with the unnecessary, or, as it has been termed, ostentatious correctness of drawing and the exuberance of his imagination; but the only fault that can be really objected to in him is his total neglect of costume. Yet the censure of this fault arises from his adopting a conventional costume, which is contrary in its character to that of the great Italian masters, rather than from the costume being untrue. His costume certainly appears faulty enough, but the fault is that it is over-elaborate rather than neglected. His pictures, in spite of this violation of the rules of taste, produce lasting impressions of the sublime and beautiful; and impartial judges must always honour in him the greatest master of the old German school.

Besides his great historical paintings, the best of which are in the collections of Vienna, Prague, Munich, and Dresden, Dürer has left some landscapes that are highly valued. Dürer's portraits were also highly esteemed: it was said of him that he not only possessed the talent of catching the exact expression of the features, but also of delineating the different characters and passions. Dürer was also an excellent engraver in copper and wood; his wood-cuts are masterpieces of the art, and considered equal to those of Hugo da Carpi. The best among his wood-cuts, both in respect of invention and execution, are his greater 'Passion' and his 'Revelation of St. John.' So much were they sought after, even during his lifetime, that a Venetian artist was induced to counterfeit them. When Dürer heard of this forgery he went to Venice and commenced a suit against the man, whose name was Marc Antonio Franci. The senate of Venice would have punished the offender severely if Dürer had not obtained his pardon. There is a volume containing more than 200 original drawings by Albert Dürer in the print-room of the British Museum, which formerly belonged to the collection of Sir Hans Sloane, and was probably part of the celebrated collection of Dürer's friend, W. Pirckheimer. In the same room is preserved an exquisite carving by him, in hone-stone, of the 'Birth of St. John,' bequeathed to the museum by Mr. R. P. Knight, who had purchased it at the price of 500*l*. It is dated 1510.

An extensive collection of Albert Dürer's engravings was bequeathed to the British Museum by the sculptor Nollekens, and many have since been purchased. It is a matter of great regret that there is not a single painting by Dürer in the National Gallery. The Dürer engravings in the British Museum are of course, under present arrangements, not open to public inspection; though it certainly appears very desirable that a selection of the magnificent collection of drawings and engravings now in that museum should be shown to the public, and the exhibition of the Raffaele drawings in the Taylor Buildings at Oxford proves that it is perfectly practicable.

Two inventions are attributed to Dürer: that of printing wood-cuts in two colours, and that of etching. His claim to the invention of the art of etching is however disputed, though it is not denied that he was the first who excelled in it.

Dürer wrote several valuable works on geometry, perspective, and fortification. He bestowed such labour on the purity of his native tongue that his writings even now are regarded well worth the study of the German scholar. In his private life Dürer was amiable, upright, and benevolent.

His life has been written by Arend and Roth, and lately by Heller, who has given the most critical and complete catalogue of all his works. Göthe, Tieck, Wackenrode, and other distinguished writers have vindicated his claims, which under the baneful influence of French taste had been so disregarded, that Dürer had come by his own countrymen to be regarded as a barbarian. Since the revival of German art, Dürer has been looked upon by all Germans as the great exemplar of national art.

D'URFEY, THOMAS, was born in Devonshire, but the exact time of his birth is uncertain. He was designed for the law, but quitted that profession for poetry. His dramas had remarkable success in the days of Charles II., but were soon afterwards banished from the stage on account of their outrageous indecency, and at present scarcely their names are known, except to the students of English dramatic history. Much of his fame was owing to his songs and satirical odes, which have a good deal of vivacity, and which he is said to have himself sung in a lively and agreeable manner. He is represented in the 'Guardian' as being on such terms of intimacy with Charles II., that the king would sometimes lean on his shoulder and hum tunes with

him: he was also a favourite at most convivial parties, and was so much celebrated for his qualities as a good companion, that it was considered a kind of honour to have been in his company. He however outlived his reputation, probably outlived also his convivial powers, and was reduced to such distress in the latter part of his life, that he applied to the managers of the theatre, who performed for his benefit one of his comedies, and Addison wrote a kind-hearted paper in the 'Guardian' to procure him a full house. The profits which were acquired seem to have been sufficient to render his last days comparatively easy, if any judgment is to be founded on his poems of this period, which are written with liveliness. He died in 1728, and was buried in St. James's, Westminster.

A collection of D'Urfe's poems, entitled 'Pills to purge Melancholy,' is extremely rare, and sells for a high price. It is much esteemed by those bibliographers who think licentious works valuable if they are but scarce.

DURHAM, JOHN GEORGE LAMBTON, EARL OF, was born at the family seat of Lambton Hall, or, as it is usually called, Lambton Castle, in Durham, on the 12th of April 1792. His father was William Henry Lambton, Esq.; his mother, the Lady Anne Barbara Francis Villiers, second daughter of George Busey, fourth Earl of Jersey. The family is said to have possessed its manor of Lambton ever since the 12th century, the male succession never having been interrupted since that remote date. The property was originally of inconsiderable value; the wealth of the family, arising principally from coal mines, dates from the time of Major General John Lambton, the late Lord Durham's grandfather, who succeeded to the estate in 1774, and died, at the age of eighty-four, in 1794. The Lambtons however had held an eminent place among the county gentry from the beginning of the last century; and either the head or some other member of the family represented the city of Durham in parliament from 1727 till the death of the late earl's father, at the age of thirty-three, 30th of December 1797, after he had sat in the House of Commons for about ten years. Mr. William Henry Lambton, who was, like his ancestors, a decided Whig, was an intimate friend and associate of Charles Fox, and the other leaders or chief members of his party; and he was also highly popular with his constituents.

The subject of the present notice was educated at Eton. On the 1st of January 1812, he was married at Gretna Green to Miss Harriet Cholmondeley, described in the 'Annual Register' as "daughter of the late celebrated Madam St. Alban;" and about the same time he is stated to have entered the 10th Hussars. By Miss Cholmondeley, who died 11th July, 1815, he had three daughters, who all died before himself, though not till after they had all attained the age of womanhood. On the 9th of December 1816 he married the Lady Louisa Elizabeth Grey, eldest daughter of Earl Grey.

Meanwhile, on the vacancy occasioned by the death of Sir Henry Vane Tempest, Bart., on the 1st of August 1813, Mr. Lambton had been returned to parliament for his native county. He very soon took a part in the proceedings of the House, his maiden speech having been delivered on the 12th of May 1814, in seconding an unsuccessful motion of Mr. C. W. Wynne, for an address to the Prince Regent against the annexation of Norway to Sweden. He continued to sit for the county of Durham so long as he remained a commoner, and, though he did not speak often, took a part in many important debates; opposing the new Corn Law Bill in 1815; opposing the additions made to the incomes of the royal dukes, and the continuance of the Alien and Bank Restriction Acts in 1816; opposing the Indemnity Bill demanded by ministers in 1818, and the six repressive bills brought in by the government after the great Reform meeting at Manchester in 1819; and by a plan of parliamentary reform which he submitted to the House on the 17th of April 1821.

His exertions in the House of Commons however began to relax under the pressure of ill-health; and his name is scarcely connected with any measure of consequence down to the great and eventually successful renewal of the Reform agitation in 1830. With the generality of his party, he supported both the Canning ministry of May 1827, and that of Lord Goderich, by which it was succeeded, in October of the same year; and on the dissolution of the latter, in January 1828, he was raised to the peerage with the title of Baron Durham of the City of Durham.

On the formation of the ministry of Lord Grey, in November 1830, Lord Durham was made Lord Privy Seal; and the preparation of the government Reform Bill was intrusted to four persons, of whom he was one, the others being Lord John Russell, Sir James Graham, and Lord Duncannon. It is known that Lord Durham proposed the introduction of the ballot into the scheme, and persuaded his colleagues to agree with him; but the ballot was excluded from the bill as actually drawn up and brought forward in the Commons by Lord John Russell on the memorable 1st of March 1831. A speech which Lord Durham delivered on the 28th of March, in the House of Lords, in explanation of the measure, was published. The plan reported by the four persons was also materially improved by making the qualification 10*l*. instead of 20*l*. He took no part in the discussion of the second Reform Bill in the House of Lords, where it was defeated on the second reading, on the 3rd of October. His eldest son, a beautiful boy, whose features will live for ever in the well-known picture by Lawrence, had died of consumption, at the age of thirteen, on the

24th of September. He spoke several times however in support of the third and last bill, which was discussed in the Lords in April and May 1832, and especially made a very able speech in committee on the 22nd of May, 'on the enfranchisement of the metropolitan districts,' which was published. On the 12th of March 1833 he resigned his office in the government, and three days after was made Earl of Durham.

In the summer of 1833 Lord Durham was despatched on a special mission to Russia, with the object of inducing the emperor to soften the severity of the proceedings against the unhappy persons who had been engaged in the late Polish insurrection; but it was not attended with any success. From the time of his return to England, after a few months' absence, he may be regarded as having more distinctly joined the section of the Liberal party which advocated still further reforms in the representation, and as having thus gone to a certain extent into opposition to the existing government. The difference of views that had arisen between his lordship and his former colleagues was proclaimed somewhat explosively at the great dinner given to Lord Grey at Edinburgh, on the 15th of September 1834; and he followed up this beginning by a succession of similar exhibitions in various parts of the country during the remainder of the year. A collection of his speeches upon these occasions was afterwards published. In 1835 however he was removed from that noisy scene by being a second time sent out to Russia, as ambassador at the court of St. Petersburg; and he retained that post till the summer of 1837, and made himself, it is said, extremely acceptable to the emperor.

Lord Durham's last political undertaking was perhaps his most important—the pacification of the troubles and dissensions of Canada, to which country he was sent out as high commissioner and governor-general, with extraordinary powers, in 1839. He arrived at Quebec on the 27th of May, succeeded in allaying the jealousies of the French party in Lower Canada, and published an act of indemnity for those engaged in the previous rebellious outbreak. But a misunderstanding or difference of views soon arose between him and the ministry at home; and, conceiving that he was not supported as he ought to be, without having been either recalled or having obtained leave to return, he re-embarked from the same port on the 1st of November following. His arrival in London on the 7th of December was speedily followed by the publication of a report addressed to the Queen, dated "London, 31st of January 1839," of great ability and interest, detailing the history of his colonial administration, vindicating his conduct, and explaining the principles on which he had proceeded, and on which he conceived that the management of the affairs of Canada ought to be conducted. But his unprecedented step of leaving his government without permission occasioned a rebuke, and he was not allowed to land under the usual salute. He in consequence made his wife resign her place in the Queen's household.

The state of his health now no longer permitted him to take any part in public affairs, at least beyond attending occasionally in the House of Lords. At last, early in the summer of 1840, he retired, with no hope of recovery, to the Isle of Wight; and he died at Cowes, on the 28th of July. A son, the present earl, and three daughters, one of whom is since dead, survived him.

DU SOMMERARD, ALEXANDRE, a French archaeologist, was born in 1779 at Bar-sur-Aube, département de l'Aube. At the age of fourteen he entered the republican army, and though in 1796 he withdrew from it in order to pursue a civil career, he was recalled and compelled to serve till 1801, when he was allowed to retire on his father consenting to occupy his post. He received an appointment in 1807 as member of the Cour des Comptes, an office he held till 1823, when he was raised to the post of conseiller référendaire, and made vice-president of the Electoral College of the Seine; in 1831 he was created chief conseiller. At the fall of Bonaparte he made himself conspicuous by his Bourbonism, and a song very popular with the partisans of the restored house, 'Rendez-nous notre Père de Gand !' was commonly attributed to him. His zeal, manifested in various ways, was recognised by Louis XVIII., who in 1816 conferred on him the cross of the Legion of Honour.

From an early period M. Du Sommerard had devoted all his leisure to the study of mediæval arts and antiquities, and as his means increased he applied himself with great zeal and industry to the collection of examples of the arts of that period. For this purpose he visited various parts of France, and employed persons to assist him in his inquiries and purchases. His collection, which soon became very rich in manuscripts, miniatures, arms, carvings, furniture, &c., he deposited in the ancient Hôtel de Cluny, of which he purchased a lease for that especial purpose; and in 1834 he published 'Notices sur l'Hôtel de Cluny et sur le Palais des Thermes, avec des Notes sur la Culture des Arts, principalement dans les quinzième et seizième siècles.' This work attracted general attention to the subject of the antiquities of France, and the government was led to appoint a 'Commission des Monuments Historiques,' and the 'Comité Historiques des Arts et des Monuments,' noticed under DIMON, with a view to the study and demand for the existing antiquities of France. M. Du Sommerard published his great work, partly the result of his early and various parts of his inquiries by the government commissions, 'Les Antiquités de Paris,' Paris, 1838-46. This splendid work is in 5 vols.

8vo, with an Atlas in folio of above a hundred plates, and an 'Album Supplémentaire' of more than five hundred plates, giving characteristic examples of the pictures, sculptures, monuments, stained glass, enamels, porcelain and earthenware, goldsmiths' work, illuminations and miniatures, arms, and furniture of the middle ages.

The prolonged and unceasing labours of M. Du Sommerard began at length to tell severely on his constitution. A journey which he made into Italy in 1842, for the purpose of adding to his collection, proved too much for his already-enfeebled strength, and shortly after his return to Paris he died, August 19, 1842.

After the death of M. Du Sommerard his fine collection was purchased by the government, and converted into a public museum. It remains in the Hôtel de Cluny, which became the property of the nation, and to which was adjoined the Palais des Thermes. Of these buildings, and of the Musée Cluny, M. Edmond Du Sommerard, one of the sons of the founder of the museum, was appointed director. (*Biographies des Hommes du Jour; Nouv. Biog. Générale.*)

DUSSEK, JOHANN LUDWIG, a celebrated musical composer and pianist, was born in 1761 at Czasaau in Bohemia. He was the son of an organist, and his father early instructed him in the principles of his art, so that at the age of nine he was a skilful player on the pianoforte and a good accompanist on the organ. He received further instruction in music from Spenaz, a musician of considerable note in his native place, and for his general education he was sent to the University of Prague. He afterwards filled the office of organist at Malines and at Bergen-op-Zoom. He then visited Amsterdam, where his playing on the pianoforte excited great attention, and where he made a somewhat prolonged stay. On quitting Holland he visited the chief cities of Germany, his reputation increasing as he proceeded. At Paris, where he was in 1788, his playing was so much admired that the queen, Marie-Antoinette, endeavoured to induce him to establish himself there; but alarmed at the threatening aspect of public affairs, he came to London in 1790, and here as elsewhere he immediately distinguished himself, and might have realised an ample fortune had his industry and discretion borne any proportion to his talents. Unfortunately he engaged in business, for which his habits were quite unfitted, and to escape from his creditors he in 1800 quitted England, and two years after became part of the household, and also the intimate and confidential friend, of Prince Louis Ferdinand of Prussia, who died so bravely at Saalfeld in 1806. He then entered into the service of Prince Talleyrand, in which he continued till his death in 1812. As a pianist, Dussek was in his day almost unrivalled. His style was large yet neat, and he was as effective in the most refined and delicate as he was in the grandest passages. His tone was exquisite, and his mechanical dexterity was remarkable. Dussek composed seventy-six pieces—including symphonies, concertos, sonatas, rondeaux, quintets, quartets, trios, variations, &c.—for the pianoforte; also some oratorios, several pieces of church music, and two unsuccessful operas. Amidst many that are of little or no value, there are some of Dussek's compositions for the piano that are in every respect excellent.

DUTENS, JOSEPH-MICHEL, the son of Michel-François, was born at Tours on October 15, 1765. He was entered when eighteen at the École des Ponts et Chaussées, and at twenty-two years of age he left it with the brevet of engineer. In 1800 he printed his first work at Evreux, 'Des Moyens de Naturaliser l'Instruction et la Doctrine,' and in the same year published a topographical description of the arrondissement of Louviers, in the département of Eure. In 1804 he gave to the world his first work on political economy, an analytical exposition of its fundamental principles. In 1818 he was commissioned by the government to travel in England in order to obtain a knowledge of the canal system there, and he extended his labours to all the great commercial works of the country, the results of which were published at Paris in 1819 in 'Mémoire on the Public Works of England.' The work is divided into two parts; the first is devoted to engineering, describing the canals, the works of art employed in their construction, the cost of making, the expense of maintaining, and the system of working; the second is principally to develop the mode of concession of public works in England, and its advantages in a country where the energies of association are in almost all cases employed instead of the intervention of the government.

Desirous of enabling his country to profit by his studies in England, Dutens published in 1829 a 'History of the Interior Navigation of France,' in which he gives a detailed description of the geographical features of France, and an account of its rivers and canals; with an analysis of the agricultural and industrial products of France, showing their value if made available by a network of canals, sketching a scheme of what should be the principal branches, and discussing the financial condition which would ensure its success. In 1835 Dutens published his greatest work, the 'Philosophy of Political Economy; or a new Exposition of the Principles of this Science,' in 2 vols. 8vo. It was an expansion with considerable modifications of his previous work, and occasioned much opposition from the economists of the school of Adam Smith. Blanqui says, "it is only a new edition of the doctrines of Quesnay, but with less of advancement in respect to commercial freedom and duties." The severe criticisms occasioned M. Dutens to publish in 1837 a defence of his work, and a second in 1839; and the contest was still going on when the Académie des Sciences

elected him a member of their body. He then published in 1842 his 'Essai comparatif sur la formation et la distribution du Revenu de la France en 1815 et 1835,' a work which contains the best statistical résumé of the productive riches of France, and has received and deserves high praise. In his last issued work, 'Des prétendues erreurs dans lesquelles, au jugement des modernes économistes, seraient tombés les anciens économistes relativement au principe de la richesse nationale,' in which he defends the theory of Quesnay, Turgot, and their followers, that manufactures and commerce do not constitute the wealth of a country, but that this advantage is only due to agriculture. M. Dutens died in 1848.

(*Nouvelle Biographie Générale.*)

DUTENS, LOUIS, was born at Tours, of a Protestant family, January 16, 1730. When about eighteen years of age he wrote a tragedy, the 'Return of Ulysses,' which met with success at Orléans, where it was played after being rejected by the managers of Paris. But Dutens did not repeat his dramatic venture. About this time a sister some six or seven years younger than himself was taken by order of the Archbishop of Tours and was shut up in a convent in order to force her to become a Roman Catholic, and Dutens disgusted with this tyranny left his country and came to England, where he found patrons, studied the oriental languages and mathematics, and travelled with several noblemen in succession over the Continent. He also acted for a time as secretary to the English minister at the court of Turin. On his return to England he was presented to the living of Elsdon in Northumberland. He was made member of the Royal Society of London, and of the Académie des Inscriptions et Belles Lettres of Paris. Being well versed in ancient and modern philology, and in archæology and numismatics, he wrote many works, the principal of which are:—1. 'Recherches sur l'Origine des Découvertes attribuées aux Modernes, où l'on démontre que nos plus célèbres Philosophes ont puisé la plupart de leurs Connoissances dans les Ouvrages des Anciens, et que plusieurs vérités importantes sur la Religion ont été connues des Sages du Paganisme,' 8vo, Paris, 1776. This work went through several editions, revised by the author, to the last of which, 1812, he added his 'Recherches sur le tems le plus reculé de l'Usage des Voûtes,' which he had previously published separately. In his zeal to vindicate the often-overlooked claims of the ancients to several discoveries which have been reproduced in modern times, Dutens oversteps at times the boundaries of sound criticism, and seems to wish to attribute almost every invention to the nations of antiquity. 2. 'Explication de quelques Médailles Grèques et Phéniciennes, avec une Paléographie Numismatique,' 4to, 1776, to which are added several previously-written dissertations on numismatics. 3. 'Itinéraire des Routes les plus fréquentées de l'Europe,' a work often reprinted. 4. 'Guide Moral, Physique, et Politique des Etrangers qui voyagent en Angleterre.' 5. 'Appel au Bon Sens,' a defence of Christianity against Voltaire and the Encyclopédistes. 6. 'Des Pierres précieuses et des Pierres fines, avec les Moyens de les connoître et de les évaluer,' Paris, 1776. 7. 'Histoire de ce qui s'est passé pour l'établissement d'une Régence en Angleterre,' 8vo, 1789. 8. 'Nouveaux Intérêts de l'Europe depuis la Révolution Française,' 1798. 9. 'Considérations Théologiques sur les Moyens de réunir toutes les Eglises Chrétiennes,' 8vo, 1798, a well meaning speculation towards a hopeless object. 10. 'Mémoires d'un Voyageur qui se repose,' 3 vols. 8vo, Paris, 1806, which contain anecdotes of Dutens's life and travels. Dutens died in London, May 23, 1812.

DUTROCHET, RENE-JOACHIM-HENRI, a distinguished French botanist and natural philosopher. He was born at the Château de Néon, Poitou, on the 14th of November 1776, and died at Paris on the 4th of February 1847. He was the son of a military officer, who emigrated, and whose property was confiscated. Young Dutrochet in 1799 entered as a private the military marine, but afterwards deserted. In 1802 he commenced at Paris the study of medicine. He made a brilliant career as a student, was created Doctor in 1806, and in 1808 was appointed physician to Joseph Bonaparte, king of Spain. He became principal physician to the Hospital of Burgos, which was then devastated with typhus. He displayed here great energy and skill. In 1809 he returned to France, and gave himself up to the study of those natural sciences for which his medical education fitted him. The tendency of Dutrochet's mind was to develop the laws which regulated the existence of organic beings, and many of his researches have had a permanent influence on the development of the departments of science to which they relate. His name is best known to physiologists from his researches on the passages of fluids through animal and vegetable membranes. The laws which he observed to regulate these phenomena he applied to the explanation of the functions of absorption and excretion in the animal and vegetable body. The passage of a fluid from without inwards he called 'endosmosis,' and the passage from within outwards 'exosmosis.' His views on this subject were published in a work which appeared both in London and Paris in 1828, with the title 'Nouvelles recherches sur l'Endosmose et l'Exosmose, suivies de l'application expérimentale de ces actions physiques à la solution du problème de l'irritabilité végétale et à la détermination de la cause de l'ascension des tiges, de la descente des racines.' The phenomena comprehended under the terms endosmosis and exosmosis were rightly described by Dutrochet, but he was hasty in tracing their cause to electricity, and failed to

see that they were parts of a much more general set of phenomena than he had described. His other papers are very numerous, and were on a variety of subjects not immediately related. Thus we find his inquiries embraced amongst other things the following subjects: a New Theory of Voice; a New Theory of Harmony; on the Family of Wheel-Animalcules; History of the Egg of the Bird; on the Envelopes of the Fœtus; Researches on the Metamorphosis of the Alimentary Canal in Insects; on the Structure and Regeneration of Feathers; on the Height of the Meteor which projected Aerolites at Charonville in 1810; on the Growth and Reproduction of Plants; on the Special Directions taken by certain parts of Plants. The results of all his labours and a connected view of the subjects to which he devoted his attention, he gave in a volume entitled 'Mémoires pour servir à l'Histoire Anatomique et Physiologique des Végétaux et des Animaux.'

DUVERNOY, GEORGES-LOUIS, a distinguished anatomist and zoologist. He was born at Montbéliard, then a dependency of the duchy of Wurtemberg, now an arrondissement in the department of Doubs in France, on the 6th of August 1777, and died at Paris on the 1st of March 1855. His father practised as a physician at Montbéliard, and he was brought up to the same profession. He commenced his studies at Stutgardt in 1792; but the principality of Montbéliard having been ceded to the French in 1793, he was compelled to finish his studies at Strasbourg. He subsequently went to Paris, where he graduated in 1801. In 1802 he was associated with M. C. Dumeril in reporting the lectures of Georges Cuvier, then in the zenith of his reputation. The 'Leçons d'Anatomie comparées' were concluded and published in 1805. On the completion of this labour he married, and, as natural science afforded him little hope of support for a family, he retired to his native town to practise his profession. In 1809 he was recalled to Paris, and named by De Fontanes joint professor of zoology in the faculty of science. Again however he returned to practise his profession in Montbéliard, and for nearly twenty years this distinguished zoologist pursued its harassing and laborious duties. In 1827 the chair of natural history in the faculty of science in Strasbourg was offered him: this he accepted; and from this time to his death we find him pursuing with unwearied industry zoological researches. In 1837 he was offered the chair of natural history in the College of France, vacated by the death of his great master, Cuvier. This chair he accepted, and held till 1850, when the death of De Blainville having created a vacancy in the chair of comparative anatomy he was appointed to it, and held it for four years. Duvernoy's contributions to zoological science are extremely numerous. In his writings and lectures he was more remarkable for the accuracy and extent of his knowledge than for the novelty and originality of his views. He was an industrious compiler, and was an extensive contributor to the 'Dictionnaire des Sciences Naturelles,' and also to the 'Dictionnaire Universelle d'Histoire Naturelle.'

DWIGHT, TIMOTHY, an eminent American Presbyterian divine, was born at Northampton in Massachusetts, May 14, 1752. His father was a merchant; his mother was daughter of the celebrated American theologian and metaphysician Jonathan Edwards. From infancy he made rapid progress in general and scholastic learning; inasmuch that, at the age of seventeen, very soon after taking the degree of B.A. at Yale College, Newhaven, he was appointed master of a grammar-school in that town, and, before he was twenty, one of the tutors of Yale College. He was licensed to preach in 1777, in which year, the sessions of the college having been stopped by the war of the revolution, he offered his services as chaplain in the American army. The death of his father in the following year rendered it desirable that he should return to Northampton, and the rest of his life was principally occupied in discharging the duties of tuition, first as master of a private seminary, next as president of Yale College, to which office he was appointed in 1795. He also held the professorship of theology. He died January 11, 1817.

His early life was extremely laborious. It is stated that while he kept school at Newhaven his time was regularly divided: six hours of each day in school, eight hours in close and severe study, and the remaining ten hours in exercise and sleep. ('Life,' p. 20.) Over-exertion nearly brought on blindness; from the age of twenty-three he was continually subjected to acute pain behind the eyes, and was unable for the space of forty years to read longer than fifteen minutes in the day. This makes the extent and variety of his knowledge, which was acquired almost entirely through the ear, the more remarkable; and the mastery which he acquired over his mental powers by discipline was so complete that he could dictate two or three letters to different amanuenses at once, and he seldom forgot or found difficulty in producing any fact which was once stored in his memory. In 1774 he resorted to a severe system of abstinence in food and exercise, which had nearly proved fatal. He recovered a vigorous state of health, chiefly by returning to a daily course of strong exercise, and the benefit thus derived led him in after-life to devote his recreations regularly to a series of excursions, of which we have the fruits in his 'Travels in New England and New York,' 4 vols. 8vo, 1823. These contain a great quantity of statistical and topographical information, which, considering Dr. Dwight's mental habits and opportunities, there is every reason to presume represent accurately the condition of the country during the first quarter of the present century. The

historical parts, especially those relating to the Indian history, manners, and warfare, are of much interest. Dr. Dwight's earliest publication, was an epic entitled the 'Conquest of Canaan,' finished in his twenty-second year, and he subsequently published several other volumes of religious verse, which were read in their days, but have long since passed into oblivion. His chief work is his 'Theology Explained and Defended in a Series of Sermons,' 5 vols. 8vo. It is a course of 173 lectures, delivered by him as professor of divinity on the Sundays in term-time, so as to occupy about four years. His method of preaching was from very concise notes or heads, his eyes not permitting him to undergo the labour of writing; so that this voluminous body of divinity was not committed to paper till 1805, in which year he was provided with an amanuensis at the expense of the college. Two more volumes of his sermons, fifty-nine in number, were published in 1827, and many sermons, essays, &c., remain unpublished. Dr. Dwight was a pleasing as well as a prolific writer; but he had little originality or depth of thought, and his florid, diffuse, and uncritical writings are not likely to be of lasting reputation. Dr. Dwight is said to have been eminently a useful and effective as well as a learned preacher, and his life bore witness to the efficacy of his own belief.

(Life, prefixed to his *Theology Explained*.)

* DYCE, REV. ALEXANDER, was born in Edinburgh in 1798, and in the High School of that city he received the early part of his education. Being intended for the church, he proceeded to Exeter College, Oxford; was ordained, and officiated for several years as a curate in Cornwall and Suffolk. In 1827 he came to reside in London, and entered upon a literary career, in which his general learning and critical acquaintance with old writers have gained him a well-merited distinction. His first publication was 'Select Translations from Quintus Smyrnaeus,' followed by an edition of the poems of Collins, and 'Specimens of British Poetesses.' Of our elder dramatists, his editions of Peele, Greene, Webster, Middleton, Beaumont and Fletcher, and Marlowe and Shirley, display great research and critical sagacity, and are now recognized as the standard editions. Mr. Dyce has likewise edited the poetical works of John Skelton, and contributed memoirs to the editions of Pope, Collins, Beattie, Akenside, and others, for the 'Aldine British Poets,' published by Mr. Pickering. The critical and theological works of Bentley were also published by Mr. Dyce. As a commentator upon Shakspeare, he has produced 'Remarks on Collier's and Knight's Editions of Shakspeare,' 'A Few Notes on Shakspeare,' and a volume examining some of the emendations proposed by Mr. Collier, on the authority of the manuscript corrections he discovered on a copy of the second folio. In these publications Mr. Dyce not unfrequently injures the real value of his own knowledge by displaying something of the same sneering and self-satisfied temper with which Stevens was accustomed to assail his brother commentators. Mr. Dyce is a member of several literary societies, and has edited Kemp's 'Nine Days' Wonder' for the Camden Society; 'Timon' and 'Sir Thomas More,' two tragedies, for the Shakspeare Society; and some tracts for the Percy Society.

* DYCE, WILLIAM, R.A., was born in Scotland early in the present century. He received his education in art at the Scottish Academy, and at the academy's exhibition in 1827 made his first public appearance as a painter of classical subjects. For more prosaic patrons he painted portraits. Some three or four years later Mr. Dyce appeared as a contributor to the Royal Academy, London, without attracting much notice, though his career was watched by his countrymen with some interest. He gradually made his way as a correct draughtsman and a careful painter, with aspirations towards a high class of art; and when it was proposed to impart to the new School of Design at Somerset House a really artistic character, Mr. Dyce was selected as the head-master. This office he retained only about three years—too brief a time to effect any real good, but a rather long period for that very variable institution. On his return to the undivided pursuit of his profession, he showed that the interval had not been ill-employed. His contribution to the Exhibition of 1844 was a work more original and characteristic, and far more effective, than any he had hitherto painted, 'King Josiah Shooting the Arrow of Deliverance,' and its purity of style and admirable execution at once secured Mr. Dyce admission as an Associate within the coveted precincts of the Royal Academy. He had in fact not only been, as his style showed, studying the works of the eminent living German historical painters, but he had also been making himself master of their methods of fresco-painting, of his skill in which art he exhibited some examples at the Fresco Exhibition in the same year. These, parts of a large historical composition, were regarded as among the most successful specimens sent to Westminster Hall. Soon after Prince Albert gave him a commission to paint in fresco one of the compartments of his summer-house at Buckingham Palace, and subsequently he was employed to execute some fresco-paintings at Osborne. Mr. Dyce was also one of the first artists employed upon the new Palace of Westminster. In the House of Lords his fresco of the 'Baptism of Ethelbert' is generally regarded as one of the best paintings in the room. So much indeed was it approved of by the authorities, that Mr. Dyce has since been pretty constantly employed in adorning the walls of that vast building. The Queen's robing-room is being entirely painted by him.

Mr. Dyce's occupation at the houses of parliament has interfered of

course with his practice as a painter of cabinet and gallery pictures, and his contributions to the Royal Academy exhibitions during the last ten years have been somewhat scanty. In 1846 he sent a 'Madonna and Child,' in 1847 only a sketch. The next year he was elected R.A., and signalled his accession of dignity by sending to the exhibition an 'Omnia Vanitas,' and another sketch for a fresco. In 1850 he contributed a 'Meeting of Jacob and Rachel,' of which subject he sent another version in 1853. The only other pictures which have appeared from his easel are—'King Lear and the Fool in the Storm' (1851); 'Christabel' in 1855 (a very nice German face, very nicely painted in the German manner, but certainly not the Christabel of Coleridge); and the 'Good Shepherd' (1856).

DYER, GEORGE, was born in London on the 15th of March, 1755. He was educated at Christ's Hospital, where, when his standing in the school gained him access to the library, he acquired that taste for extensive reading which produced the works that will preserve his name: he was at the school from the age of seven to nineteen. While at school he was much noticed by Dr. Aakew, physician to the hospital, at whose table he was a frequent guest, in company with much of the distinguished part of the literary world. In 1774 he entered at Emanuel College, Cambridge, and took the degree of B.A. in 1778. After being for a time usher at a free grammar school and several others, he returned to Cambridge, not taking up his residence in college, but, having become a Baptist, in the family of his friend the Rev. R. Robinson, the Baptist minister, as tutor to his children and pupil of their father. He next officiated for some time at Oxford as a Baptist minister; but after relinquishing this duty, and again residing for some time in Cambridge, he finally settled in London in 1792. From that time till 1830 his time was employed at first as a reporter in the House of Commons (which occupation he abandoned after two months' trial of it), afterwards as a private teacher, finally in various literary undertakings presently mentioned. In 1830 his eyesight gradually failed, and at length he became totally blind. He died at his chambers in Clifford's Inn, on the 2nd of March 1841.

Dyer was a poet, a scholar, and an antiquarian, deeply versed in books and their history. As a poet he attracted notice, but not fame; as a scholar he edited some plays of Euripides and an edition of the Greek Testament; but he is best known as editor, or joint editor, of Valpy's combination of the Delphin, Bipont, and Variorum editions of the Classics, in a hundred and forty-one volumes, in which all the original matter and 'additamenta,' except the preface, were contributed by him. As an antiquary his principal works are—'History of the University and Colleges of Cambridge,' 2 vols. 8vo, London, 1814; 'Privileges of the University of Cambridge,' 2 vols. 8vo, London, 1824; the first volume containing the charters, statutes, &c., the second being a supplement to the history; and in connection with these, 'Academic Unity,' 8vo, London, 1827, being a translation with additions of the 'Dissertatio Generalis' in the second work. Dyer published a 'Life of the Rev. Robert Robinson,' and many other works of less note (a list of which is in the postscript of the second volume of the 'Privileges,' &c., just mentioned), and was a large contributor to the magazines.

Dyer was a man of a remarkable single-mindedness and simplicity of character; and not only remarkable, but remarked and recorded, and that in a singular manner, by his friend Charles Lamb (so well known under the signature of 'Elia') in the 'London Magazine' for October and December 1823, and republished in the 'Essays of Elia.'

Dyer's 'History of Cambridge' is rather a sketch than a history; but it is the sketch of a man who had all the reading necessary for writing the history; and it may be added that the materials for the early annals of the university are very defective. Dyer has given a good account of his materials; but it is much to be regretted that he has not made more specific references to them in the body of the work. It will be found however, on examination, to be the work not only of a laborious but of a very honest man—for to this character he has a most unimpeachable title—and as such the 'History of Cambridge' is a very important addition to what existed on the subject; and nothing but the opportunities of a Wood will surpass it.

DYER, JOHN, born in 1700, was the second son of a respectable solicitor of Aberglasney in Caermarthenshire. He received his education at Westminster school, and when that was completed, began the study of the law. An early taste for poetry and painting led him to relinquish his legal pursuits, and he travelled about South Wales in the capacity of an itinerant painter. At this period he wrote his poem 'Grougar Hill,' which was published in 1727. Though he seems to have made but small proficiency in painting, he went to Italy to study, where he wrote the 'Ruins of Rome,' a descriptive poem, published in 1740. On his return to England, having a small independence, he retired into the country, entered into holy orders, and married a lady named Ensor, whom he states to be a descendant of Shakspeare. He was a man of excellent moral habits, of a singularly modest and unambitious temper, and strongly imbued with the love of a country life. He died in 1758, shortly after the publication of his longer poem, 'The Fleecce.'

'The Fleecce' is a long poem, of a purely didactic kind. The middle of the last century was remarkably prolific in poems which took for their model Virgil's 'Georgics.' Dyer's 'Fleecce,' Grainger's 'Sugar-cane,' and Phillips's 'Cyder,' are all of this class. By selecting

subjects essentially unpoetical, whatever might be the ingenuity of the writers, they could do no more than make a tolerable poem of a bad kind; for they did not confine themselves to a mere outline of the subject, which they might fill up with what colouring they pleased, but essayed to give, in a poetical form, the intricacies and minutiae of various branches of manufacture. The selection of Virgil's 'Georgics' for a model was in itself a fallacy, as we question whether this work, with all its beauties, would be much read at the present time were it not for the opportunity which it affords of studying one of the most elegant writers of the Augustan age, and for the light it throws on the agriculture of the ancients. But Dyer's 'Fleece' contains many very pleasing passages of description, and there is about it, as in all of his poems, a simple, unassuming, unaffected strain of genuine, though it may be somewhat humble, poetic feeling. The 'Ruins of Rome,'

though less elaborate, is of a higher order. It displays considerable imagination and a fine and well cultivated feeling for the beauty and harmony of nature; and the descriptions are imbued and vivified with a pure tone of moral sentiment. Perhaps his most popular, though his least thoughtful and least finished poem, is his earliest one — 'Grongar Hill.' There is perhaps no new idea in this work, but it is a vivid and brilliant combination of pleasing images. The poet invokes the muse to "draw the landscape bright and strong," and the muse seems to grant his request. We may conceive the poem to be the work of a man walking up-hill, and struck with the succession of scenery which opens all around, he says the first thing that comes into his head; and as he is affected by none but beautiful prospects, what he says is sure to be pleasing.

E

EADMER, or **EDMER**, the friend and historian of Archbishop Anselm, lived in the 12th century, but we have no information respecting his parents, or the particular time and place of his nativity. He received a learned education, was a monk of Canterbury, and became the bosom friend and inseparable companion of two archbishops of that see, St. Anselm and his successor Ralph. To the former of these he was appointed spiritual director by the pope. In 1120, by the desire of Alexander I. of Scotland, he was elected Bishop of St. Andrews; but on the day of his election a dispute arose between the king and Eadmer respecting his consecration. Eadmer wished to be consecrated by the Archbishop of Canterbury, who, he contended, was the primate of all Britain; while Alexander contended that the see of Canterbury had no pre-eminence over that of St. Andrews. Eadmer finally abandoned his bishopric and returned to England, where he was kindly received by the archbishop and clergy of Canterbury, who yet thought him too precipitate in leaving his bishopric. Eadmer at last wrote a long and submissive letter to the king of Scotland, but without producing the desired effect. Wharton fixes his death in 1124, the very year in which the bishopric of St. Andrews was filled up. Eadmer is now best known for his history of the affairs of England in his own time, from 1066 to 1122, in which he has inserted many original papers, and preserved many facts which are nowhere else to be found. His style is regular and good, and his work more free from legendary tales than is usual with the works of his time. The best edition is that by Selden, entitled 'Eadmeri Monachi Cantuariensis Historie Novorum, sive sui Seculi, Libri Sex,' folio, London, 1623. His life of St. Anselm was first printed in 12mo, at Antwerp, in 1551, under the title of 'Fratris Edmeri Angli de Vita D. Anselmi Archiepiscopi Cantuariensis, Libri duo.' Several others of his works, with the 'Historia Novorum,' were edited by the congregation of St. Maur at the end of Father Gerberon's editions of the works of St. Anselm, fol. Par., 1675 and 1721. His lives of St. Wilfrid, St. Oswald, St. Dunstan, &c., with that of St. Anselm, were inserted by Wharton in his 'Anglia Sacra.'

EARLE, JOHN, was born at York about 1601. Being sent to Oxford, and entered as a commoner at Christchurch College, he was afterwards, in 1620, admitted as a probationary fellow on the foundation of Merton College. He took the degree of Master of Arts in 1624, and that of Doctor in Divinity in 1642. About 1631, when he was proctor, he was appointed chaplain to Philip, earl of Pembroke, who was then chancellor of the university, and lord chamberlain of the king's household. The earl presented him to the rectory of Bishopstone in Wiltshire, and to the same influence probably he owed also his appointment to be chaplain and tutor to Prince Charles, and chancellor of the cathedral of Salisbury. Of all these preferments he was soon deprived by the civil wars. After the battle of Worcester he fled from England, and, meeting Charles II. at Rouen, was made his chaplain and clerk of the closet. Earle remained abroad during the whole exile of his master. Immediately after the Restoration he was made Dean of Westminster. In 1662 he was consecrated Bishop of Worcester, whence he was translated in the next year to the see of Salisbury. He continued to attend much at court, and on the breaking out of the plague in 1665, he accompanied the king and queen to Oxford, where, in University College, he died on the 17th of November in that year. His tomb stands near the high altar of Merton College Chapel. Bishop Earle was a zealous cavalier and staunch high-churchman, but is represented on all hands, by Baxter as well as others, as having been a man of moderate and kindly dispositions. He is now remembered on account of his work called 'Microcosmography, or a Piece of the World discovered, in Essays and Characters,' 8vo, 1628. This volume was several times reprinted with additions in the author's own lifetime, the eighth edition appearing in 1650. The edition by Dr. Bliss, 1811, 12mo, is the eleventh, and contains notices of the author's life and of his other works, with several small English poems of his, and specimens of his Latinity. Except these little pieces, and the 'Microcosmography,' he published nothing but a Latin translation of the Icon Basilike; 'Εἰκὼν Βασιλική, vel Imago Regis Caroli, in Illis suis Ærumnis et Solitudine,' Hague, 1649, 12mo.

Wood mentions an unprinted Latin translation of Hooker's 'Ecclesiastical Polity' by him, which however has not been seen by any one in modern times. Earle's 'Microcosmography' is one of the best, as it was one of the most popular, among the brief sketches of character and manners which were so abundant in our literature for a century after the middle of Elizabeth's reign, and which, receiving the addition of narrative matter, were transformed, in the beginning of the 18th century, into the little novels of the 'Spectator' and other periodical works. The bishop's portraits, especially the ethical ones, abound both in shrewdness and in humour, and are very often expressed with great terseness and epigrammatic point.

EARLOM, RICHARD, one of the most distinguished English engravers of the 18th century, was born in the early half of that century, and, according to Bryan, was still living in 1816. A few foreign works speak more definitely of the when and whereabouts of Earlom's birth, but they are at the same time vague and contradictory; some state that he was a native of Somersetshire, others that he was born in London about 1728. The dates of his works, which are very numerous, range between 1760 and 1790. As a mezzotint engraver Earlom has scarcely been equalled; his historical and other figure pieces in this line are excellent, but some fruit and flower pieces, after Van Os and Van Huysum, are of unrivalled beauty and effect. Earlom also executed many etchings and imitations of chalk drawings, the principal of which is the celebrated 'Liber Veritatis,' published by Boydell, consisting of a series of fac-similes from the original sketches of Claude Lorraine, in the possession of the Duke of Devonshire. He engraved from a great variety of masters, English and foreign, as Correggio, Ann. Caracci, Domenichino, Guido, Guercino, Carlo Dolci, Luca Giordano, S. Cantarini, Quintin Matsys, Hemskerck, Teniers, Snyder, Rubens, Vandyck, Rembrandt, Vanderwerf, Velazquez, Mengs, Zoffany, Reynolds, Louthborough, West, Wilson, Gainsborough, Joa. Wright, Northcote, Romney, &c. &c. Among his masterpieces are—the 'Royal Academy,' after Zoffany; 'Lord Heathfield,' after Reynolds; and the 'Iron Forge,' after Wright. There is a list of his principal works in Bryan's 'Dictionary of Painters and Engravers.'

* **EASTLAKE, SIR CHARLES LOCK, P.R.A.**, was born in 1793 at Plymouth, Devonshire. Having, after the usual course of education at the grammar schools of Plymouth and Plympton, and for a brief space at the Charterhouse, decided on adopting painting as a profession, he entered as a student at the Royal Academy, London, where under Fuseli he considerably distinguished himself. At this time too he availed himself of the advice and experience of his fellow townsman, Haydon. Soon after completing his preparatory studies, Mr. Eastlake visited Paris in order to study and copy some of the many great works which Napoleon had collected in the Louvre. His labours were however interrupted by the Emperor's return from Elba, and he came back to England and established himself at Plymouth as a portrait-painter. When the Bellerophon lay off Plymouth with Bonaparte on board of it, Mr. Eastlake made sketches of him as he walked the deck from a boat, and from these painted a full-length portrait of the fallen emperor—the last painted from him in Europe. Mr. Eastlake in 1817-18 visited Italy, Greece, and Sicily; and then settled for some time in Rome. In 1823 he sent to the exhibition of the Royal Academy some views of Rome and its neighbourhood. These were followed by various pictures of the peasantry of Italy and Greece, chiefly what have been called costume pieces, but some of them—as the 'Brigand's Wife Defending her Wounded Husband,' 'Byron's Dream' &c.—of a somewhat more ambitious character. In 1827 he sent to the exhibition a painting of the 'Spartan Isidas,' and he was the same year elected an Associate of the Royal Academy. The following year he contributed his 'Peasants on a Pilgrimage to Rome first coming in sight of the Holy City,' a work which showed a far greater amount of power than any he had previously painted, and in fact formed one of the leading features of the year's exhibition. This admirable picture has been two or three times engraved, and Mr. Eastlake has painted a duplicate of it with some variations. In 1830 Mr. Eastlake was elected R.A. For several seasons his contri-

butions to the Academy exhibitions consisted chiefly of Italian and Greek subjects, such as the 'Contadina and Family returning from a Festa—prisoners to Banditti'; 'Gaston de Foix before the Battle of Ravenna, in which he was slain'; 'Salutation of the Aged Friar,' &c. He at length sent a work of much more elevated aim, his now universally known 'Christ Weeping over Jerusalem.' This, though of but moderate size, was really one of the most important productions in the historical style which the English school had for a considerable period produced. With the utmost refinement and purity, there was combined a deep religious earnestness of character and expression, breadth and simplicity of treatment, and subdued but rich colour; and the well-filled canvass had neither figure nor feature to let, or in the way. And whilst every part was finished with the most scrupulous care, there were no ostentatious details, no coat-trimmings, or pebble-stones, or wall-lichens set forth with the pedantry of a collector or the fussiness of an antiquary. The deep sentiment of the picture found its way to every heart; and many hoped that it was the inauguration of a new and nobler school of English historical painting. The 'Christ Blessing Little Children,' and the 'Hagar and Ishmael,' however admirable, as in many respects they both were, did not certainly increase, if indeed they sustained, the high reputation acquired by the 'Christ Weeping over Jerusalem.' There were all the refinement and purity of that work, but the delicacy verged on feebleness, and the colour was less true and powerful. But Mr. Eastlake's energies had been diverted away from constant attention to his art, and art is too jealous a mistress to allow of a divided service.

In 1841 Mr. Eastlake was appointed Secretary to the Royal Commission of Fine Arts, formed for inquiring whether advantage might not be taken of the opportunity afforded by the rebuilding of the houses of parliament for promoting and encouraging the fine arts. The direction of the proceedings of this commission, the laborious collection of materials for arriving at a decision as to the best means of carrying out the purpose for which the commission was appointed, the investigations respecting the history and processes of fresco-painting, and other connected matters, occupied for some years a considerable portion of Mr. Eastlake's time; and to his zeal and unselfish exertions much of the success of the commission was due. The reports presented by the commission to parliament represent but a small portion of Mr. Eastlake's labours as its secretary, an office he still retains. In November 1843 Mr. Eastlake was appointed Keeper of the National Gallery, but resigned in October 1847.

Mr. Eastlake exhibited his 'Hagar and Ishmael' in 1844; his subsequent works have been comparatively few. In 1845 appeared 'Heloise,' one of the female heads he always paints so gracefully; in 1844 a 'Scene from Comus,' a study for a royal fresco; in 1846 'A Visit to the Nun,' 'An Italian Peasant Family—prisoners with Banditti' in 1848; 'Helena' in 1849; 'The Good Samaritan,' and 'The Escape of Francesco Novello di Carrara, with Tadden d'Este, his wife, from the Duke of Milan,' in 1850; 'Ippolita Torelli' in 1851; 'Ruth sleeping at the feet of Boaz' and 'Violante' in 1853; 'Irene' in 1854, and 'Beatrice' in 1855. Mr. Eastlake has also exhibited a few portraits, one of which 'The Sisters' may be mentioned as almost unrivalled among modern female portraits for exquisite gracefulness and refinement of style.

In 1850 Mr. Eastlake was elected President of the Royal Academy, and at the same time he received the honour of knighthood. In 1855 he was appointed to the newly-established post of Director of the National Gallery with a salary of 1000*l.* a year. This appointment, as well as his previous management as Keeper of the National Gallery, has been the subject of a series of attacks on Sir Charles, made with so much virulence and personality as to have despoiled them of their sting, and rendered them far more hurtful to their utterers than to the object of their enmity. Sir Charles was in 1838 elected a Fellow of the Royal Society; in 1853 he received the degree of D.C.L. from the University of Oxford; and in 1855 he was created Knight of the Legion of Honour.

Sir Charles is not only one of the most able but also one of the most learned of living English painters, and he has made several valuable contributions to the literature of art. For the 'Penny Cyclopædia' he wrote the articles 'Bassi-Rilievi' and 'Bologna, School of.' He has also written some excellent articles for the 'Quarterly Review'; and some elaborate papers on Fresco painting, &c. for the Reports of the Fine Arts Commission. His separate publications consist of a translation of Goethe's 'Farbenlehre,' 1 vol. 8vo, 1840, which he has enriched with some valuable notes on the practice of painting and the vehicles employed by the great Venetian and Flemish painters—subjects he has much more amply illustrated in his next work, 'Materials for a History of Oil-Painting,' 1 vol. 8vo, 1847. His scattered essays he has collected under the title of 'Contributions to the Literature of the Fine Arts.' Sir Charles has also edited and annotated a translation, said to be by Lady Eastlake, of 'Kugler's Handbook to the Italian Schools of Painting.'

A repetition of Eastlake's grand picture 'Christ Weeping over Jerusalem,' forms one of the chief features of the Vernon Gallery, in which collection are also his 'Escape of Francesco di Carrara,' and a 'Head of a Lady in Greek Costume.' These have all been engraved among the series of engravings from the Vernon Gallery in the 'Art Journal'; the 'Christ Weeping over Jerusalem' has also been admirably

engraved on a much larger scale by Mr. Cousin in mosaic. 'The Pilgrims first coming in sight of Rome,' 'Hagar and Ishmael,' and 'Christ Blessing Little Children,' have been engraved in line.

EBEL, JOHN GOTTFRIED, an esteemed writer on statistics and geology, born at Frankfurt-on-the-Oder, October 6, 1764; died at Zürich, 1830. After completing his studies and taking his degree as Doctor of Medicine, he went to France, and became intimate with the Abbé Sieyès. In 1801 he went to Switzerland, and resided chiefly at Zürich. He travelled through Switzerland in all directions, and published some valuable works on the natural history and statistics of the country. The most popular is his 'Guide to Travellers in Switzerland.' In his description of the mountaineers of Switzerland, he draws an interesting picture of the inhabitants of Appenzel and Glarus. His work on the geology of the Alps touches also on the structure of the globe in general; and contains much information on the geological relations of the Alps.

EBELING, CHRISTOPHER DANIEL, born 1741, at Garmisen in Hildesheim; died in 1817. He studied theology at Göttingen, and acquired great knowledge of the oriental languages, especially the Arabic, and was thoroughly acquainted not only with the classical literature of Greece and Rome, but also with that of modern Europe, particularly England. He published numerous translations, &c., but his chief work is his 'Geography and History of the United States of North America,' 7 vols. 8vo, which was justly esteemed, not only in Europe, but still more in America itself. He was chosen a member of almost all the learned societies of the country, and the Congress voted him public thanks for his services. That part of his library which related to America, consisting of 3900 volumes, was purchased after his death by M. Israel Thoreldino, a friend of learning, at Boston, and presented to Harvard College. Ebeling was for thirty years professor of history and of the Greek language in the gymnasium at Hamburg. His industry was extraordinary. Besides the duties of his professorship and the composition of his chief work, he was for above twenty years keeper of the public library of the city, into which he introduced order and judicious arrangement, and composed a catalogue, which was much wanted. He besides contributed largely to numerous periodicals. He was of a friendly, cheerful, and social disposition; and he bore with remarkable patience and equanimity for thirty years a hardness of hearing, which gradually increased to almost total deafness, so that a loud voice was scarcely perceptible to him even with the aid of an ear-trumpet.
